The Nation.

NEW YORK, THURSDAY, JULY 1, 1897.

The Week.

The temperate statement of the Japanese position respecting our Hawaiian treaty sets out forcibly the rough over-riding of Japanese rights which President McKinley proposes, and contains, in addition, one assertion which ought to bring a blush to every American cheek still capable of blushing. It is that the Japanese Minister in Washington was deceived by our Government. He had inquired at the State Department as to the intention of the Administration in regard to Hawaii, and had been informed that no treaty was in preparation or even in contemplation. Judge, then, of the sensations of this heathen when the rulers of a Christian nation, in the face of their promise, suddenly produced a treaty as absolutely ignoring the interests of 24,000 of his fellow-countrymen as if they had been simply so many wild beasts infesting the islands. The explanation is simple, though we fear it will not seem so to the untutored heathen or to the trained diplomat. When Mr. McKinley assured the Japanese Minister, as he had assured others, that he would have nothing to do with Hawaiian annexation, he did not dream that the Senate would pull him about so quickly. If he had foreseen how annexation would get tangled up with the sugar schedule, he would have been more guarded. Of course, no promise, no international understanding can hold good for a day as against a tariff exigency. Our Government had not the slightest intention of tricking the Japanese; there is nothing Machiavellian about Mr. McKinley—he was not trying to lull the Japanese Minister to sleep with false pretences. He simply forgot that the tariff and the Senate might compel him to break his promises. It will be a useful lesson to foreign ministers in Washington. They will understand hereafter that all agreements with this country are binding on us only so long as some unexpected hitch in the tariff does not force us to violate them.

Mr. Morgan has introduced in the Senate a bill to annex Hawaii, which is designed to bring the Sandwich Islands under the dominion of the United States, treaty or no treaty, by March 4, 1898, or earlier if Congress so decides. Mr. Morgan says that his bill is intended to carry the annexation treaty into execution in case it shall be ratified by the Senate, or to provide for its ratification by the joint action of the two houses in case the Senate shall refuse to act. "The treaty," he says, "can be ratified in this form, by a majority vote in each of the two houses, thus avoiding the necessity for securing two-thirds of the Senate, as would be required if the matter should be passed upon by that body alone." So far as procedure goes, Mr. Morgan would seem quite justified in his attempt. There is nothing in the Constitution which says that countries must be annexed by treaty. They may be annexed by law just as well; in fact, so far as the mere act of taking and holding goes, the President might annex by means of a few battle-ships. The difficulty with Mr. Morgan's bill is that it "antagonizes" the President's treaty, and puts Mr. Morgan instead of the President in the position of the great annexer. There is no doubt that Mr. Morgan can give Mr. McKinley "points" on a vigorous foreign policy.

The Republican State convention in Ohio opened most discouragingly with a ranting speech by Congressman Grosvenor, admirably calculated to drive away the whole body of independent voters—if there were any place for them to go. It was only through their support last fall that McKinley carried his own State by the relatively small plurality of 48,494, as against 268,469 in New York, and 142,607 in Illinois. Yet Mr. Grosvenor took especial pains to sneer at this body of voters who were so indispensable last fall, and who are so necessary to success again this year, talking about "the howl of the Mugwumps." Not content with abuse of the Independents as a force in politics, he sought to show that they had gained nothing, and could expect to gain nothing, in the way of financial reform from giving the Republicans control of the national administration. He condemned the Democrats for "taking their stand firmly upon the foundation of a 50-cent dollar and the depreciation and degradation of the coinage of the country," but the only evidence which he had to present that the Republicans had taken a firm stand for a 100-cent dollar was his "pointing with pride" to the sending abroad of a ridiculous commission in what everybody knows to be a hopeless search after an international agreement on bimetallism.

No gathering of Republican leaders in Ohio is ever complete without a factional controversy and well-sustained charges of treachery. The usual performance was again enacted when the delegates assembled in Toledo on June 23. Gov. Bushnell is to run for re-election, and Mr. Hanna is the Republican candidate for the Senate. Each distrusts the other, and each is afraid to leave the conduct of the campaign as chairman of the State committee to a representative of the other, for fear of being "knifed." Bushnell's man for chairman was Kurtz, and Hanna's was Dick. Each vowed that he would not surrender, but the Governor finally had to yield. Hanna not only got away a majority of the State committee, but he had come into possession of several letters that Kurtz had written, in which the Senator was arraigned severely, and he declared that no personal enemy, such as Kurtz had proved himself to be, should be placed in a position of such power and responsibility. Bushnell could not offer in rebuttal any letters of Dick arraigning the Governor severely, and there was nothing for him to do but to "take his medicine" and let the Senator run the campaign.

Senator Hanna's "dodge" of evading all expressions of opinion on the currency question in 1897 by "reaffirming allegiance" to the national platform of last year is undoubtedly very ingenious. But when he had the Ohio convention resolve that the national platform of last year "declares the true principles and policy of the Republican party," and that "to all the declarations of that platform we pledge anew our allegiance," he apparently forgot one of those declarations. The St. Louis platform contained this plank:

> "The civil-service law was placed on the statute-book by the Republican party, which has always sustained it, and we renew our repeated declarations that it shall be thoroughly and honestly enforced and extended wherever practicable."

The extensions of the reform system made by President Cleveland during the last year of his term came almost simultaneously with this declaration, and were in consonance with its spirit. Yet the Republican platform adopted at Toledo contains a resolution that "we denounce the vitiation of the spirit of the civil-service act by President Cleveland in those orders which extended its operation beyond its purpose and intent, and demand such revocation of orders or modification of the law as will accomplish its manifest purpose." A more cynical repudiation of pledges could not be conceived.

The wool schedule adopted by the Senate last week marks the almost complete triumph of the "Rocky Mountain sheep" and the almost complete defeat of the woollen manufacturers. Nobody can seriously regret the latter. It is the result of sitting down to supper with the devil while not having a long enough ladle. There is still talk of giv-

ing the manufacturers "compensatory" duties, but what can compensate them for not being able to get the wool they need? This kind of protection is a perfect illustration of Cecil Rhodes's cynical definition, that it is the fiscal system which makes goods dear and nasty. If the manufacturers had made a square and open fight, they might, at least, have won sympathy in their misfortunes; but they have trusted to intrigue and dickering, and the dickering has gone against them. The spectacle of Senators Quay and Penrose trying in vain to save the high-protection Philadelphia carpet-manufacturers from being hoist with their own petard, must have rejoiced the souls of the wool-growers. They are at last commending the Pennsylvania chalice to the lips of Pennsylvania. As for Mr. Dingley, he will now have to come out of the brush. He had the effrontery to defend in public the rates which the Western Republicans wrote in his bill, and which he, as a woollen manufacturer, knew would be disastrous, while privately begging fellow-manufacturers to come to Washington and make the Senate undo the outrage. Well, the Senate has finally made the outrage several degrees more outrageous, and what is Mr. Dingley going to do about it? Probably nothing, except join Senator Quay in seeing what "strategy" can do in conference committee.

Senator Platt of Connecticut made on Thursday a much-needed "explanation" of the huge anticipatory importations of wool. He admitted that a year's supply was now in hand, but, when Senator Jones moved to put the duties in effect only after a year, said that it was "in the main held by speculators," not manufacturers, and that the latter ought not to be punished for the action of speculators. But will not the speculators do the punishing of the manufacturers, if what Mr. Platt says is true? They have the wool; the new duties are designed to increase its price 6 to 10 cents a pound; and they will at once exact this of the manufacturers, whereas, a suspension of the duties for twelve months would punish the speculators, and give the manufacturers a chance to get the wool on their own terms. But the real reason why Senator Platt shrinks from punishing the speculators lest he punish the manufacturers is, of course, that they are one and the same. They are manufacturers so far as relates to "compensatory" duties on the wool that is going to cost them so much, and are speculators in respect to the wool which they have imported free. Senator Platt knows this as well as anybody, and his explanation is only a ludicrous attempt to deceive.

Senator Aldrich is taking no part in the Senate debates. This is not to be wondered at, quite apart from his poor health. His treatment by the Senate has been enough to make him ill, as he has been overruled and repudiated in almost every part of the tariff bill which he got up. His revenue duties have been contemptuously dismissed. His sugar schedule was disowned and thrown away. But most significant of all has been the way in which his attempts to make the tariff reasonable and "conservative" have come to grief. Almost all his low rates have been put back to the Dingley level, or higher. The finance committee have, in fact, made an almost complete surrender. What they are ordered to do they do without a murmur. Their first talk about a conservative tariff, such as the country had been led to expect, was utterly disgusting to the men who had paid for a 700 per cent. tariff and were bound to have it. The first feeble protests against an extreme tariff are now no more heard, and the Senate goes on meekly writing into the bill what the manufacturers have first written on their own letter-heads. Revenue and moderation are thrown to the winds; and the dizziest tariff rates ever heard of in this country are voted without explanation or defence.

It is perplexing to see that the *Tribune* condemns the statute lately passed in Pennsylvania taxing alien laborers three cents a day. It says that no doubt the native laborer has felt seriously the competition of Huns, Poles, and Italians, but that it is better for individuals to suffer than that the State should adopt a policy which violates at once economic laws and ordinary justice. The *Tribune* should explain to its readers why this doctrine does not hold good in the case of a protective tariff. That violates economic laws and ordinary justice in precisely the same way as a tax on wages. The McKinley tariff on pearl buttons ruined the industry of making them in Austria, so that the wages of the poor people employed were reduced much more than three cents a day. Some of them were doubtless Huns and Poles, and the circumstance that they are on one side of the Atlantic rather than the other does not seem to be relevant to the question of humanity or justice. If it is desired to prevent foreign laborers from competing with Americans, no more effective plan can be adopted than that of taxing their wages, and the only complaint that a protectionist can consistently make of the Pennsylvania statute is that the tax is not high enough.

Republican newspapers in Pennsylvania agree that the present Legislature of that State is the worst that has ever been known. The Philadelphia *Press* characterizes the majority as "reckless and servile," and speaks of one measure which it has passed as "without justification or decent excuse, and the most brazen and audacious scheme of arrogant usurpation which even these days of jobbery, peculation, and profligacy have developed." The *Ledger* declares that "Pennsylvania has never had quite such a bad Legislature as that which is now in session." Corruption seems to pervade everything, and petty thievery accompanies highway robbery. For example, appropriation bills have been presented containing items of charges for railroad fares, cab hire, and similar expenses for members of investigating committees who declare, in the rare cases of a few honest men, that such expenses were never incurred, and that these are attempts at pure "steals." In the case of the visit of a legislative committee to New York city at the dedication of the Grant monument the cost was put down at a sum two or three times as great as could possibly have been expended. Naturally enough, fraud is employed to get such jobs through the Legislature, and four of the bills making appropriations for the expenses of legislative committees were found to have been fraudulently put upon the calendar. It is estimated that an exposure of the corrupt practices attempted will save the State $100,000.

The latest revelation about the Pennsylvania Legislature is the exposure of wholesale padding of the pay-rolls in both the Senate and the House. An honest Representative observed that the roll for the lower branch called for $75,404, while a computation of the proper total, counting every man who can draw pay under authority of the law, amounted to only $55,980. The inquisitive member prosecuted further investigations, and found acting as doorkeeper a man whose name did not appear on the employees' list. Asked how he got there, the man said that Senator Quay had sent him down with orders that he was to be taken care of. The pay-roll of the House had been padded by putting on political bummers from all parts of the State. A similar investigation as to the Senate pay-roll showed that $54,948 was asked for employees of that branch, when $39,480 was the extreme limit which could be reached honestly. The Representative who had made these discoveries offered a motion on Monday evening that the House go into committee of the whole for the purpose of correcting the rolls, but it was, of course, voted down, 109 to 66. These swindlers are merely the creatures of Senator Quay. They see that their creator never conceals his contempt for the people. Why should they affect to care anything for public sentiment?

The fact that a decision made unanimously by the Appellate Division should be reversed by a unanimous Court of Appeals in the State of New York is rather startling. This has just occurred in the case of a trust to pay the interest of a certain fund to the creator of the trust during life, the principal at her death to go to certain remaindermen in fee. It has been generally supposed that the inheritance or transfer tax applied only to property administered through the Surrogate's court, and the tax has been justified as a compensation for the supposed services of the State in allowing legatees and next of kin to take the property of decedents. In such a case as the one just decided it has been thought that the gift made was *inter vivos*, and that the interests of the remaindermen were vested, the death of the creator of the trust serving merely to fix the period of possession. It now seems that it makes no difference whether property passes through the Surrogate's court or not, and that the transfer tax will be applied whenever a donor refers in any instrument to the time of his death as determining the beginning of any estate. It is difficult to believe that the line of decision taken by the Court of Appeals concerning this tax will not soon convince people of moderate as well as large wealth that their estates will be more justly administered under other jurisdictions than that of New York.

If ever there was a simple object lesson on the best method of building up trade, it is to be found in the record of our commercial dealings with Argentina under the Wilson tariff. With imports rising from $5,343,798 in 1892 to $9,313,385 in 1896, our exports to that country have increased from $2,643,325 to $5,491,216 in the same period. It has been in our manufactures—cotton cloth, cordage, machinery, and wood products—that the heaviest increase has occurred. Taking Argentina's exports has opened its markets to our manufactures. The maker finds a taker, as Mr. McKinley would say, but only because the maker invites the taker to exchange. Europe should have proved this axiom—for in commerce our legislators must learn even axioms—and the greater hold of England, Belgium, and France on the exports from Argentina is due only to the free access accorded to those exports in their respective markets.

A market that is expanding like that of Argentina, where there are commodities to be given for commodities, is one to be cultivated. Yet the pending tariff measures deliberately affront the Argentine exporter. A duty on cattle hides will more nearly touch the exports of Argentina than those of any other country. The duties on raw wools will more directly affect the export of Argentine wools than those of any other country. For these wools are low-priced wools, being worth a little more than 14 cents a pound, against 18 cents for the similar wools of Australia. A duty of 10 cents a pound will fall more heavily on a lower-priced wool, and the import will shrink to its former proportions. No reciprocity favors can be granted to lighten the effect of this direct discrimination against Argentine exports, for the sole object of the duties is to cut off trade. The Western Senators who are loudest in demanding high and prohibitive duties on wools come from communities where there has been an actual increase in the sheep flocks since 1893; for there has been such increase in Montana, Oregon, Wyoming, Colorado, and Idaho. Their object is to monopolize the home market, and it is not likely that they or the slaughter-houses of Chicago will permit any concession to Argentine wool or hides.

We are, perhaps, inclined in this country to look on the Dominion of Canada as somewhat of a laggard in material progress, at least according to our own standards. The Queen's Jubilee, however, has caused the *Canadian Magazine* to present some statistics of its growth in trade and population which are sufficiently impressive. Sixty years ago the total foreign trade of all the colonies now constituting the Dominion of Canada amounted to about $29,000,000. In 1895 the value of this trade was returned as $224,420,000, an increase of about 671 per cent. There have been no very sudden advances, but a gradual, steady growth that indicates the existence of sound conditions. In 1850 there were scarce 50 miles of railroad in the country; in 1860 there were but 1,880; but in 1895 there were about 16,000. Population has increased from 1,100,000 in 1831 to about 5,000,000 at the present time. If the policy of the Government has been frequently short-sighted and extravagant, it must be remembered that a sound system of banking and currency confers advantages on a country that offset many abuses. Now that some of the hindrances to commerce are in a way to be removed, we may be prepared to behold advances in Canadian prosperity that will cause our own people to insist on similar reforms.

Mr. Laurier was not the only colonial Premier at the Jubilee who spoke out for free trade and against Mr. Chamberlain's Zollverein. The Prime Minister of New South Wales, Mr. G. H. Reid, was equally outspoken and emphatic. "The moment you are thrown into schemes of what is called protection," he said, "you admit that the battle is going against you, and you are practically beaten." The way to meet competition is by superior competition. That had been the maxim of British industrial development up to the present time; and "the new method of meeting competition by strategy and by barricades seems practically an admission that the time has come for the decadence of Great Britain." With two such vigorous advocates of freedom of trade as Messrs. Reid and Laurier in his colonial conferences, Mr. Chamberlain will have hard work to smuggle through a scheme of protectionism under the disguise of "fair trade," "preferential trade," "imperial trade," or Zollverein.

The Spanish Government took advantage of the recent abstention of the Opposition to secure the speedy passage of its budget. So far as legal authority to raise revenue is concerned, therefore, no difficulty will be encountered for a twelvemonth. But the particulars of the budget show the financial straits to which Spain has been reduced. The expenditure for the coming year is estimated at $175,000,000, whereas that for the closing year was but about $152,000,000. The ordinary expenditure increases over $3,000,000; the charge for the debt nearly $19,000,000. The revenue for the next year is estimated to exceed the expenditure, but this result is attained only by assuming that certain measures will bring in something like $18,000,000. These measures confer power on the Government to increase all taxes except those on land by 10 per cent.; to create a monopoly of the manufacture, import, and sale of petroleum, and another monopoly of explosives, and to issue Treasury bonds to meet deficiencies. Even before the revolt the Cuban budget showed an annual deficiency of $4,000,000, and the debt has increased by $200,000,000, while the revenue has, of course, greatly fallen off. The Finance Minister states that the charges of the military operations in Cuba and the Philippine Islands will be borne by those colonies, a proposition which contains a deplorable amount of both truth and falsehood. The Cuban people are no doubt paying the cost of war in the destruction of their wealth, but whether they can be made to pay the debt incurred for carrying on the war is very doubtful. It seems even doubtful if Spain can remain solvent for another year, for most of her sources of revenue are already pledged as collateral security for loans. The new monopolies will produce little revenue, and will only increase the burdens of the common people. Nevertheless it is a little surprising that some of our Senators do not urge us to adopt the fiscal expedients of Spain. The fabulous profits of the Standard Oil Company should be sufficient to pay nearly all our pensions if the petroleum business were monopolized by Government.

PARTY DEMORALIZATION.

Nominations were made and platforms were adopted for the November elections in Ohio and Iowa on Wednesday of last week. Both States are generally Republican, and yet each is so doubtful that the Democrats have repeatedly carried it during the last twenty years. As it was the Republicans who opened the campaign in Ohio and the opposition in Iowa, the country is given simultaneously an insight into the condition of each party in that Middle West section which decided the last Presidential election.

As Ohio is McKinley's own State, and the convention was absolutely controlled by his next friend Hanna, that body's action represents Republicanism as it is understood by the Administration today. McKinley owed his election to the support of independent voters, in Ohio and other States, who regarded him as representing the cause of sound money. The platform adopted in Toledo contained no plank on the financial question—not a word to indicate that currency reform is regarded as necessary, or even desirable. The burning issue of our politics was entirely ignored in the platform, and also in the speeches of Senator Hanna and Gov. Bushnell, who were renominated for their present positions. Congressman Grosvenor, the presiding officer, was the only speaker who alluded to the subject, and he added insult to injury by treating the appointment of the bimetallic commission now roving through Europe as the complete redemption of the party's pledges regarding the currency.

What the platform and its framer, Senator Hanna, said on other questions was as significant and depressing as the silence on the chief issue. The resolution on the tariff is confined to an absurd "demand for the wool-growers of Ohio of such ample protection for wool as shall speedily increase American flocks sufficiently to supply all American needs." This declaration was fitly complemented by Mr. Hanna's preposterous characterization of the measure over which his Republican colleagues in the Senate chamber are daily wrangling, as "the most nicely balanced, the most scientific, and the best tariff law the country has ever had." For the rest, the platform offers "sympathy" to Cuba, endorses the annexation of Hawaii, commends reforms in the Pension Bureau, bids for the "labor vote" with a call for a national board of arbitration, and gives the Mugwumps, whom Mr. Grosvenor took pains to denounce, a "dose" by denouncing President Cleveland for extending the operation of the civil-service law, and demanding the revocation or modification of his action.

The guiding spirit of the convention was Senator Hanna, who left Cleveland for Toledo "with a retinue that any monarch might envy," in a special train "ablaze with color" and bearing 400 admirers, every one of whom "wore a beautiful badge in red and gold, in which was woven Hanna's picture." He was unanimously endorsed to succeed himself in the Senate, was thanked in the platform for unspecified "splendid efforts during the present session of Congress," was given entire charge of the campaign—in short, was practically crowned as the party king in his State.

Such is Republicanism in Ohio. Quite as gloomy is the condition of what was once the Democratic party in Iowa. That organization has now sunk its identity in a fusion with the Populists and the Silver Republicans, the three parties holding conventions at Des Moines on the same day and dividing the places on the ticket among them. A eulogy of Bryan is credited with having secured the gubernatorial nomination for the chairman of the so-called Democratic State convention, and the platform acepted by all three organizations endorsed the whole Bryan platform of 1896, with a special reiteration of the principle of free coinage at 16 to 1. As the ballot law of Iowa forbids the publication of a fusion ticket on the official ballot in more than one place, the list of candidates put forth is called "Democratic," but the name is all that is left of traditional Democracy in Iowa.

The developments in Ohio and Iowa are equally illuminating. They show that the demoralization of both the old parties is complete. Republicanism in Ohio never touched a lower level than was reached at Toledo in the abuse of the Independents to whom the party owes its possession of the Presidency, the praise of tariff spoliation as a display of science, the ignoring of the chief issue in our politics, and the elevation to supreme power in the party of a man who personifies the materialistic tendencies of our civilization. Democracy in Iowa can go no further in surrender of all the principles which it once represented than when it accepts Populism as its creed and puts a Populist on its ticket as a modern "Democrat."

Yet the very badness of the situation in both of the old parties has its hopeful aspect. It demonstrates to the nation that steps must be taken by those voters who believe in something, to have an organization by 1900 for which they can vote with the enthusiasm that characterized Republican support of Lincoln and Democratic support of Cleveland when either party was at its best. The demoralization of the old parties must compel a union of forces along new lines for a campaign which will inspire support based on neither purchase nor trade. The right-minded voters of the United States will not permanently be restricted to a choice between Republicanism as it is typified in Hanna, and Democracy as it is degraded to a mere "combine" for the capture of offices.

PROTECTION UNVEILED.

The falling out of rogues is the proverbial time for honest men to get their due; and the great protectionist falling out in the Senate on June 22 was no exception to the rule. The angry recriminations which flew back and forth across the chamber let in a stronger light upon the true nature of a protective tariff than the country has ever had before. This whole extra session, in fact, called for the express purpose of making protection more sacred than ever, has brought it, even in the eyes of its whilom friends, into deeper discredit than ever. There was, first, the appalling blunder of proposing a tax on books and art; this struck the scales from many eyes which had never before seen how inherently barbarian by nature the protective theory is. Then came the startling confession by Mr. Aldrich that protective taxes could no longer be counted upon to keep the Government in funds. Afterwards came the depressing revelation that the Sugar Trust was again dictating the sugar schedule. But last week's stroke was more deadly than any that had gone before.

It destroyed the last lingering illusion about the manner in which a protective tariff is framed. We all know what was the idyllic, pre-Adamite theory of the way the thing was done. Sage and disinterested men met in Washington, looked the country over, grasped by supernatural instinct the conditions and needs of every industry in the land, apportioned to each just the amount of protection required, sternly sending to the right-about every clamorous jobber and selfish interest, and made a tariff beautifully adapted to the good of each and all. This view of the procedure long since became grotesque to those who knew what the fact was; but many people with a talent for hugging delusions still thought something of the kind to be the truth. After the late affray in the Senate, however, the most credulous can no longer be bamboozled.

Instead of a company of statesmen, looking before and after and anxiously consulting the good of the whole country, the Republican Senators revealed themselves as little better than a band of brigands wrangling over the division of their booty. Charges of bad faith were freely flung about. All the talk was of two-o'clock-in-the-morning conferences, and secret agreements and "combines," and violated understandings and ultimata served, and threats of "you will hear from me again." It was openly charged, and not denied, that one amendment offered by the finance committee was actually written on a manufacturer's letter-head. Of course, manufacturers have written their own rates before, and publicly boasted of it, but

the Senate has, till the present, always had the decency to copy them off on official paper. Even that thin disguise it is no longer thought necessary to preserve. What the manufacturers thrust into the hands of Senators is now brazenly made law just as it stands. All this, we say, with the cynical Foraker's statement of the way the wool schedule was crammed down the throats of the finance committee, strips away the last rag of concealment from protection. As Senator Vest said, he and the whole country had the privilege, for the first time, of seeing a Republican caucus at work on the tariff. When Sir George Trevelyan was Chief Secretary for Ireland, he once refused permission for a Nationalist meeting at the same hour and in the same city with a Unionist meeting, previously arranged for. He told the Irishmen to hold their meeting later and confute the Unionists. "But how can we confute them," persisted the delegation, "unless we are there at the same time?" Well, the country was there at the same time with the Republican caucus, and will hereafter have no difficulty in confuting any man who pretends that a protective tariff is aught but an unblushing dividing of the spoil.

But we must look behind the furious Senators. Their rage at being tricked, their midnight bargaining, their fierce taking the committee by the throat, their open giving of the lie, are not mere personal acts of theirs. They do but move as they are made to move, and the question is, Who is thus able to control them? Who is it that holds their political future in the hollow of his hand—who that demands the stipulated pound of flesh—who that makes them mere puppets? The answer leads to the real unveiling of protection which the country is witnessing. The Senators are not free men. The Republican party has to make, not the kind of tariff it would like, but the kind of tariff that it has sold itself to make. The manufacturers who write their own rates on their own letterheads show the true state of the case. The Senate is their creature; the Republican caucus their servant. A protective tariff is a pure matter of bargain and sale; and the terms of it are openly referred to in the Senate, where the men who are held up to execration are not at all the men who have sold themselves, but the men who show some slight squeamishness about delivering the goods.

A sardonic feature of the whole business is that all this degradation is in vain; the Republicans, like the Georgia negro who thought he was listening to the preaching of Whitefield, have been "rolling in the dirt for nothing." Even their wool schedule, over which their shameful wrangle took place, is going to have no effect on business and their party fortunes except a bad effect. With a year's supply of free wool on hand, the farmer will get no appreciable advantage from the advanced rates. With a year's supply of manufactured woollens on hand, the mills are going to be no better off. Whatever changes or improvements come will be caused by the laws of trade, not by the futile meddling with them now going on at Washington. Thousands of Republicans now admit all this. They see and say that the country has outgrown protection; that tariff rates, no matter how high or how low, are a dead letter so far as the business of this country is concerned, except that they hurt it by irritating foreigners and inducing them to retaliate. In this respect, too, the discussions on the tariff and the progress of events have revealed to many eyes, hitherto blinded, the breaking down of the protective system. Perhaps it was best that it should expire in the house of its friends. Creeds have been said to die by the process of explaining them, and protection may by the process of defending it. It might not be dropped simply because it was a proved resultant of greed and the fierce scramble of private interests; but if it is going to turn out, as it is, a disappointment to the greedy and ashes in the mouth of the selfish, the protective tariff now enacting, with all the marks of purchase and corrupt intrigue upon it, may well be the last we shall ever see.

THE HOME MARKET OF HAWAII.

So much has been said of the commerce of the Hawaiian Islands, and of its importance both as a feeder and rival to the productions of the United States, that the sense of proportion has become dim, and both advocates and opponents of the reciprocity treaty seek to support their respective sides by exaggerated statements. Only by referring to the official returns can a true idea of the commercial relations between the two countries be formed.

It may be stated at the outset that without the reciprocity treaty the consumption of American products in Hawaii would have been less than the consumption of a few counties in any populous State in the Union. By conceding a free market to some products for the growth of which the soil and climate of the islands were admirably fitted, a more potent encouragement has been given than any system of protective duties could have afforded. The treaty placed the sugar of the islands on precisely the same dutiable basis as the sugars of Louisiana, and the rice of Hawaii on the same basis as the rice of South Carolina—with some advantages to boot. The distance of California and the extreme Western States from the Atlantic seaboard and even from the Mississippi valley, and the cost of transport across the continent, gave to the sugars and rice of Hawaii a natural monopoly of the Western market.

The result has been to stimulate the growth of these products in the islands to such an extent as to concentrate in them the export trade. In 1850 only a few hides and skins, less than $9,000 in value, were imported from the then Sandwich Islands, and the total trade, both import and export, was summed up in that article. In 1860 the United States were exporting to the islands more than importing, and this relation was not altered till 1866. In the latter year the production had already centred in sugar, rice, and coffee, and, as a rather curious result of the cotton famine, a small quantity of cotton. Sugar already contributed more than two-fifths of the total value of exports. Ten years later this centralization was favored by the reciprocity treaty, and since that time the commerce has been almost uniformly based upon sugar. The export of coffee almost ceased after 1882, but has again risen to its former figures, 180,000 pounds a year; the trade in hides and skins has steadily declined since 1887; the movement of rice is variable, but shows a marked tendency to fall away, and the only class of products outside of sugar that gives evidence of vitality is that of fruits and nuts. The export of sugar to the United States in 1879 was 41,696,674 pounds, and has increased to its highest figure of 352,175,269 pounds in 1896. Of the total exports to the United States in 1896, valued at $11,757,704, sugar represented $11,336,796—or more than 96 per cent. of the whole.

Monopolizing in a great degree, as we do, the export trade of the islands, the import trade is shared with other countries. The reciprocity treaty enumerated a long list of manufactured products to which free entry was to be accorded in Hawaiian ports against the similar products coming from any other country. This discrimination has enabled the manufacturers of the United States to enjoy the larger part of the Hawaiian import trade, but no great results have followed. The highest export in any year was made in 1891, when nearly $5,000,000 was attained. Since 1877 the exports have nearly doubled in value, but the annual average is still less than $4,000,000. Nor does an examination of the details of these exports lead to any conclusion in favor of this form of reciprocity; for the articles are such as the United States possesses so great an advantage in growing or manufacturing that they would, when supported by geographical position, be exported whether there was any treaty or not—iron and steel manufactures, of which a large part was sugar machinery, breadstuffs and provisions, tobacco, and manufactures of leather, cotton, and wood—in nearly

every instance articles which could not be supplied by any other country so cheaply and easily as by the United States. The treaty stipulated only for exports on the lines of least resistance, and it would not be far out of the way to assert that the export trade to Hawaii rather reflects the growth of the import trade from the islands than any stimulus afforded by the treaty. In other words, free trade in imports has led to an export trade, and this will be the effect wherever the trial is made.

The imports into Hawaii from countries other than the United States were in 1896 $1,700,354, of which the United Kingdom enjoys the larger part. While more than 99 per cent. of Hawaiian exports are sent to the United States, only 70 per cent. of the imports are derived from us. China and Japan combined send $570,000 to the islands, while Germany is able to send less than one-fifth the value derived from England. The shipping is American to the largest degree, and all English trade is carried in British bottoms. Germany is the only carrier for merchandise other than her own.

The character of the population of the islands is such as cannot lead to any notable increase in the market for our products. What is now supplied by other peoples will largely be obtained from us, but even if the entire Hawaiian demand be satisfied by our domestic products, the increase in volume of export trade will amount to only $2,000,000, or less than one-fifth of one per cent. on the total export movement of the United States. This is a pitiably small matter, and becomes insignificant in the face of little prospect of any increase in the immediate future. The Hawaiian exports now come to us; we enjoy as large a share in the Hawaiian markets as we deserve. The movement to annex cannot be in favor of commerce, and this emphasizes the local selfishness that has dictated the annexation against the warnings of experience and in disregard of political problems that threaten danger in every aspect.

CANADA'S RETALIATORY LABOR LAW.

Three months ago Prof. Dicey wrote an article in one of the English reviews advocating what he described as a common citizenship for all Englishmen and Americans. His idea was that an act of Parliament should be passed to make every citizen of the United States a British subject, and that simultaneously an act of Congress should be passed making every British subject a citizen of the United States. It is doubtful if Prof. Dicey would have been so enamoured of this Utopian proposal if he had known more of the United States, if he had been aware of the friction which has existed on the Ontario border for ten years, arising out of the American alien contract-labor law; and if he had been aware also that, at the time his article appeared in the *Contemporary Review*, there was pending in the Dominion Parliament a measure in retaliation for the American law. The alien contract-labor law which is about to come into operation in Canada is essentially un-British in its character. It was passed by the Dominion Parliament only because of the pressure brought to bear on the Laurier Government by the members from Ontario in the House of Commons at Ottawa.

The Canadian act is almost a duplicate of the American contract-labor law, and it is believed to be the first measure of the kind emanating from any Legislature in the British Empire. It makes it unlawful for any person to assist or encourage the importation or migration of alien laborers from the United States into Canada to work under contract in the Dominion, and provides for the deportation of such laborers. It applies only to people arriving in Canada from the United States. A Liberal member from one of the border counties of Ontario was sponsor for the bill in the House of Commons; and in drawing it up he took the American law as his model, altering the phraseology so as to make it apply to the case of Canada, and to apply only against contract laborers from the United States. There is an impression in this country that the Canadian bill owes its origin to the Lodge-Corliss immigration bill passed in the last Congress and vetoed by Mr. Cleveland. This is not so. The Canadian measure was conceived two years ago; and in the autumn session of the Parliament elected in June, 1896, months before the Lodge-Corliss bill took final shape, the promoters of the Canadian bill had received an assurance from Mr. Laurier that, in the session of 1897, a law in retaliation for the American acts of 1885 and 1887 should be passed. That the Lodge-Corliss bill was known to be pending may have made the people of Ontario more urgent in the pressure they brought to bear on the Ottawa Government last year; but the Canadian law is entirely due to the American acts and to the wantonly aggressive way in which they have been long administered in the neighborhoods of Buffalo and Detroit.

Some of the proceedings of the federal labor-law inspectors in New York and Michigan suggest that the Secretaries of the Treasury at Washington, in whose department the administration of these laws comes, cannot have been cognizant of the way in which they were being interpreted. The first movement of retaliation in Canada was made during the time of the Bowell administration, and resulted in an inquiry by a parliamentary committee. The inquiry established the fact that the people of Ontario had a real grievance, and it brought out the further remarkable fact that the friction in connection with the administration of the American labor laws had always been confined to the Ontario border. Thousands of Canadians pass every year into the New England States to seek work; but from Quebec and the Maritime Provinces there were no complaints to the Ottawa committee of treatment like that which Canadians seeking work in the United States had suffered at the hands of inspectors at Detroit and Buffalo. This unequal administration of the American laws accounts for the fact that the new Canadian law is not to operate at once over the whole length of the Canadian border. It is to be put into force where it may be deemed necessary, at the instance of the Dominion Attorney-General; and while it may add to the long-standing friction on the Ontario border, it is not likely to affect the status quo in Quebec and the Maritime Provinces.

Mr. Laurier has about as much sympathy with the new law as the late John Bright would have had. He at first tried to get out of the difficulty by suggesting that if one's neighbor behaved as a boor, it was not necessary to imitate his example. But this argument was of no avail with the Ontario members. There were demands for a retaliatory bill from both sides of the House of Commons. The leader of the Opposition, Sir Charles Tupper, supported these demands; and when the Parliament opened in March last, the Premier was so placed that he had no option but to accept a private member's bill brought forward on his own side of the House. Even then he was careful not to make it a Government measure, although he was pledged to use the forces of the Government, if necessary, to help the bill through its various stages. The slightest conciliatory movement from Washington made any time these last three months would have served Mr. Laurier as an excuse for postponing any action on the bill. Even yet it practically rests with the Treasury at Washington whether the Canadian bill shall go into effect.

LYNCH LAW.

Few things cause more pain to those who are concerned for the good name of their country than the evidence of the failure of our criminal law furnished by the prevalence of "lynching." Scarcely a day, certainly not a week, passes without a report of the taking of human life by a body of citizens whose systematic measures forbid us to call them a mob. Most of these occurrences take place in communities of comparatively imperfect civilization, but from time to time they are reported from States like Ohio or Maryland, concern-

ing which no such charge or excuse can be made. That the existence of such practices is a national disgrace no one denies; but it appears to us to reflect peculiar discredit upon the legal profession. The lawyers dominate most of our Legislatures, and the shaping of our jurisprudence is practically in their hands. They may assert that their responsibility is confined to making the laws, and that it is for the people to enforce them. Such a claim is more specious than substantial, if the view we take of the matter is correct.

For whatever may be the requirements of the theory of ethics, criminal jurisprudence is a practical affair. No matter what the views of philosophers, or philanthropists, or legislators may be, society requires to be provided with laws that will work. If the public opinion of a community fiercely condemns certain acts, the law must make those acts crimes and provide for them such punishment as is regarded as fitting by public opinion. Great emphasis is now laid, and very justly laid, on the importance of making punishment reformatory. But it is equally important that to the people at large the punishment should seem adequate, appropriate, and inevitable. Unless this condition is complied with, the law will fail to secure that moral support without which it becomes the mere despotic exercise of governmental power. It may be applied with much system and formality, but it will fail of its purpose when it ceases to be the expression of the moral sense of the people.

That our criminal law or its application is defective in some of these particulars does not admit of question, and it is equally evident that reform can be accomplished only through the legal profession. Unfortunately no signs appear that the profession is disposed to exert itself in the matter. There are associations of the bar in most of the States, if not in all. There is an association of the bar of the United States. These bodies consider many important questions—too many, perhaps, for practical results—but they can consider no question more important that that of restoring popular respect for the administration of criminal justice. The public interest requires that our lawyers should concentrate their minds on the inquiry whether suitable punishments are now provided for such crimes as occasion most of the summary popular executions; whether there is a reasonable certainty that the law will seize and confine criminals in general; whether the law enables those undoubtedly guilty to escape without punishment, or with inadequate punishment; whether there are unreasonable delays in bringing on trials, in appeals from convictions, and in the infliction of penalties; whether the pardoning power is not abused or is not itself an abuse.

Up to this century the English people may be said to have regarded those of its members who were criminally prosecuted as in danger of becoming the victims of despotic power. The fact that prisoners were allowed no counsel is enough of itself to explain that multiplication of technicalities which has enabled so many scoundrels to escape their just dues. We need to consider whether the changed relations of the people to the Government have been accompanied with proper modifications of the common-law procedure. The criminal law of England is no less severe than our own; but capital crimes and executions are far less frequent than with us. Yet in England there have been no criminal appeals. Conviction before the trial court has been final, while here there are appeals on appeals, with a final resort to a writ of habeas corpus to the Supreme Court of the United States. In the State of New Jersey the Court of Errors and Appeals may be compelled to examine all the proceedings in a capital case, including the evidence, even if no exception has been taken. It does not have the prisoner before it; it does not see the witnesses or hear them testify; but it must try the case with a view to discovering "manifest error," like a court of equity balancing affidavits.

Nothing is better established on psychological grounds than that punishment, to be efficacious as a deterrent, must be prompt. But in what State is this requirement complied with? Some Legislatures have gone so far as to provide that no one shall be hanged for a year after his conviction. In almost all of them a murderer may be sure of a year, perhaps several years, of life after his arrest. He knows, the friends and family of his victim know, the people at large know, that before that time has passed many chances of escape may present themselves. The prisoner may break jail. Material witnesses may die or disappear. Resentment may be softened by the lapse of time; sympathy for the victim who has passed out of this world gives place to sympathy for the prisoner who is struggling to save his life. The longer punishment can be postponed, the greater the possibility that it may be evaded altogether; the greater the certainty, we may say, that it will be mitigated and eventually remitted. Such delays are dangerous, for in cases of atrocious crime, particularly when violence is done to women, popular passions are always difficult to restrain, and if the penalty provided by law is uncertain or insufficient, the conservative element in the community finds itself deprived of its best argument for letting the law takes its course.

ART IN THE VICTORIAN ERA.

LONDON, June 11, 1897.

This has been in London a season of Victorian reminiscences. It was inevitable that the sixtieth anniversary of the Queen's accession should be the signal not only for Jubilee celebrations, but for a general summing up of the chief events that have given distinction to her reign. You cannot take up a paper or a magazine just now without coming upon memoirs and recollections, sketches and histories of the last sixty years. And while publishers, perhaps superfluously, groan over the dull times the Jubilee has brought with it, they could not but admit a large sale for the books that relate to the same period. We have had the personal story of the Queen, with all the familiar and domestic incidents dear to the heart of the sentimental Briton. We have had the story of her prime ministers and the great soldiers of her United Kingdom and her colonies. We have had the survey of Victorian literature and Victorian drama. And space has even been found for Victorian art, which might have been left out of the reckoning, and the public relied upon to accept the omission with equanimity.

But, really, the record of art should have proved the easiest of all to make. Here was a chance, not for statement of fact alone, but for actual display of accomplishment; where art is concerned, the walls of the exhibition gallery are always more eloquent than pages of printed description. The chance has not been overlooked. Among the innumerable other Victorian demonstrations, we are having the Victorian picture show, and, in two cases at least, it has been prepared with an apparent effort to represent seriously the entire period in question. One is at the Guildhall, the city corporation having of late busied itself with art and begun to give admirable loan exhibitions of earlier work, at a time when the Royal Academy seems to have wearied of the old masters it was once its pride to show in midwinter. The other is at Earl's Court, where the Gardens that have been, in turn, American and Italian and Indian and much else besides, have very naturally become Victorian in deference to the all-absorbing interest of the moment.

To be honest, nothing could be more disappointing than these two shows, each in its own way. The galleries at the Guildhall are small, but still, by careful selection of the pictures that best illustrate the important movements and tendencies of the last sixty years, much might have been done. It is hard to say, as it is, upon what principle the selection has been made, but the result is a collection that tells little except that there were a few painters of landscape and architecture at the beginning of the reign; a group calling themselves Pre-Raphaelites towards the middle; and, at the end, a handful of Royal Academicians of no special talent or distinction. At Earl's Court matters are worse; probably because there more pictures have been gathered together to as little purpose. Indeed, the very name Victorian, which has come to be a synonym for all that is meretricious or common, which is hopelessly associated with ugliness, has had a most disastrous effect upon the entire exhibition and its Gardens. I speak the more feelingly because in the new (the July) number of the *Century* I am rather lavish in my praise of the same scene of summer entertainment. However, last year and the year before it was nominally Indian and, therefore, according to Shandyan philosophy, not doomed to commonplace. But

the court, that was then very lovely, with its great white spaces and simple lines of light, is now as ornate and garish as the most ardent Victorian heart could desire; the illuminations, that then were so harmonious because of the simplicity of their scheme, are now all discord and clashing of many colors; while high above the Garden, triumphant tribute to the commercialism of the Victorian age, the great wheel throws out a flaming advertisement against the sky. What could be more appropriate?

It is hardly a surprise, after this, to find that the pictures in the gallery are chosen at haphazard. A faint effort seems to have been made to follow some sort of historical sequence, but with most indifferent success. Here you come upon a Turner, and there upon a few water-colors by Cotman, as a reminder of the artists who were at work when the Queen came to the throne. Here a few etchings by Mr. Whistler, a few prints by Turner's engravers, a few drawings by Charles Keene, or for Dalziel's Bible, serve as scanty proofs of the wonderful development in the art of black-and-white during the Victorian era. But the rest of the collection consists chiefly of many and awful portraits of the Queen, who, whatever her virtues, cannot count love or patronage of art among them; and of perhaps the most trivial and mediocre canvases which the modern Academician has ever hung upon the walls of Burlington House. Never elsewhere has the failure of the Academy to preserve a high standard or respect its own great traditions been more pitifully exposed.

And now, to realize the tremendous interest that might have been given to these two exhibitions, consider for a moment what the history of Victorian art has been. The very word, I know, suggests all the abomination of sham marble and horse-hair in house decoration, of the crinoline and chignon in costume, of anecdote and sentiment in painting. But these things mark a Victorian interval, not the whole Victorian period, and the revolt against them, affected as its main manifestation was thought at the time, has proved the healthiest movement in art of the second half of the century. It is true that, in 1837, the outlook was depressing enough. The days of the great portrait-painters, the direct descendants (it might be said) of Van Dyck and Rubens, were over; Sir Thomas Lawrence, the last, had died in 1830. The men who had brought landscape painting to a perfection never before dreamed of, men who, with Hogarth, were the most original painters England had yet produced, were disappearing one by one; Bonington and Crome had been already dead for a decade or more; Constable's career came to an end the very year that the Queen's began; Cotman was to follow in 1842; and Turner alone was to survive long enough to take his place for us among Victorian artists. But he was ever a man apart, no favorite with his contemporaries, no influence with the younger generation. Were I writing at greater length, I might add a few other names—Müller, Barker, David Roberts, Linnell. But the painters, in 1837, already or fast coming into evidence, fast winning popularity, were Mulready and Maclise and Wilkie and Etty and Landseer and Egg and Eastlake and Leslie. These were the heroes in the Academy and the studios, the painters approved by royalty and by that nobility which, as poor Haydon's pathetic memoirs and correspondence show, was still expected to play the munificent patron of art. Among them were a few not lacking in painter-like qualities. Etty had a good feeling for color. A suggestion of something like style gleams through the bituminous depths of an occasional canvas by Wilkie. Even Landseer, when he was content to sketch and willing to forswear sentiment, could paint for you a canvas not without merit. But there is no space here to enter into a critical study of schools and standards in the opening years of Victoria's reign. The prevailing degeneracy is realized at a glance when, in the National Gallery, you leave the rooms filled with Hogarths, Sir Joshuas, and Gainsboroughs—rooms still sacred to fine conventions—for those crowded with the little trivial anecdotes and trashy popular sentiment of the early Victorians.

As for sculpture, it is useless to speak of it, since hitherto there have been no sculptors in England, if I except Flaxman and Chantrey, and neither is to be ranked with the artists who were their successors. Some of the masters of water-color—Turner, Cotman, David Cox, Cattermole—were still at work, but this essentially British art was already stooping to the tedious detail and sentimentalities of William Hunt and his kind. Black-and-white, on the other hand, had not degenerated, chiefly because the influence of Bewick was only beginning to make itself felt, and the importance of Senefelder's invention only beginning, one might say, to be realized. The illustration of books was in the transition stage; Turner, Stanfield, David Roberts, and the others still working for the steel engraver. But Prout, Cattermole, Lane, Harding, Lewis were only now bringing the new art of lithography to a perfection unrivalled elsewhere, save in France, where the great lithographers had already published their best prints.

On the whole, however, it must be admitted that I am right in saying that the outlook was depressing. It was the all but universal lowering of standards, the vulgarizing of art, with full Academical authority, that was the most discouraging feature of the time, as we look back to it. The story of the sudden rise of Pre-Raphaelitism from the slough of commonplace seems all the more wonderful in its romance when one appreciates the full measure of this commonplaceness. I have no intention of repeating the story here—it has been repeated often enough quite recently; nor do I propose to discuss the creed of the Brotherhood. What is important in this very rapid sketch is to point out the part the Pre-Raphaelites played in the revolt against Victorian vulgarity. For theirs was a revolt as truly as the Romantic movement, some twenty years earlier, had been in France. Ruskin, the prophet, Madox Brown, the master, and Rossetti, Millais, and Holman Hunt, the brave crusaders, threw down the gauntlet no less boldly, no less uncompromisingly, than the young men of the *Cénacle* when they rallied around the red waistcoat of Gautier on that famous night at the Théâtre-Français. But reaction was in the air. The evil had gone too far not to be righted. The Pre-Raphaelites were the most conspicuous rebels simply because, by banding themselves together, they gained the strength of numbers. Mr. Watts, in his way, was proclaiming his belief in the Gospel of Individuality in preference to old outworn Academical dogma. Not so many years later, Mr. Whistler was producing the plates which were to make the England of the nineteenth century as classic ground for the etcher as the Holland of the seventeenth, and the pictures which, disdained and ridiculed then by critics and public, are now finding places in the world's national and municipal museums. Because he happened to live and work in England, Mr. Whistler, the American, has been the most distinguished figure, the strongest influence, in the art of the Victorian period. Pre-Raphaelitism, naturally, is fast dying out, but his power over the younger generation makes itself more and more felt with every day.

In other directions, too, the rebellion, the reaction found full expression. The art of sculpture for the first time in England had a great artist—Alfred Stevens—for its interpreter. House decoration was being modified, improved, almost revolutionized, thanks to the initiative taken by the Pre-Raphaelite firm of Morris, Marshall, Falkner & Co. By 1860 illustration had reached a perfection that, the chances are, will not be for many years surpassed. Whistler, again, the Pre-Raphaelites, Keene, Leighton, Walker, Pinwell, Boyd Houghton—these were a few of the men working for the wood-engraver. Altogether the second period of the Victorian era was as promising as the first had been discouraging.

The stimulus then given has had its effect in the work of the last thirty years. Some might think the conditions had changed but little. The Academy—the official representative of art—raises no higher standard in 1897 than it did in 1837. At the National Gallery to-day, as years ago when it was first exhibited at Burlington House, Mr. Frith's "Derby Day" is the picture that holds the crowd. But the change can be seen now in the work of individual men—of Fred. Walker, of Cecil Lawson, of Boyd Houghton, who died all too soon for their own fame; now in the aims and objects of new artistic organizations—the new English Art Club, the Glasgow school. There has been, I do not deny, too much talk of art, too determined an attempt to manufacture the artist. For one Ruskin, a score of cheap and ready writers, calling themselves critics, make no fair exchange. The multiplication of schools is fast sowing the seeds of new evils. Affectations flourish, increase of knowledge weighs like a burden upon the conscientious, self-conscious craftsman of the day. And for all the agitation, for all the talk, for all the study, the artist, the genius, is as rare as he ever was. But, on the whole, conditions are healthier than when the Eggs and the Landseers and the Eastlakes were accepted as masters. Then the English artist had forgotten what art means; now, at least, he understands. You can see it in his portraits, in which—though he may not always succeed—he endeavors to give you something more than a stupid likeness; in his landscapes, for, at last, he respects the teaching and example of Bonington and Constable, which long bore fruit only in the studios of Paris. For this improvement, to be sure, you need not look to the Academy, forced to open its doors to distinguished foreigners like Mr. Sargent and Mr. Abbey, forced to recognize

sculptors of the eminence of Mr. Gilbert and Mr. Ford. The Academy has never yet, until it could not help itself, extended its approbation or sympathy to the genuine movements, the vigorous pronouncements of the younger men. To its shame be it said, it has remained at a standstill, while the art of England has progressed. And since you cannot find the record of this progress within the Academy, it is the more to be regretted that the special exhibitions of Victorian art should prove no less unsuccessful. The record, rightly made, is one full of romance and interest and hope.

N. N.

A WOMAN STUDENT'S EXPERIENCE IN GERMAN UNIVERSITIES.

SCHLIERSEE, June 9, 1897.

Several years ago, just before my graduation from a small Western university, I was seized with a desire to make my doctor's degree in Germany. The advice of one of my professors, however, turned the scale in favor of at least one more year in America, and I accordingly went to a large Eastern university. Here I spent two years, made my doctor's examination, and, with a partially written dissertation whose completion required some research in the libraries of Germany, I sailed for Europe. During the past year my dissertation has been completed, so that my degree is conferred upon me this spring *in absentia*, and at the same time I have had the advantage of two semesters' study in the universities of Leipzig and Munich. For the benefit of woman students who may be meditating a similar course of study abroad, I relate some of the experiences of the past year.

From the articles which I had read from time to time in the *Nation*, as also in other periodicals, I judged that only persistent effort could secure an entrance into one of the universities less frequented by women. Knowing, however, the common report that a degree in Göttingen or Heidelberg is cheaper than in a first-rate American institution, I resolved rather to try one of the larger universities, which possessed an added charm for me in the shape of a most distinguished scholar in my own specialty. I came accordingly to Leipzig, where ladies are officially forbidden, sent my letter of introduction to the celebrated man at the head of the department in which I wished to study, and begged for an interview. A cordial note, inviting me to his office the next morning, came in reply.

I was received at the appointed time with great cordiality. After a brief conversation on neutral topics, I asked if I might hear his lectures. He answered smilingly in the affirmative. Emboldened by this, I begged permission to attend the Pro-seminar, which the German students likewise enter only by special permission. This was also granted. I had not ventured to apply for entrance to the Seminar, in which the most advanced work is done, but the professor introduced the subject himself. He said:

"I do not know whether you wish to enter the Seminar or not. You know that the manners of the students are rather informal in these meetings, and, if they chose, they could make it unpleasant for you. I will not myself take the responsibility of giving you permission to enter, but I will ask every member individually if he is willing that you should enter, and if all agree, then that is in a measure a pledge for their good behavior toward you."

I thanked him, and in a few days received word that the members were willing that I should enter. It was the first time that his Seminar had ever been visited by a lady. The manners were not those of a drawing-room, but never was there anything at which I could take offence.

But this was not all which the genial-hearted man did for me. There is a series of rooms in the university containing all reference-books for my especial subject, where the advanced students had each a seat and a drawer at the table, as well as a key for entrance. This institute, as it is called, the professor proposed without solicitation to open to me, a lady, for the first time in the history of the department. Here I studied the winter through, with all the books at my hand which I could wish, and which it would otherwise have cost me untold trouble and delay to procure. He also made it possible for me to draw books from the university and city libraries. In fact, his courtesy extended so far that he came under official displeasure. He was compelled to defend himself in the faculty meeting against the charge of undue partiality toward lady-students, and the institute was visited by a minister from the capital in order to see if it were true that ladies were studying in the institute. The minister came, fortunately, on Sunday, when I was absent. For three days I was in mortal terror of being driven out of my Eden, but then the storm passed, and I was peacefully allowed to continue. The trouble all came from an ill-advised article published in a semi-official organ. At Christmas three other ladies were also allowed to enter the institute; I remained, however, the only member of the Seminar.

All the other professors whom I heard were equally cordial, as far as I had any need to call upon them. For one course I was the only applicant, and yet the course was cheerfully given for me alone. One member of the teaching-body whom I grew to know quite well expressed himself frankly to me in regard to woman students:

"The first ones who came here were Russians," he said, "and they led such irregular lives that they have done inestimable damage to the cause of the woman student. The chief objection I have to urge against women now is that they are usually ill-prepared to do the work, and that they are irregular in attendance. No degree has ever been granted a woman here, but if one should present a good dissertation, she would undoubtedly be allowed to come up for her examination. They take dissertations which we would not accept to smaller universities and make their examination there."

I am ready to endorse everything in the above statement. Every girl who comes to the university out of mere curiosity injures the real woman student just so much. The other point which he emphasized, that they are often ill-prepared, is also true. It seems to me an advantage for every American student, man or woman, to make his doctor's examination in America. It is true that a doctor's degree from here is apt to weigh more in the eyes of the world than one from America; but from what I know of the work of students here, I judge that the requirements in a first-class American university are decidedly more stringent than here. When one knows exactly what he wants to study, and has his doctor's examination behind him, so that he is hampered by no required work in preparation for a degree, nothing can be more inspiring than the intercourse here with cultured men and the uninterrupted leisure for work in one's own field.

So much for Leipzig. At Christmas I made a flying trip to Munich to get help on some knotty points in my thesis, if possible, and here I took occasion to present a letter of introduction to one of the professors. He received me most kindly, gave me readily and largely of his time, hospitably opened his own home to me, and introduced me to every one who could possibly be of assistance to me. Before I left, he suggested that if I should care to study in Munich he would be pleased to assist me in entering. Early in the spring I wrote him begging his advice. He sent me an explicit reply, giving me all necessary directions as to how to address myself to the University, even suggesting that I use Latin script instead of German in my application, since I wrote Latin with a firmer hand! Had he not written so explicitly I confess that I should probably have made a botch of the whole matter. On my arrival I found myself the only lady student in the university, but there was nothing unpleasant in my position. The professors were evidently more afraid for me than I for myself. When I came into the room for my first lecture I was met by two students whom my principal professor had introduced to me at his own home, and found a seat reserved for me between them. At first one or the other of the professors quietly escorted me through the crowded halls after a lecture, but for the most part the students whom I met through the kindly interest of my professor formed my body-guard. Such precautions were, however, entirely unnecessary, for the German student is always courteous to an American or English girl. Through this same professor I received permission to study in the university library in the room devoted to the professors, so that I had all the advantages, as far as consulting and using books is concerned, of the professors themselves. The other professors were also as courteous as possible. In no case did I have to ask permission to take part in a Seminar, for, after a few questions as to my previous work, the permission was freely proffered to me. In two cases I gratefully accepted it.

As a significant evidence of the most distinguished courtesy with which I have been treated I offer the following: In one of the courses which I attend we are studying "King Lear," naturally, as the German method is, in an unexpurgated edition. In every case where a perilous passage was to be read I have been duly warned, and have quietly absented myself from the exercise. In Munich, as in Leipzig, no degree has ever been conferred upon a woman, but I am told that a good dissertation would undoubtedly be accepted here.

This is the plain, unvarnished tale of my experience in German universities. If it shall incite any really earnest and mature woman student, who comes not to flirt and not merely to learn the language, to visit the larger German institutions, the good wishes of the writer go with her. She will assuredly be met more than half-way by every German professor.

ANNA MAUDE BOWEN.

THE SCHOOLS OF ARCHÆOLOGY AT ATHENS.—I.

THE FRENCH SCHOOL OF ARCHÆOLOGY.*

The fiftieth anniversary of the founding of the French School of Archæology at Athens was to have been celebrated in April, 1897, with great pomp and circumstance. Arrangements had been made for the holding of an Archæological Congress to which the archæologists of the entire world were invited. The meetings of the congress were to extend over three days, during which the ways and means of promoting the interests of the science of classical archæology in the field and in the library were to be discussed by the most distinguished specialists. The invited guests and the Athenian world were to be entertained by the production of the "Oedipus Tyrannus" in the theatre of Dionysos, on the ground where it was first listened to by immortal men in those mighty days of Greece's distant past. The actors of the celebrated Théâtre Français, with Mounet-Sully in the rôle of *Oedipus*, were to be imported to Athens for the occasion, and those of us who were so fortunate as to be living in Athens this year were looking forward with eagerness to this unique festival as the soul's opportunity of a lifetime. But our hopes have been blasted, for the war troubles intervened, and the celebration of the festival has been postponed until next September, when, it is assumed, the war will be over. But who is Teiresias enough to see so far into the future through the fog and din of battle?

Perhaps few Americans have even heard of the French School at Athens, and fewer still have any conception of the great services which it has rendered to the science of archæology, to our knowledge of the history of the past, to belles-lettres and literature in general, and to the renaissance and development of Greek studies in France. And when I say France I mean the world; not that France is the world, but because the benefits arising from an epoch-making idea are never confined to the immediate country in which the idea was conceived. A great idea is never long-time endemic; it is so contagious, indeed, that in brief space the whole world is contaminated thereby for the good of mankind. The French have led the way at Athens, and other nations, awakened tardily to a sense of the far-reaching educational importance of the step, have gradually followed the guidance of France, until now we have four schools—French, German, American, and English—in successful operation at Athens. Besides this, Austria has a preliminary school at Athens—Archæological Mission it is called—and Italy, Belgium, and even Greece herself are endeavoring to follow suit.

On August 25, 1846, Sainte-Beuve wrote in the *Journal des Débats* of Salvandy's project of establishing a regular connection between the University of France and the recently born kingdom of Greece. On September 11, 1846, Louis-Philippe signed and Salvandy countersigned an order establishing at Athens "une école française de perfectionnement pour l'étude de la langue, de l'histoire et des antiquités grecques." Only graduates of the Normal School were to be admitted to membership in the School at Athens, where they were to pass at least two years. Upon their return to France the young men were allowed to give free public courses along the lines of their studies while on Greek soil. But in 1850 the School was thrown open to graduates of other schools, though in the main the students have come from the Normal School. The School was formally opened in 1847 with seven students in attendance. Daveluy, the first director, held the post for twenty years. In 1867 he was succeeded by Burnouf, who was followed by Dumont in 1874; in 1878 Foucart became the Director, to be succeeded in 1890 by Homolle, the present distinguished and efficient director.

The document creating the School at Athens gave no instructions with reference to its organization and equipment, nor was anything said about the work to be done by the members of the School. As yet it was but an embryo. The School as it exists to-day is the result of a gradual growth, and resembles but slightly the institution as planned by Salvandy, Sainte-Beuve, and their associates. They builded well, though they had in mind chiefly the pursuit of philological studies; their chief object was to make it possible for chosen young men of France to make a profound study of the Greek language in all its phases, both ancient and modern, for at that time the science of archæology was in its infancy and did not occupy the proud position which it does to-day among the peoples of two hemispheres. It does not surprise us, then, to know that at the outset a professorship of modern Greek was established and maintained for years, and in order to compel mastery and fluency in modern Greek, the students of the School gave courses in Latin and French, using modern Greek as the language of instruction. These courses in modern Greek, Latin, and French were continued for nearly thirty years, being abandoned only in the reorganization of the School in 1874.

At first neither director nor students had any adequate conception of the proper work to which to devote their energies, for since no similar institution existed anywhere, only time and experience could clear away the clouds of perplexity, reveal the School's proper field of action, and define the lines along which the institution was to achieve success and fame. Salvandy, indeed, created the School, but it was Parieu, in his capacity of minister, who gave it its first serious organization, for in 1850 he required the students to send home each year for publication a paper on some archæological, philological, or historical question, and above all he placed the School under the direction of the Academy of Inscriptions and Belles-lettres. The Academy accepted the responsibility, and appointed from its members Raoul-Rochette, Hase, Lebas, Ch. Lenormant, Guigniaut, and Guizot to reorganize the School and to determine the lines along which it was to be conducted in the future. This committee proposed a plan of studies that were to cover two years. The first year was preparatory, in that it was devoted to the study of modern Greek, of the topography of Athens, of archæology, and to the reading of the ancient geographers and historians. The study of modern Greek was strongly insisted upon; special attention was to be devoted to provincial and local dialects, to the nomenclature of things belonging to the animal, vegetable, and mineral kingdoms, to the names of objects of industry, and to names of places; the study of the Albanian language was to be pursued, occasion for such study being offered by the numerous Albanian settlements throughout the kingdom of Greece. The second year was to be devoted to special investigations in the realms of history, literature, mythology, archæology, or topography. In case the students were appointed for a third year in Greece they were required to conduct special explorations. But while the Academy thus mapped out a course of study for the students, the course was not an obligatory regulation, but was intended rather as expert advice, and the students were exempted from pursuing it in case they had already fixed upon a plan of work more in accordance with their special gifts and attainments. The greatest latitude was thus given for the development of individual genius. The committee suggested for the first labors of the School the exploration of the islands of Patmos and Eubœa, a study of the Acropolis of Athens, and one on the myth of Trophonius.

In 1850 Napoleon, Prince-President, signed a degree giving the School the organization suggested by the committee of the Academy, and requiring that appointments to membership in the School be made only after the candidates had shown themselves able to stand a special examination which, it would seem, had precious little to do with archæology. Up to this time the School had been supported from the resources of the Missions Scientifiques, but from 1851 onwards it has occupied a regular place in the budget of France. In 1852 the excavation by Beulé—one of the earliest graduates of the School—of the gateway leading to the Acropolis attracted the attention of the world, and rightly too, for, in spite of Beulé's errors, the excavations marked an epoch in the history of archæology, and gave a deserved and lasting reputation to the French School.

In 1859 the School was reorganized again, at least in so far that it was divided into three sections: that of letters, that of the sciences, and that of the fine arts. The scientific section was to devote itself to a study of the natural resources of Greece. In this reorganization the students were required to spend three months in Italy before proceeding to Greece—a regulation intended to serve as an introduction to the great world of antiquity and its treasures of art. This regulation continued in force until 1873, when the period of sojourn in Italy was changed from three months to one whole year. In 1873, also, a school of archæology, preparatory to the School at Athens, was organized in Rome; this was the forerunner of the present French School at Rome, which was established in 1875. As time went on, the committee of the Academy took note of various defects and of possible improvements in the working of the school at Athens, and in 1874 M. de Cumont, then Minister, ordered a complete reorganization, which has proved satisfactory under the test of experience, for it continues in full force to this day. As before, the School was placed under the direction of the Academy of Inscriptions and Belles-lettres, which appointed from its membership a committee empowered to report annually on the work done by the students, to note the progress made, to suggest im-

*I am indebted to the pamphlet "L'Ecole Française d'Athènes," by Adolf de Ceuleneer, Ghent, 1880, for most of the facts contained in this article.

provements, and to fix upon the work of investigation or exploration to be undertaken by members of the School. In this reorganization the director was required to make frequent reports to the Academy; so frequent, indeed, that, at the weekly meetings of the Academy, a report from either the Athenian or Roman director is read, perhaps from both. In these reports the most recent discoveries in the various fields of archæology are announced in rough outline. The director is appointed by the President of France, to whom the Academy and the Ministry of Public Instruction present each a list of names, from which choice must be made. The director's term of office is for six years, but he may be reappointed, as has just happened in the case of M. Homolle. He directs the work of the students, and, because of his local knowledge, gives them all kinds of suggestions as to the ways and means of pursuing their work in such a manner as to lose the least possible time in floundering helplessly and aimlessly.

The work done in the School is similar in method to that done in the Seminar of a German university, although in quality and value it is greatly superior to that of the German Seminar. The candidates for membership in the School must be under thirty years of age, they must be holders of diplomas of Docteur ès lettres or Agrégé de lettres, and they must stand successfully an examination set by a committee of seven appointed by the Minister of Instruction. This examination includes ancient and modern Greek, the elements of epigraphy, palæography, and archæology, and the history and geography of ancient Greece and Italy. Singularly enough, philology and Greek antiquities are excluded from this examination. On the basis of the report of the committee of seven, the Minister annually appoints six members to the School. The successful candidates are required to spend one year in Italy and two in Greece. During the entire three years they are allowed but one leave of absence, of two months, a brief period which may be spent in France or outside of Greek lands. The students receive a salary of 3,600 francs, or $720 a year; besides this, their travelling expenses are paid both ways, as well as all expenses incurred on journeys undertaken in behalf of the School in Greece, Asia Minor, or the Islands. They are lodged free of all expense in the School building, but have to pay the expenses of their own cuisine. Each student chooses the line of work for which he conceives himself best equipped, whether epigraphy, general archæology, or the dialects of modern Greek.

Until 1872 the French Government rented for the use of the School the large building which has since become well known to all travellers as the Hôtel de la Grande Bretagne. In this year began the construction of the School's own palace on ground given by the Greek Government. This building consists of two separate houses connected by the library, which not only is stocked with everything that relates to classical archæology and history, but also includes much that belongs in the domain of pure literature. This is a wise measure, and goes far to prevent too much development along the lines approved by the fiddler-crab. Strangers approved by the Director have access to the library. For a portion of the winter, fortnightly meetings are held in the library for the reading of papers by the Director and members of the School. These meetings were private until the advent of M. Homolle as Director, when they were thrown open to the public. The students must remain in Athens or its vicinity during the winter, engaged in working up for publication the results of former undertakings, or else in preparing themselves for the work of the coming summer, when expeditions of exploration in Greece and Asia Minor are made by the students in groups of two each, on the principle that two pair of eyes are better than one. These expeditions have been most fruitful of results, as the many monographs of the School and the numerous articles in the *Bulletin de Correspondance Hellénique* will show conclusively even to the layman, although, as might be expected from inexperienced travellers, some of the work done has not been well done. After completing his third year—that is, his second year in Athens—a student may be and often is intrusted with the conduct of excavations; in that case, however, he is, strictly speaking, no longer a student of the School, but a *chargé d'une mission scientifique*. This was the status of Beulé when he excavated the gateway of the Acropolis, of Homolle at the excavations of Delos, of Reinach and Pottier at Myrina. Or again, after the completion of their third year the students may be intrusted with important archæological missions, such as that of Heuzey in Thessaly, Macedonia, and Epirus, or that of Perrot in Galatia and Bithynia. All these men first gained a name and lasting fame in this way.

Sometimes, too, wealthy men empower the graduates of the School to conduct important excavations, such as those of Miletus by Rayet and Thomas, for which the Rothschilds furnished the money. In the present organization of the School the courses that were so much insisted upon during the first decade of the existence of the institution are conspicuously absent. No courses are given, notwithstanding the fact that courses, for instance, in epigraphy and archaic art in the presence of the monuments themselves might be fruitful of results. But there is danger of robbing the student of his time, and experience has proved that compulsory courses for men who have found themselves and their work are deterrent and distracting rather than advantageous. The papers read at the fortnightly meetings were published during the year 1876 (when these meetings were established by Dumont) in the *Revue Archéologique*, but already in 1877 the School found it necessary to establish its own special periodical, the *Bulletin de Correspondance Hellénique*, which has been published regularly ever since. The *Bulletin* has long been indispensable to every archæologist, and grows more important with each year.

The influence of the School upon Greek studies in France and in the world has been tremendous. Surely we might expect such a result when we know that the School has trained such men as Benoît, Bertrand, About, Lacroix, Beulé, Burnouf, Lévêque, Girard, Henriot, Mézières, Guerin, De la Coulniche, Fustel de Coulanges, Foucart, Wescher, Barbier, Heuzey, Perrot, Boutan, Bazin, Terrier, Deville, Dumont, Rayet, Pottier, Martha, Dubois, Beaudouin, Riemann, Collignon, Haussonville, Haussoullier, Homolle, Holleaux, Paris, Duchesne, Radet, Reinach, Clerc, Cousin, Diehl, Durrbach, Hauvette-Besnault, and many others of almost equal name and fame. To enumerate the multitude of scientific works by former members of the School would lead us too far a-field, but suffice it to say that the whole world rings with their deeds—deeds that would never have been accomplished but for the School at Athens. Upon their return to France all the students occupy exalted positions, whether as professors in universities and colleges, as directors of museums, or otherwise in connection with the educational system of their country.

The excavations of Grecian sites undertaken by the School have been of first-rate importance. I have already mentioned those of Beulé as epoch-making, but other excavations have been of far greater scientific importance, such as Delos, Delphi, the temple of Apollo Ptoïos near Akraephiæ, Samos, Myrina, the sanctuary of the Muses at the foot of Mt. Helicon, Miletus, Mantinea, Tegea, Troezen, Amorgos, Elatea, Lagina, Thespiæ, and other places. At present the School is still engaged in the excavation of Delphi, where the finds have been of monumental importance, and have stirred profoundly the entire civilized world.

J. R. S. Sterrett.

Correspondence.

PLAGIARISM.

To the Editor of The Nation:

Sir: Dryden wrote of Ben Jonson, the splendid plagiarist,

"But Ben made nobly his what he did mould;
What was another's lead became his gold."

A striking illustration of this has never been pointed out, so far as I know. Johnson's noble and in parts beautiful "Ode to the immortal memory and friendship of that noble pair, Sir Lucius Cary and Sir Henry Morison," is based on one of Seneca's Letters (the 93d); but the nobleness and the beauty are Jonson's own. Nowhere is his power of transmutation better manifested.

It is worth while to read the poetry and prose one after the other:

"For what is life if measured by the space,
Not by the act?
Or maskèd man, if valued by his face,
Above his fact?
Here's one out-lived his peers,
And told forth fourscore years;
He vexèd time, and busied the whole state;
Troubled both foes and friends;
But ever to no ends;
What did this stirrer but die late?
How well at twenty had he fallen or stood!
For three of his fourscore he did no good."

"Quid illum octoginta anni juvant per inertiam exacti? Non vixit iste, sed in vita moratus est; nec sero mortuus est, sed diu. Octoginta annis vixit! Interest, mortem ejus ex quo die numeres."

"Alas! but Morison fell young:
He never fell—thou fall'st, my tongue.
He stood a soldier till the last right end,
A perfect patriot and a noble friend;
But most a virtuous son,
All offices were done
By him so ample, full and round,
In weight, in measure, number, sound.
As though his age imperfect might appear,
His life was of humanity the sphere."

"At ille obiit viridis! Sed officia boni civis, boni amici, boni filii exsecutus est; in nulla parte cessavit. Licet ejus ætas imperfecta sit, vita perfecta est."

"It is not growing like a tree
In bulk doth make men better be;
Or standing long an oak, three hundred year,
To fall a log at last, dry, bald, and sere."

"Octoginta annis vixit! Imo octoginta

annis fuit! nisi forte sic vixisse eum dicis, quomodo dicuntur arbores vivere."

But now comes the "Elizabethan" touch, a conception, a loveliness of phrase, infinitely remote from any Roman thought:

"A lily of a day
Is fairer far in May,
Although it fall and die that night;
It was the plant and flower of light."

Those lines could have come only from the exquisite poet that Jonson was when he wrote, elsewhere:

"Have you seen but a bright lily grow
Before rude hands have touched it?
Have you marked but the fall of the snow
Before the soil hath smutched it?"

In the last lines of this verse of the ode Jonson recurs to the ancient note:

"In small proportions we just beauties see;
And in short measures life may perfect be."

"Quemadmodum in minore corporis habitu potest homo esse perfectus, sic et in minore temporis modo potest vita esse perfecta."

It may be observed that these *suggested* verses are by far the finest in the Ode—here, as constantly, it was "buried men's thinking" that gave vigor to Ben Jonson's mind; yet none the less Mr. Lowell was in the right when he said "that a thought's his who kindles new youth in it or so puts it as to make it more true"; adding:

"And we men through our bit of old song run,
Until one just improves on the rest,
And we call a thing his, in the long run,
Who utters it clearest and best."

G. N.

"I DON'T THINK."

To the Editor of The Nation:

Sir: A number of my students, I find, are under the impression that "I don't think," in such sentences as "I don't think so," "I don't think that is true," is not very good English. Asked what is wrong with the expression, they reply, in one unvarying formula: "If I *do* think, I mustn't say I *don't* think." I am at a loss to account for this prejudice against a harmless, necessary idiom. Possibly some of their teachers have confused the proper use with the slang use, as in "He will get there, I don't think" (sometimes abbreviated to "I d. t."), or with the ungrammatical use, as in "He isn't handsome, I don't think." Will not "F. H." kindly open his portfolio and tell us the names of the notabilities and obscurities who, since the Norman Conquest, have written "I don't think"?

"Shakespeare was of us,"

for in "Much Ado about Nothing" he made *Benedick* say, "When I said I would die a bachelor, I did not think I should live till I was married." Did *Benedick* mean that he ceased to think?

I will add that in *Notes and Queries*, Ser. vii., vol. 6, p. 131, a writer who calls himself "Hermentrude," says that the sentence, "This plant will grow, don't you think?" should be corrected to read, "Don't you think this plant will grow?"

Another prejudice, as yet unexplained, psychologically, is that directed against the expression "at all," in such sentences as "I perceived nothing at all." To any one who is interested in such matters I shall be glad to send a circular of inquiry containing the questions I want answered with reference to these expressions. F. N. Scott.

University of Michigan, June 21, 1897.

[Dr. Fitzedward Hall has already said the last word about *at all* in No. 1497 of the *Nation* (Vol. 58, p. 175).—Ed. Nation.]

BY AND LARGE.

To the Editor of The Evening Post:

Sir: Observing the discussion of *by*, in notes of "F. H." and others, I was hoping to learn the origin of *by and large*, equivalent to the commoner phrase, *on the whole*, as if viewing a matter near (*i. e.*, *by*) and at a distance (large) or widely. Living where I hear many dialects, I have heard this perhaps for forty years, but never from a man of Southern speech. Bartlett ('Dict. Americanisms') gives two examples, undated, both Northern. I first noticed it in print about 1865, in *Hearth and Home*, ii., 164. It has a Northumbrian or Scotch sound. Jamieson gives *Far-hie-an-atour*, from Aberdeenshire, as meaning at a considerable distance; this phrase one may match with an unusual expression in the *Nation*, No. 1654, p. 188, col. 3, "Prof. Powell . . . is *far and away* the principal Icelandic scholar in England." Is that Scotch? Samuel Willard.

Chicago, June 24, 1897.

[The Oxford Dictionary takes notice of both these expressions, but of the first only in its (presumably) original sense of sailing to and off the wind (1627). "Far (and) away" it regards as a mere intensive of *far;* but the only citation is late (1883).—Ed. Nation.]

GERMANS IN THE TURKISH ARMY.

To the Editor of The Nation:

Sir: I have read with much interest the letter from Paris on "The German Emperor and the Porte," in the *Nation* of June 24. It seems to me to furnish the key to the situation. In the late unfortunate war between Greece and Turkey, Germany has played no unimportant part. German officers have been sent to Constantinople to instruct the Turks in the most approved methods of modern warfare. Baron von Brockdorff (or Brockdorff Pasha, as he is now styled) is at the head of the Turkish cavalry. He is a nephew of the late Count von Moltke, and did good service in the Franco-Prussian war, having received the decoration of the Iron Cross. A few years ago he was in this country, occupying the position of Professor of Modern Languages in the Maryland Agricultural College. I was intimately associated with him for about four years, and know him to be a brave man.

Respectfully yours, Wm. D. Morgan.

Brooklyn, N. Y., June 26, 1897.

Notes.

Mr. Frederic Lawrence Knowles, himself a promising verse-writer, has compiled and edited for L. C. Page & Co., Boston, a 'Golden Treasury of American Songs and Lyrics,' to be published in the autumn. Free access has been obtained to the entire range.

Two volumes of 'Specimens of the Pre-Shaksperian Drama,' by Prof. John Matthews Manly of Brown University, are in preparation by Ginn & Co.

Townsend MacCoun, No. 126 Fifth Avenue, New York, promises in September 'The Holy Land in Geography and in History,' with 154 full-page maps and charts, in two 16mo volumes.

In the course of the present year, *Bradstreet's* will bring out a 'Cyclopædia of Fraternities,' Masonic and other, by Albert C. Stevens.

Bonnell, Silver & Co. will soon issue 'Across the Country of the Little King: A Trip through Spain,' by William Bement Lent, and 'The Sacrifice of a Throne,' being an account of the life of Amadeus, Duke of Aosta, by H. Remsen Whitehouse.

William Briggs, Toronto, has just ready 'Louisbourg in 1745,' being a letter of a French inhabitant of that stronghold written during the siege. It is edited and translated by Prof. George M. Wrong of the University of Toronto. Parkman has used the document.

As was inevitable, Gen. Horace Porter's articles in the *Century* on "Campaigning with Grant" are the forerunner of a subscription book to appear in the autumn.

The serial entitled "The Workers," "an experiment in reality" (or, more lucidly, in studying the working classes by earning one's living as one of them), by Walter A. Wyckoff, which begins in the August *Scribner's*, is designed for ultimate publication in book form as a contribution to sociology.

We understand that an American imprint is likely to be secured for G. E. Weare's 'Cabot's Discovery of America,' just published in London by John Macqueen, with numerous maps and interesting illustrations.

The Appalachian Mountain Club was well advised in selecting Mr. Edwin M. Bacon, author of the standard 'Dictionary of Boston,' to prepare 'Walks and Drives in the Country Round About Boston' (Houghton, Mifflin & Co.). This is a compact little volume, not too large for the side-pocket of a coat, with small print, yet very legible and attractive, interspersed with cuts (or, more properly, pen sketches), and equipped with four detached folding-maps of Boston and its environments on the N. E., N. W., S. E., and S. W. These maps are based on the State and United States Geologic Survey contour maps, on a scale of nearly a mile to an inch. The territory embraced by Mr. Bacon is substantially the metropolitan district, or the so-called Boston basin. His tours begin in the northeast and swing round against the hands of the watch, and stretch a point to take in Lexington and Concord, thence passing on to the shore at Quincy. Mr. Bacon's discourse is as agreeable as it is literate and knowing, and his guide-book is just the companion which the growing park system of Boston called for. There is a good index.

Lemcke & Buechner send us the second edition of the indefatigable Joseph Kürschner's 'Staats-, Hof- und Kommunal-Handbuch des Reichs und der Eingelstaaten,' with eighteen portraits of dignitaries, half of them Bürgermeister. The Handbook opens with a monthly chronicle of events of 1896, followed by a list of memorable days in 1897; and then we have the orderly exposition of the Empire, its princely rulers, the federal States, the diplomatic body, the fighting land power and sea power, judiciary, railroads, post-offices and telegraphs, public instruction, finances, trade, etc., and a statistical annual, winding up with a brief view of the principal non-German countries the world over. It is needless to say that

this compilation is a valuable supplement to all other existing manuals in the same field. In the matter of official personnel it is astonishingly full. The various sections are conspicuously divided off by red leaves. Delay has ensued from an endeavor to make the utmost possible use of the last census, which, it appears, is far from being wholly available.

Two editions of the Greater New York Charter have been published, one by Baker, Voorhis & Co. of this city, the other by the Weed-Parsons Printing Company of Albany. The latter is annotated by Mr. Mark Ash, whose work on the old Consolidation Act was, no doubt, the reason for his selection as the editor of this volume of 1,251 pages. His notes indicate the original statutes from which so much of the present charter is taken, and refer to judicial decisions, besides giving in a variety of appendices a quantity of other correlated information. Both volumes contain the colonial charters. Baker, Voorhis & Co.'s volume is annotated by Mr. C. F. Birdseye, well known as a competent workman in this field. It contains 887 pages; as the page in this volume contains a much larger number of words than that in Mr. Ash's, it is very difficult to compare the bulk of the annotations. There is no table of cases in either.

Helps to the study of Greek pottery multiply apace. Now that the catalogue of the British Museum vases is three-fourths completed, the treasures of the Louvre collection are beginning to be adequately published. Thanks to subventions from the French Ministry of Public Instruction and the Academy of Inscriptions and Belles-lettres, M. E. Pottier is able to supplement his recently published small catalogue of the ancient vases of the Louvre by a sumptuous album, of which the first part is now before us ('Vases Antiques du Louvre,' Hachette & Cie.). Two additional parts are to follow. This first instalment is devoted to the early Greek and Italian vases down to about the sixth century B. C. The work is somewhat novel in character. In the first place, it is more liberally illustrated than any other museum-catalogue of vases that we have yet seen, upwards of three hundred vases being here reproduced, most of them by the half-tone process, and all, we believe, for the first time. In the second place, the text is not a complete catalogue of the collection in the Louvre, but is limited to those specimens which have been published either in the accompanying plates or elsewhere. This is doubtless a wise restriction, at least for those who are to use the book away from Paris. It hardly needs to be said that this admirable work will be of inestimable value to the student of early Greek ceramics. We shall await with eager interest the appearance of the next part, which will deal with the most beautiful and most interesting products of the Greek potter's art.

The Fourteenth Annual Report of the United States Bureau of Ethnology (for 1892-'93) is largely devoted to Mr. James Mooney's monograph of the Ghost Dance Religion, separately bound as a royal octavo volume. The ostensible date of 1896 on the title-page is wrong, as so frequently is the case with Government publications, the work having first appeared in May or June of 1897. It is mainly devoted to the Sioux outbreak of 1890, and is particularly full on the affair of Wounded Knee of December 15, when the notorious Sitting Bull was killed. The religious excitement of that year had far-reaching consequences, involving most of the area of the United States west of the Mississippi, cost many lives, and is still fresh in the public mind; but its full significance could hardly be grasped by one unfamiliar with Mr. Mooney's exhaustive studies of the event in all its bearings. We may not care much for the songs, rituals, and ceremonies which are here detailed at great length, not only in case of the Sioux, but also of the Arapahoes, Cheyennes, Kiowas, Comanches, Caddoes, Paiutes, and other leading tribes, together with their tribal synonymy, signs, history, and other matters of ethnic interest, according to the liberally comprehensive method of the Bureau; but no one can fail to be struck with the importance of the general bearing of the subject, when Mr. Mooney draws his philosophical parallels with other systems of religious fanaticism. They are all of a part, in their main ingredients of priestcraft and superstition, with a strong spice of hypnotism. They are very real and true factors of human nature, presenting problems of the highest importance to students of rational psychology. The work is very fully and handsomely illustrated. Space is lacking to do more than mention Part I., issued about the same time, consisting mainly of Dr. W. J. Hoffman's monograph of the Menomini Indians, and of Mr. G. P. Winship's critical study of Coronado's expedition of 1540-'42, in the light of some new documentary evidence. The whole Report is, of course, indispensable to ethnologists.

"A Bibliography of the Higher Education of Women," compiled by a committee of collegiate alumnæ, is the latest publication of the Boston Public Library. It is a pamphlet of forty-two pages, including an author index, and contains a list of about fifteen hundred titles, some of which are annotated, arranged under eight different heads. These are: General and historical, higher education in relation to health, coeducation, professional and scientific education, post-graduate study, occupations and opportunities for college-bred women, colleges and universities wholly or partly open to women (with their publications on this subject), and societies for the education or advancement of women. The editor is Miss Mary H. Rollins, and most of the works are to be found in the Library.

The annual report of the same institution for 1896 shows a gratifying increase in its collections and in their use. The library contained on January 31, 1897, 663,763 volumes, of which 492,901 are in the central library, an increase of 33,468, the gifts being 9,467. The cost of the building thus far has been $2,279,373.72, and the annual appropriation by the city is $225,000, of which $25,000 only is for books. The efficient administration of the library, however, demands a much larger sum. The report of the examining committee closes with the pertinent suggestion that a change be wrought in that body so as "to make it a seriously useful help in the administration of the library." This might be accomplished by making it more permanent, a part only retiring each year, "in which case, perhaps, such a board should not be appointed by the trustees and directed to report to them."

Volume xxiv. of the Transactions of the Asiatic Society of Japan contains much rich material relating especially to the extremities of the empire. Basil Hall Chamberlain contributes a bibliography of Japanese and Chinese writings on the Luchu Islands, the Rev. John Batchelor a suggestive study of Ainu words which reveal the mind and feelings of these primitive men, and Mr. James W. Davidson reviews the history of Formosa and the life of Koxinga. Prof. E. W. Clement has an interesting paper on Chinese Refugees of the Seventeenth Century in Mito. The influence of Greco-Persian Art on Japanese Arts is discussed by the Rev. Isaac Dooman, in which he shows the great quickening of the native intellect and hand through Buddhism, the product of the Aryan mind. The Rev. Arthur Lloyd pictures life in an old native inn, and Prof. Garrett Droppers writes of Economic Theories in Old Japan. In the main, these papers show the great debt which Japan, in common with other nations of power and promise, owes to external influences. The Society is in a flourishing condition. Sir Ernest Satow is President, and Prof. E. W. Clement of Tokyo is Secretary.

Anent the higher education of young women in France, the Vicomtesse d'Adhémar writes, in a recent number of the *Revue de l'Institut Catholique* (quoted in the *Revue Internationale de l'Enseignement* for May): "Christians who do not separate instruction from education, and, consequently, from those religious principles which give to instruction its true educative value, . . . cannot avail themselves of higher, university teaching. This is a very great misfortune; for all those noble elements of progress, instead of helping us, are used against us, and the position of Christian women, in matters of higher learning, is very critical, since the State alone can at present furnish to women that higher instruction which it has established as a custom, by which we cannot profit without betraying our principles, and which we must nevertheless seek lest we show a fatal inferiority." As a counterpoise to the growing influence of State lyceums and colleges for girls, the Catholic Institute has this year opened courses of six lectures each on philosophy, political economy, physical geography, literature, recent scientific discoveries, and several other subjects, and there is some prospect that Catholic institutions for the training of female teachers of a superior class for secondary schools may be founded.

That a contributor to a conservative review should criticise the management of educational affairs in France is natural enough. But it is less easy to understand why M. Maurice Talmeyr, in his article in the *Revue des Deux Mondes* for June 1, should find it necessary to insult a whole class of his countrywomen as respectable as the French schoolmistresses as a body unquestionably are. The anecdote of a dancing girl at the Jardin de Paris, waving her *brevet supérieur* at the end of her foot while pirouetting before a gazing multitude, seems to us an unfortunate illustration of an existing evil. It is the tone of the article we deprecate, not its tenor; if the crowded condition of a career is sure to bring disappointment to thousands of candidates, it is well that a warning voice should make itself heard.

The translation and abridgment of a story by another Polish woman which has lately appeared in the *Revue des Deux Mondes* from the pen of Mme. Marguerite Poradowska, ought to have the effect of calling attention to two novels of her own which are of very unusual merit. One of them, 'Demoiselle Micia,' was crowned by the French Academy, and it is beyond doubt a masterpiece

which richly deserved that distinction. It has the apparent slightness of structure of the things of Turgeneff, but it has also a more than ordinary share of his artistic perfection. To translate it would be a good deed.

Korea has now reached that happy state in which, for a while at least, she has no history—by telegram. Private letters and periodicals from Seoul tell of quiet progress. On May 1 Mr. H. B. Hulbert, late manager of the *Korean Repository*, after ten years' experience in the country as teacher, engaged himself for five years to the Government, to establish schools, prepare textbooks in the vernacular, and in other ways forward a national system of education. The *Repository*, edited by Messrs. Jones and Appenzeller, continues its monthly issue of scholarly historical, literary, and contemporary illustrations of Korea and its people. The *Independent*, hitherto printed tri-weekly in English and Korean, edited and published by Dr. Philip Jaisohn, a native Korean, is now issued wholly in English. A glance at the file from April 7, 1896, to May 1, 1897, shows creditable editorial writing, admirable condensation of news, and a keen sense of the needs of the once Hermit Kingdom. It is to be hoped that "the freedom of the press" will not be either abused or curtailed in Cho-sen, for the good influence of this "only English newspaper in Korea" is beyond a question.

Two works reviewed in our last issue, Anderson's 'Architecture of the Renaissance in Italy' and Greene's 'Corporation Finance,' should have been credited to Charles Scribner's Sons and G. P. Putnam's Sons, respectively.

—The proposition to put a duty on white pine gives a timely interest to Dr. Robert Bell's article on the geographical distribution of forest trees in Canada in the *Scottish Geographical Magazine* for June. It embodies the results of his personal observations for the past forty years, in each of which he has been engaged in exploring one part or another of the Dominion, and is in illustration of a map showing the boundaries of some thirty of the principal trees east of the Rocky Mountains. Of the 340 species known to be indigenous to the United States—"a forest wealth which is perhaps unequalled in any other region on the globe"—123 grow in Canada. One only, the Banksian pine, belongs almost wholly to Canada, a few specimens being found on the southern shore of Lake Superior and in Minnesota. Dr. Bell's observations lead him to believe that while the verge of the forest is retreating southward, both in North America and Asia, some species, as the black walnut, appear to be advancing farther north, as if they "had not yet had sufficient time to occupy all the territory congenial to their existence." The great northern forest which stretches from the Strait of Belle Isle to Alaska, a distance of about 4,000 miles, with a breadth of some 700 miles, consists of small trees and essentially of nine species. The statement that forest fires are natural phenomena, mostly due to lightning, leads Dr. Bell to a fine description of one. A curious result of these fires, to which he does not attribute the treeless condition of the plains and prairies, is the propagation of the Banksian pine, for which fire is a necessity. Its knotty cones are not deciduous, but stick to the tree as long as it lasts; but when the fire attacks it, "the cones immediately open, and the seeds become scattered far and wide by the wind." This article is followed by an interesting account of the market fishes and marine commercial products of Australia, by W. Savile-Kent, the commissioner of fisheries, in which he describes some successful experiments in introducing English varieties and in the artificial culture of mother-of-pearl shell. He adds another to the number of Australian anomalies, the fact that the Murray cod "most commonly deposits its eggs . . . in the hollow trunks of submerged eucalyptus trees," the spawning season occurring "when the floods are out."

—M. Constantine Balmont gave on June 4 his inaugural Ilchester lecture at the Taylorian Institution in Oxford. His subject was "Modern Lyric Poetry in Russia." Speaking of himself as representing what is a common experience among Russians of the present day who care for literature, he confessed that at the age of seven he first learned from 'Uncle Tom's Cabin' that there is suffering in this world of ours. From 'Robinson Crusoe' and 'Gulliver's Travels,' read in abridged translations, came the first hold of literature upon him. Zhukovsky's translations of English ballads, Dickens's novels, and Byron's poems came later, while with Shakspere's dramas the mental growth of his youth and manhood was inextricably associated. English poetry charms the Russian mind, he declared, not with the frigid compulsion of strangeness, nor yet with the mere power of superiority. Dante, for instance, in spite of superiority, has, he declared, no Russian readers. Shelley, in describing himself as "meek and bold," described equally well the common temperament of Russians and Anglo-Saxons. They have the inflexibility of a home-keeping, home-loving conqueror, fond of peaceful dreams and amenable to the gentle splendors of the sunset. Gogol, Pushkin, and Dostoievsky, most brilliant and original among all great Russian writers, have unmistakable English affinities, but admit of no telling literary comparison with writers of any other nationality. Gogol's humor pairs him with Swift or with Dickens. Pushkin at times is Byronic, at other times, though from far, he consorts with Shakspere. Dostoievsky's affinities are with Dickens, perhaps, but certainly with Poe, the author of "The Tell-tale Heart." Zhukovsky, Pushkin, and Lermontoff created the literary language of Russian lyric poetry. Zhukovsky, a type of passivity and gentleness of soul, responded to all influences to which nature made him sensitive, with a readiness little short of the miraculous. Bürger, Uhland, and Schiller he translated, but came closest to English romanticism and interpreted Southey, Scott, and Moore for his compatriots. His translations are stamped with an originality quite his own. His poetry is bathed in a glimmering light as of the moon, where we discern phantoms and hear uncertain sounds dying away. His subjects reappear with a marked difference of treatment in the most modern Russian lyrics. Pushkin was no translator, but, like his hero, Peter the Great, a creator. In him was the quintessence of youth, the springtide, naïveté, and unessayed vigor of a new race. Everything he saw was new, and each contact with the world awoke a swarm of thoughts, feelings, and notes untried. Lermontoff had even closer English affinities than Pushkin, and no wonder, since he was of Scotch descent. He was Byron's double, not his disciple, but his brother. His world misconceived him and left him to eat out his heart alone.

—After this introduction, M. Balmont turned to the typical lyric poets of modern Russia, Tiutsheff and Fet (the dominating pseudonym of A. A. Shenshin). As men, Pushkin and Lermontoff stand out in complete contrast over against the two modern lyric poets. Tiutsheff and Fet lived every-day lives and died as patriarchs, died "old men, and full of years." Pushkin and Lermontoff, on the contrary, were alike in suffering proscription and exile. Both lived in the mountains of the Caucasus, each died prematurely in a duel; Pushkin did not reach his fortieth, Lermontoff did not reach his thirtieth year; neither of them lived to have a glimpse even of the true answer to the riddle of life. Both chose similarly special and tragical themes in song. In the works of neither lurks the mystery of things; they are romantic only in their choice of subjects, in their workmanship they are realists. They go beyond their own experience for their subjects, and reproduce nature, in detail and in the concrete, just as it strikes the eye. They are far from divining any underlying and all-embracing truth. The opposite holds of Tiutsheff and Fet, the two masters who have introduced into Russian literature what M. Balmont qualifies as psychological poetry. They give us no heroics, and their subjects mirror nothing more out of the way than the varying moods of the soul. Their poetry is intimate and mysteriously suggestive. They give us glimpses into the remoter depths of human personality, and nature in their poems does not figure as a *mise en scène*, it lives with the breath of its own being. To test this contrast, the lecturer asked, How do these poets, the old and the new, interpret the genius of poetry? How do they interpret nature? How do they express the passion of love? Finally, he contrasted two powerful poems on insomnia, the one by Pushkin, the other by Tiutsheff, and indicated the general line of the three lectures in which he will complete his survey of modern Russian poetry.

—'The Beginnings of Art' (Appletons), from the German of Prof. Ernst Grosse, forms part of the Anthropological Series, and is a contribution to ethnology rather than to art criticism or history. The author's contention is that the only scientific method of investigating the origin of art is to examine the art of the primitive peoples that still exist, and, secondarily, that the general classification of "savage" art is most misleading and unscientific; those peoples only being entitled to the name of "primitive" who are still in that stage of civilization which we must presume to be the earliest, and in which subsistence is wholly dependent upon the chase. He therefore devotes himself to an examination of what is definitely known of the arts of the Australians, the Bushmen, the Eskimo, and two or three other such tribes, taking up in their order personal decoration, ornamentation, representative art, the dance, poetry, and music. Besides disproving some of the doctrines of Taine, Spencer, and others, Prof. Grosse seems to have established certain positive conclusions. These are that all

the arts except architecture have always existed among all peoples; that the art-impulse, "which is substantially identical with the play impulse—that is, with the tendency to an extreme, purposeless, and therefore æsthetic occupation of corporeal and spiritual powers, and which is more or less combined in various forms with the propensity to imitation—is without doubt a general possession of mankind which is probably far older than human nature itself"; that the arts in their primitive state are very similar among the most diverse races; and that rhythm, harmony, proportion—some form of order, in a word—is the dominating characteristic of all of them; finally, that art is, among primitive peoples, the great binder together and social organizer as well as the great educator. The advocates of the higher doctrine of Art for Art's sake, that art should be pursued with singleness of purpose, in the confidence that good art is good for man, will here find brave weapons forged for them by science.

—Dr. J. P. Richter, known as one of the very first authorities on Italian art, deserves no less credit as a student of that fascinating but labyrinthine period of art history, the transition from antiquity to the Middle Ages. His invaluable work on the mosaics of Ravenna is well known. Now we take pleasure in drawing attention to his publication of all such documents as are of service to the history of Byzantine art ('Quellen zur Byzantinischen Kunstgeschichte.' Vienna: Carl Graeser). Every chronicle, every compilation, has been ransacked and made to yield up what information it could give regarding the progress of art at Byzantium, from its foundation by Constantine to its fall, under another Constantine. It is true that Dr. Richter's work will prove of greater value to the student of Byzantine topography than of art proper. But the architect will find ample indications, and the students of the plastic arts and of painting can feel, at least, that nearly all has been done for them that well could be. The glimpses given of court ceremonial are entertaining as well as valuable. It need scarcely be said that, throughout, Dr. Richter's annotations of the texts are helpful and illuminating.

—From the press of Honoré Champion, Paris, comes a new book by Edmond Biré, not on Victor Hugo, however, but on Honoré de Balzac. It might be supposed that this realistic writer would share the fate of the great poet and dramatist on whom Biré has published such bitter and often unjustifiable criticisms, but Balzac has found favor in his sight, and the work is a laudation slightly tempered by reserves. Balzac, it is true, did many things which in Hugo were atrocious; he assumed a nobility of birth to which he had no right whatever; he wrote plays which were not good at all, save one; he was vainglorious and boastful; he had near as little wit, of the French brand, as Hugo, but, notwithstanding all this, he is presented to us by Biré in a manner almost loving. His plays are much better than critics and public have been willing to believe; his vanity is not inordinate; his wit is of the lightest, and so on. The answer to the riddle of the difference in treatment of the two men is simply, as Biré himself ingenuously admits, that Balzac professed himself a royalist to the end of his days, and a Catholic to boot. Hugo changed with the changing years, but Balzac remained faithful to the creed that Biré holds; hence what are deep-dyed sins in the former are peccadilloes in the latter. Granted that a man may forgive to one writer what he condemns in another, it nevertheless remains true that, by his publication of this book on Balzac, Biré has justified the reproach addressed to him of having, in his volumes on Hugo, served his hatred of the great poet rather than sought, as he claimed, to vindicate truth. Biré is not a safe critic; he colors his judgment by his sympathy or his antipathy. It is noteworthy that the Balzac reads less well than the Hugo; in the latter volumes hate lent his style a lightness and vigor one looks for in vain in the praise of Balzac.

A FUR-TRADER IN THE NORTHWEST.

The Manuscript Journals of Alexander Henry, Fur-Trader of the Northwest Company, and of David Thompson, Official Geographer and Explorer of the same Company. 1799-1814. Exploration and Adventure among the Indians on the Red, Saskatchewan, Missouri, and Columbia Rivers. Edited, with copious critical commentary, by Elliott Coues, editor of 'Lewis and Clark,' of 'Pike,' etc., etc. In three volumes. New York: Francis P. Harper. 1897.

This bulky book is the Journal of a fur-trading chief on the Red River, the Saskatchewan, and the Columbia. His chronicle, which runs through a dozen of the years between 1799 and 1814, sheds new light on the region of three rivers which were the only early thoroughfares between the Great Lakes and the Pacific, and which would be so still but for the advent of railways. The chronicler, Alexander Henry, had been far northwest in 1792, but his regular journal opens with a voyage from Fort William, the north point of Lake Superior, via Lake Winnipeg, and up Red River to a point some miles south of the international boundary. This transit cost him, with his brigade of twenty-nine attachés and forty-five canoes of Indians, fifty laborious days, with about as many portages. He once passed over the same mileage in twenty-two days, and "believed it was impossible to perform the voyage in less time" (p. 260). That distance may now be made by rail, and nearly on the same route, in twenty-one hours. After the first winter he changed his base to Pembina, still on the Red River, but exactly on the line between Dakota and Manitoba. His principal post was here till 1808. From this stamping-ground his fur-laden canoes returned every year to the great lake, and he himself usually went with them for the better procuring of supplies, and for consultation with magnates stationed at Fort William by the Northwestern Fur Company, under which Henry was the Red River manager. In 1808 the control over posts on the larger river, Saskatchewan, was confided to Henry. His passage up that long-drawn longitudinal stream from the old station to the new consumed forty-two days. During his command at this utmost corner of the West, he made a forced march in mid-winter to the continental divide, where, in the Howse Pass, the head-waters of the Columbia rise within two miles of the Saskatchewan (51° 48′). Transferred to the Pacific Coast Department, he made his way overland to Astoria. When that place was captured by the British, in November, 1813, he was present, and became Governor there, but the next spring he was drowned at the mouth of the Columbia River.

Henry's writing began with business statistics—his outfits, losses and gains, workmen, portages, helps, and hindrances to his movements, contracts and enterprises. By degrees his daily jottings included hair-breadth 'scapes in tours of duty on flood and field. It moves our special wonder that he did not perish a dozen years earlier by swift illapse of accident disastrous, or in perils of waters and wilderness, of famine and nakedness, of sickness, robbers, and false brethren. Fortunes were made in the fur trade, and the secret of success was in theory simplicity itself. The golden rule was only this: Steal the hearts of Indians with tempting trinkets, and by all means with one whiskey debauch—but only one. Then give those bondmen straw that they may make brick, supply them with guns, and whatever is indispensable for hunting, to be paid for from the first skins yielded by their hunt, rouse them to do their utmost through the hunting season by promises of rum and rations at the finish—above all rum—till they shall say they have never been treated so well nor so often. Such was the practice of Henry. At the outset his freight to the Red River consisted, among other necessaries, of one package of flour and ten packages of undiluted rum—all packages being of equal weight for facilitating carriage at portages. Here was a proportion like *Falstaff's* "one-half penny-worth of bread to an intolerable deal of sack." But in truth the whole process was Shaksperian from first to last. The fur-trader was typified by *Stephano*, with his butt of sack. Henry was never far from *Calibans* who any print of goodness would not take, but who, after once tasting celestial liquor, would swear by the bottle to be his true subjects. They would kiss his foot, show him the best springs, with their long nails dig him pignuts, fish for him, and instruct him how to snare the nimble marmoset. To crown all, they were most like the perfidious *Caliban*, because, if they caught their god asleep, they would rob him of his bottle for its nectar that was not earthly.

Henry's golden rule, while as easy to learn as that in the gospel, was as hard to practise. How to make the most of it was his study by day and dream by night, and inspired every word he wrote. His success was much increased by personal qualities. He was a good swimmer and hunter, led in all dangers, equalled his toughest retainers in endurance, held his passions in hand. One of his passages was the quickest ever made from Superior to the Red River. The score of underlings articled to serve Henry on the Red River, if we may judge by their names, were all French or half-breeds, except one negro. These workingmen were accompanied by twice as many tribal Indians. After he had fixed on a site for wintering, he had little ease till, at the end of seven days, he had finished a stockade of fifteen-foot posts and a massive gate—a wall of partition between the natives carousing without, before their send-off on an all-winter hunt, and the serfs within, over whom he ruled as despotically as a

ship-captain or slave-master. In one corner, on a platform too high to scale, his tent was pitched, with views outward and inward. Here he was monarch of all he surveyed. His sceptre was a double-barrelled gun, and he was a dead shot.

In snuggeries of this sort he jotted down his impressions regarding his environment—men, beasts, scenery, and adventures. While writing them out in black and white his pleasure must have been analogous to that of a cat who lets a captured mouse almost escape her that she may taste the rapture of catching him again. New matter constantly occurred to him, and he unawares wrote volumes. As his dealings were mainly with Indians, he made a grand contribution to their ethnology. This feeling grows in us as we note his vocabularies, his accounts of Indian sign-language, game tracking, bow making, arrow-poisons and antidotes, edible barks, boats of buffalo hides, and hoes of their shoulder-blades, and (above all things else) horses and fire-arms as transforming aboriginal life. Everywhere the writing approves itself as realistic and reliable as the notorious annals of Pepys, naked and not ashamed.

In Henry's stockade there was an Indian Hall, where the hunting brigade was received, furs taken to pay old debts, and a present was made of Indian rum, 85 per cent. water, except the sample glass, in kegs never holding less than a gallon, "since one gallon in a large keg," as Henry tells us, "looks bigger to them than double that quantity in several small kegs" (p. 729)—an unexpected witness that the whole is more than all its parts. The exchange of furs for whiskey once finished, the bacchanals were straightway turned out of the fort to drink their fill and fight out their frenzy with one another. The garrison, looking down from the walls, beheld a sort of volunteer Roman gladiatorial butchery. In such scenes Henry thus moralizes: "Spirituous liquors are the baneful source of all evils"; "the subtle poison to which their wretched condition is mainly owing" (p. 711); "murders are always in drinking matches" (p. 209); "what a different set of people they would be were there not a drop in the country," etc. Yet rum was his *primum mobile* and ultimatum, with such results that his editor, usually a Stoic, exclaims: "The trade was simply hell on earth—hell peopled with no souls above a beaver-skin, fired by King Alcohol for the worship of Mammon" (p. 258).

The last date in Henry was more than four-score years ago. How comes it that a manuscript so valuable for history, adventure, topography, and especially anthropology was not printed long ago? It was, in fact, prepared after a fashion for publication in the first decade after its author's death. But the fur trade was already waning, boat-navigation ready to vanish away, settlements on the ground it covered and the comparative study of races not yet begun. So Henry, shelved in Canadian archives, slumbered in his own sheets, and might have slept on for ever save for Dr. Coues. But the indefatigable editor of Lewis and Clark and of Pike no sooner saw the neglected relic among the curios of the admirable Ottawa Library than he recognized its value. He beheld the doublet or triplet which he most desiderated to complete his magnificent endeavor to illuminate the world of the West during the early years of the nineteenth century. What he had accomplished for the United States from the Mississippi to the Western ocean, he could now do for the New Dominion, from the lakes to the same Pacific. But his editorial task was arduous. The Henry original was like his own whiskey when watered for Indians till a pint became a gallon—it was full of vain repetitions, or items of momentary and local interest, and everywhere couched in a bookish dialect which no man ever spoke and few could read. Then, again, as Henry wrote for himself only, his words needed elucidation on every page. This elucidation was supplied preëminently from the manuscripts of David Thompson, who, even before Henry, had traversed all his longitudes and latitudes, withal making such notes as we desiderate in all Henry's pages, and the very best of early maps. His name, therefore, fitly appears on the title-page and most other pages as a sort of Siamese twin to Henry. The commentary by Dr. Coues—derived from his own travels on Henry's track, his scientific studies, and Washington archives—proves that without it neither Henry nor Thompson would tell us all we seek to learn. Accordingly, the editor was convinced that his new light could not be shed abroad on the greater Northwest in less than three volumes. He loves that number like an English novelist, and has made his tomes counterparts of his three on Lewis and Clark and the same number on Pike. The three trios, each a complement of the other two, will, no doubt, remain standards for ages, each in its own field. Some pages in the first and second monumental trios we could more easily spare than as many from the third. The new-discovered material was often better for his purpose than whatever had been before available. Henry was a resident. Pike, and Lewis and Clark before him, were transient travellers. Theirs were the gleanings of months, his was the harvest of years.

It seems scarcely possible to add any fraction to the multitudinous minutiæ which Dr. Coues has accumulated. Who can add a line to what he tells us about the companions of Henry and all their namesakes, or to the fragments gathered up till they filled seven baskets, and, when no corner was found for them in the body of his work, garnered up alphabetically in his volume of index? The Greek who said that every big book was a big bore would banish these countless fractions and half the other letterpress. The truth is, that no page is valueless in this work, which was elaborated not so much to be read as to be referred to. Henry's writing has been manipulated by Dr. Coues much more than was that of Lewis and Clark by Biddle. In the Doctor's own words, his volumes are "a textual compromise between what he found written and what he might have preferred to write" (p. xiii). Without such a confession, every reader must have noticed words born since Henry's time, and turned over the pages with cumulative convictions that the composition was a "mingled yarn," not the unadulterated Henry. Accordingly, we regret that we are vouchsafed no page of Henry pure and simple. Such a sample—above all if in facsimile—would savor a whole volume. Such a facsimile Dr. Coues could not furnish, as the first copyist failed to preserve the photograph; but the original words—the old Bourbon without a drop of dilution—he could have set down before our eyes; at least such a dram as Henry gave to the sampling savage.

RECENT FICTION.

The Landlord at Lion's Head. By W. D. Howells. Harper & Bros.

The Choir Invisible. By James Lane Allen. The Macmillan Co.

The Missionary Sheriff. By Octave Thanet. Harper & Bros.

The Merry Maid of Arcady, and Other Stories. By Mrs. Burton Harrison. Boston: Lamson, Wolffe & Co.

A Pinchbeck Goddess. By Mrs. J. M. Fleming (Alice M. Kipling). D. Appleton & Co.

In the Tideway. By Flora Annie Steel. The Macmillan Co.

The Spoils of Poynton. By Henry James. Houghton, Mifflin & Co.

En Route. By J. R. Huysmans. Translated from the French by C. Kegan Paul. London: Kegan Paul & Co.; New York: New Amsterdam Book Co.

'The Landlord at Lion's Head' is an important addition to the list of novels in which Mr. Howells describes and interprets New England life and character. Jeff Durgin, the Landlord, takes rank with the author's most vivid characterizations—Silas Lapham, of Mineral Paint fame, and Bartley Hubbard, the Journalist. He is perhaps the most striking and effective of the three, for he has more of the uncommon, the unexpected. He is not a settled, conspicuous type, but an incarnation of signs of the times, rumors in the air, a concrete prediction of a type which threatens.

The accident of a wish to paint a picture of the "Lion's Head" brought an artist, Mr. Westover, to the Durgins' mountain farm, where he spent a week, involved himself for ever in the affairs of Mrs. Durgin, and began to feel the mingled liking and detestation for her ruffianly young son which were to prove an endless source of interest and irritation. Westover's part in the novel is subordinate but indispensable, for, like the disinterested family friends of French plays, he connects incidents, explains, interprets, carries every one's burdens, without deriving any profit and frequently against his will. During the fourth year of Jeff's formative experience at Harvard, Westover had a valuable and illuminative thought about him. From his point of view as a gentleman, sensitive, refined, and honorable, he had had occasion to feel deep disgust for Jeff's behavior and told him so. In the ensuing conversation, while Jeff, with perfect good humor and frankness, explained his point of view, it dawned on Westover that he was dealing with an earth-bound temperament, and that the "acceptance of a moral fact as it was, without the unconscious effort to better it or to hold himself strictly to account for it, was the secret of the power in the man which should bring about the material results he desired." This is to say that Jeff was a ripened product of the modern agitation, noticeable in life, literature, and art, about seeing things as they are. The much-coveted faculty was his by nature. He saw things barely, vividly, as they are, without prejudice, without pain, without

any complicating sense of moral responsibility to modify, to change. He included himself in this exact, unsparing vision. He had never quite believed in his good mother's notion of the great things that going to Harvard would do for him. Even in her isolation she had outlived the superstition that men are born equal, and her son suspected that a Harvard education could not make them equal. But he was willing to try, to see for himself, and know. He was superior to most men in beauty, force, will, temper; about scholarship he was indifferent; the only equality he cared for was social equality, and, before he had been a year at college, he saw and knew he could never get that. His vanity was hurt, but he was not disheartened or in any way discredited to himself. He made no struggle for the recognized unattainable, but he felt that there was a memorable day coming, soon or late, when he should get even with some one of the persons who represented this unattainable. By the episode with Miss Lynde he felt that he came out far ahead, and, when that was closed, the social grievance troubled him no more. His treatment of Miss Lynde is rather appallingly impudent and brutal; her brother's fraternal rage was properly expressed by a horsewhip, but a dispassionate observer must feel with Jeff's mother that she deserved all she got.

The incidental picture of social life at Harvard is so hideously snobbish that incredulity would be the reward of any writer with a smaller reputation for fair observation. Jeff was from the beginning a "jay"; and the condition of being a "jay" seems to denote neither deficient intelligence, nor indifferent morals, nor unpleasant manners, but to depend entirely on the almighty dollar. "Swells" are separated from "jays" by a line more rigid than aristocratic birth. A Samuel Johnson at Harvard would be a godforsaken "jay"; "swells" would forbid him the "yard," and the women of their set would speak to him as a princess might speak to a footman without the princess's courtesy and authority. If half of this be true, it would be wise for Americans of sense and taste to educate their sons at aristocratic Old World seats of learning, where there are opportunities to observe conduct considered becoming to a gentleman apparently not provided by the greatest American university. Mr. Westover's opinion that if this precious society had been kinder to Jeff, he would have been a better man, is a tribute to his own amiability, and an evidence of his sentimental inability to see things in the least as they are. Kindness from such a society might have diverted the course of Jeff's badness, but would probably have made him a worse because a weaker man. As Mr. Howells develops him and leaves him, he is an audacious, vindictive, selfish man, using his force for good or evil solely as the servant of his imperious will, and without any reference to effect on the moral order of the universe. His general attitude towards mankind is one of cynical toleration, and he never wishes to hurt any one who has not made the mistake of hurting him. He is not a bad man, but unquestionably the old romantic theory that it is finer to see things as they might be than as they are, has helped to produce much better men.

'The Choir Invisible' opens with a charming description of the primeval forests in Kentucky, a lovely girl riding along the trail on a white horse with knots of blue violets hanging at his ears. In the last pages, John Grey, the hero, looks back over a long and stormy life, glad that he has resisted evil and held fast to good; that, while missing an ideal happiness, he has won prosperity, honor, content, without losing faith in the beauty of what is right, or aspiration towards that perfection which is God. Seeing that Mr. Allen takes the imaginative, poetic attitude towards nature, animate and inanimate, he wisely chooses to tell a story of the end of the eighteenth, not of the nineteenth, century. In 1795 America was too young for cynicism and pessimism; there was a prejudice in favor of righteousness, an ingenuous belief in hell which kept men from shaking off the troublesome sense of moral responsibility as a garment. The virgin soil was not prolific of voluble critics identifying strength with rank selfishness, goodness with weakness, and proclaiming that the prizes of life are invariably captured by the wicked. Rare, indeed, are those resolute spirits that can hold their own against what all the world is saying; therefore, if John Grey's career was not ended—passed into history—we should be obliged to ask Mr. Allen how, in the face of the convincing Jeff Durgin, he can dare to offer such a fairy tale for the serious consideration of a grown-up public. But, as a member of 'The Choir Invisible,' John Grey is entirely credible, often admirable, and always lovable. Notably self-reliant, he was not beyond the influence of other people and circumstances. The external helps and hindrances are natural and probable. The lovely girl who rides the white horse was not good enough for him, and the lovely girl's aunt, Mrs. Falconer, was too good. The trivial accident which led the girl to jilt him was for him a stroke of good luck, and the virtue of Mrs. Falconer was his salvation. He was quite in her hands, body and soul, but she was a very good woman with a living husband, and as she loved John Grey enough not to let him speak, he rode away and saw her no more. Nothing in the book is more antique and poetical than this episode. A Mrs. Falconer of 1895, feeling heavily upon her the sacred responsibility of developing her *ego*, would have ridden away with John Grey to his everlasting ruin.

The tale is told in leisurely, discursive fashion; a manner that diminishes intensity but adds charm. The author has a poet's facility in the use of metaphor and simile, generally excellent and vivifying the sketches of frontier life and scene, in themselves strikingly picturesque. The political situation at the moment provides a reason for Grey's leaving Kentucky, but most of the discussion about Federalists and Democrats is a little outside the tale, a not interesting revival of a really dead past.

The tales told of 'The Missionary Sheriff' do great credit to his heart as well as to his nerve. The incidents chosen demand all those qualities without which no man ever dared to be sheriff of a Western town where a fringe of wilderness was visible from the main street. Amos Wickliffe had courage, a quick eye, a steady hand, and the unnamed faculty for making men feel that he could neither be frightened nor duped—never beaten. He had also a tenderness of heart which embarrassed him considerably in the performance of official duty, and always stood between the offender and injustice. His judgment about offenders was keen, and he was as prompt to shoot a desperate criminal on sight as he was ready to mitigate the punishment of the weakly erring. He was a good sheriff, a good American, a good fellow, with only one unpleasant habit, that of weeping before the portrait of a lady whom he called "Ma." Doubtless his emotion was as sincere as if he had said "Mother," but to those unaccustomed to the sound, the monosyllable "Ma," addressed to an object of love and veneration, is enough to destroy sympathy and to annihilate esteem. Octave Thanet is very conscientious in reproduction of local habits of speech, and as all her characters say "Ma," it is to be supposed that the word is shouted all over the prairies and echoed back from the Rockies. It is high time that Western legislators should turn their attention from big hats to forms of speech. A bill prohibiting the use of "Ma" and "Pa" on pain of death would eventually add grace and dignity to Western life, not to mention Western literature.

Throughout these stories the author is one with her characters. She is not poking fun, or apologizing, or satirizing, and thus succeeds in giving an inestimable impression of sincerity and actuality. Such qualities are not positively glaring in the 'Merry Maid of Arcady, and Other Tales.' It would be unkind to accuse the author of hypocrisy, but her attempts at criticism of a rich, vapid, pointless society are very perceptibly enfeebled by a reckless joy in infinite discourse on its houses, clothes, amusements, food—above all, on its footmen and maids. The god of love is ever present, but he shoots his arrows cautiously, resolved to dispense with tragedy, and even to forego his fun in such august and wealthy company. Down in Virginia he takes a little liberty, gets mixed up with impoverished lunatics and handsome scions of decayed aristocracy, but, awed by the prevalence of old mahogany, dim family portraits, and priceless porcelain, he stops short of license. Virginia has always grown tobacco, and used to grow slaves, but the wealth produced by these two industries fades into insignificance compared to that which, according to Southern novelists, is represented by its chairs and tables and china cups.

There is nothing in 'A Pinchbeck Goddess' to indicate that the author is the sister of a brother so distinguished in letters as Rudyard Kipling. Mrs. Fleming chatters away fluently about the goings on at Simla, that paradise of the improper. As an Anglo-Indian hill divinity, Mrs. Edwards fills the bill; she paints her face, dyes her hair, and dances (skirt dances) over prostrate warriors. Nevertheless, she is a perfectly virtuous lady, her appearance to the contrary being part of a mystery which, however improbable, is very well sustained. The warriors at ease are as far from idle gallantry as from ferocity. They have intentions serious and honorable. They make eloquent proposals of marriage and take the mitten like lambs, murmuring a tearful "God bless you" or "Farewell—Always better man—Having loved you." The accepted address their beloved as "child," and their obvious disapproval of the paint and dye suggests that immediately after a betrothal a great cleansing and scraping process goes on at Simla.

The most charitable thought about Mrs. Steel's 'In the Tideway' is that an early effort has been flung at the public to reap the benefit of her successful book, 'On the Face of the Waters.' A prologue introduces a lady and a lover, both aristocratic but poor, and both on the point of yielding to the exigencies of fashionable existence by marrying money. A shooting-box in the Hebrides is indicated as the scene of the coming drama, with the Gulf Stream and an island packed with skeletons in stone coffins for important machinery. Almost immediately after Mr. Eustace Gordon's marriage to a convenient American heiress, he proceeds *en garçon* to Roderay, the shooting-box of Lady Maud's rich husband, a person named Wilson. The chief end of Mr. Gordon's journey is to assure his own and Lady Maud's fidelity to their respective marriage vows. On the very night of his arrival, Lady Maud, tumbling by chance over Mr. Wilson's prostrate body, fears that he is dead, but Mr. Gordon, out of his ampler experience, assures her that her husband is only drunk. Then ensue agonies and consolations, during which the elasticity of the marriage vow is tested. When Lady Maud learns that her husband is kept sober only by the hypnotic influence of a valet, agent of a famous American medicine man, gloomy yet courageous she faces her future—that is, a conscientious second choice between Wilson and Gordon. Thus approaches the tragedy, and the Gulf Stream and skeletons, hitherto neglected, serve the use appointed for them from the beginning. When all is told, there is no appeal to reason, and nothing deserving of sympathy except the Gulf Stream turned to such base uses. This irrational tale is told appropriately with spasms, gasps, dashes, exclamation-points, and urgent appeals to God in heaven.

A certain degree of responsive sympathy with the collector's passion is absolutely necessary for enjoyment of 'The Spoils of Poynton.' Given that sensibility, however slight, Mrs. Gereth is an impressively tragic figure; without it, she appears as a quarrelsome person, probably mad, bent on depriving her son of property allowed him by law because she doesn't like the girl he wishes to marry. Fortunately for Mr. James, it is fashionable to care for things, old things, artistic things; and as fashion often serves as well as genuine feeling, he may be pretty sure of a large and appreciative audience. The lioness defending her cubs is a poor figure for ferocity compared with Mrs. Gereth beating off swine (particularly named Brigstock) from her pearls, the treasures of Poynton. She and her things are one, and whatever may have survived after the elements took a hand in the fray and swept Poynton from the face of the earth, it could be but a pale and soulless image of that ingenious, unscrupulous, and vindictive apostle of æstheticism. Her defeat by the terrible Brigstocks calls for tears much more peremptorily than does the defeat of her astute confidante and go-between, Fleda Vetch, by the chief of those children of darkness, Miss Mona Brigstock. Up to the point where Owen Gereth declares that he is free to rid himself of Mona, her bad taste, and sordid soul, free to love Fleda and happily end the tiresome squabble with his mother, one accepts the possibility of her consuming secret love for Owen. But at this point, loving Owen, loving his mother, loving the things, and having the whole game in her hands, it is difficult to believe that any girl, however subtle and high-minded, ever so deliberately surrendered everything to the enemy. The serious passion of the tale, however, is that of Mrs. Gereth for her things, and the expression of that passion is so perfect that it makes very little difference whether Fleda is a natural, human girl, or an incredible figure woven of whimsical fancy and subtle phrases. The fancy is fine enough and the phrases are good enough to afford a rare pleasure, of a kind which the author alone is able to give us in perfection.

The translator of M. Huysmans's 'En Route' says, in a preface, that the "true interest of the book is in the defence of monastic orders, and the description of such a life seen from very near." The description is undoubtedly interesting, but its value as a defence is small, because, for a Catholic, the monastic system needs no defence, and others can hardly fail to be offended, if not shocked, by a close view of the Trappists and other ascetic communities. It is even possible that an exposure of the mysteries, which probably takes the license of fiction, might appear to a devout Catholic blasphemous as the desecration of a shrine. After the miracle of Durtal's conversion, which is assumed in the beginning, his struggles to cleanse a decidedly filthy mind are narrated at great length with noticeable literary force and skill. The analysis of his fears, doubts, hopes, depressions, and exaltations is frank and radical, but the conception of a soul's travail is sensual and intellectual, while the operation of spiritual grace is only an assumption. The fascination of mysticism for certain natures is set forth with fulness of detail which makes it both revolting and ridiculous to other natures, and serves to fortify a common opinion that the agonies and ecstasies of mystics are mostly an abnormal exaltation of the senses wilfully deprived of natural outlets. The traditions of the Catholic church, its music, architecture, ritual, and imposing functions, are freely used to obtain effects sometimes intensely dramatic and sometimes cheaply theatrical. The translator credits M. Huysmans with a sincere intention to redeem wanderers from the faith; it is not hard to think of soberer methods which would surely be more efficacious.

The Outgoing Turk. Impressions of a journey through the Western Balkans. By H. C. Thomson. With illustrations and maps. London: W. Heinemann. 1897. Pp. xxi, 281, 8vo.

The irony of recent events has taken from the title of this volume much of its significance. In Macedonia the Turkish ruler has apparently a new lease of life, and in Thessaly he is, for the time, the returning, not the "outgoing," Turk. But, as applied to Bosnia and Herzegovina, the title is well chosen, when by Turk is understood the Osmanli official and not the Mohammedan. The former has gone. The latter remains, and enjoys equal rights and privileges with the Christian. To show what this change of rulers has done for the people of the two provinces, as well as to awaken sympathy for their countrymen still subject to Turkey, is Mr. Thomson's main object. His book, then, is not a mere traveller's narrative; descriptions of scenery, places, and incidents of his journey are mingled with accounts of the methods of government, of the social and material condition of the people, and with frequent historical digressions and political forecasts.

He had exceptional opportunities for seeing all parts of the country, not simply that on the main lines of communication, but the outlying mountainous districts which are rarely visited except by officials; and his experience of more than eight hundred miles in these regions, by diligence and post-cart, shows that travelling in Bosnia is unattended with either discomfort or danger. This security to life and property which prevails everywhere is one of the most striking results of the Austrian occupation. In a population of a million and a half, among whom brigandage and murder, twenty years ago, were crimes of daily occurrence, in the three years 1893-'95 there were only nineteen convictions for murder and five for robbery. This has not been accomplished by terrorism, as the army of occupation is only 23,000 and the gendarmerie 2,500 strong, but by the disarmament of the people and the awakening in them of a respect for law and personal rights. The courts have so little, in fact, to do that the number of lawyers, Mr. Thomson says with some hesitation as to the exact figures, is only sixteen for the whole of Bosnia and Herzegovina. This peaceful disposition of the people is the more remarkable, not only considering their past history, but from the fact that they are still divided by race and by religion. Yet there is apparently no indication of the existence of the century-old hostility between Mohammedan and Christian, and there are many instances of the opposite feeling. At a public dinner which the author attended in one of the smaller towns, "the Bürgermeister, a Mohammedan, formed one of the party, and was received on terms of perfect equality and friendship, not only by the Austrian officials, but by the Bosnian Christians, who were also present." At the theatre of Serayevo a Slav dramatic company gave a play, written by Prince Nicholas of Montenegro, called "The Empress of the Balkans." Though it dealt with the struggle between the Montenegrins and the Turks, "several of the latter were there, and seemed to enjoy it as much as any one." The Church of St. John at Yaitze is "venerated by Mussulmans and Christians alike," and on the saint's day is resorted to by pilgrims of both religions.

Mr. Thomson confirms the impression received from other recent writers that Bosnia is now the most interesting country in Europe to the traveller. This is due partly to the great beauty of much of the scenery, but mainly to the people themselves. Occupying the borderland, some of the characteristic features of both the East and the West are to be found in them. Fresh from India, Mr. Thomson notes curious resemblances between customs and superstitions of the Hindus and the Bosnians. But nearly everywhere are to be observed the picturesque differences of manners, dress, and habitations which arise from different nationalities and religions. Not the least interesting are the Spanish Jews, some seven thousand in number, whose ancestors were driven out of Spain three centuries ago, and who "still speak Spanish, and have preserved untouched most of their ancient customs and habits." Numerous facts are given

to show the growth of the provinces in population, in wealth, and in intelligence. Among the most significant is the increase of the peasant proprietors to more than two hundred thousand, many of the holdings having been bought through Government loans. Yet though much is being done by the Austrian officials to develop the resources of the country by building railways and roads, by practical instruction in the best methods of agriculture and other industries, by improving the breeds of horses, cattle, and poultry, they seem to have wisely avoided the fatal error of cultivating a spirit of dependence upon the Government. One of the books, Mr. Thomson tells us, which appeal most powerfully to Serb and Croat alike, is Smiles's 'Self-Help.' "A Croat told me it is more widely read in Croatia than any other book, and that he himself made a practice of always reading two pages of it every day."

The pleasant picture is naturally not without its shadows. A large part of the people are still very poor. The opening of railways has, for the time, depressed the trade of the towns, and the little local industries are unable to compete with the cheap Austrian and Hungarian goods with which the country has been flooded. The people, notwithstanding their wise and humane government, are discontented; "the Turks, because they have been deprived of power, the Catholics because they have been given less than they expected, and the Serbs because they desire independence." The mutual hatred and distrust between the Orthodox and the Catholics apparently still exists in all its strength. " 'A false people, the Orthodox, worse than the Turks,' a Dalmatian Croat said to me; 'if they ever obtain power here, I shall emigrate to America.' " This mastery seems not at all unlikely, since the Orthodox now form more than a third of the population, and are increasing more rapidly than either the Catholics or the Mohammedans. Their dream is of a "glorious and united Serbian kingdom, which shall stretch from Salonica to Zara," from the Ægean to the Adriatic.

The closing chapters are purely political, and the slight connection of some of the topics treated with the subject of the volume gives force to the presumption that they were hastily added to increase its bulk. In them the author strives, by showing England's responsibility for the present condition of the Macedonians, to arouse sympathy for them in their anticipated revolt. He believes that there is no danger to the peace of India in a strong anti-Turkish policy, touches upon Armenia, Cyprus, and Crete; demonstrates the impossibility of Turkish reforms, and ends with declaring the identity of Austrian and English interests, as against the policy of Russia, in strengthening Servia and Greece and in freeing Macedon. The real value of the book, which is very attractive in appearance, with numerous excellent illustrations, does not lie in this portion, but in its admirable account of an interesting country and its much-needed light upon the difficulties of the Eastern question arising from the different nationalities, religions, and ambitions of the inhabitants of the Balkans. Though it gives little hope of a speedy solution, it leaves two strong and abiding impressions upon the mind—encouragement from the new and striking proof which Austria has given of the regenerative power of a wise and just government; and indignation at the selfish and short-sighted policy which seeks to maintain and perpetuate Turkish misrule in Europe.

The Real Condition of Cuba To-day. By Stephen Bonsal. Harper & Brothers.

It does not need a severely critical eye to discover inconsistencies in Mr. Bonsal's little book. It contains one illustration, representing a starving family sitting under a palm tree; the baby is already dead, yet that one tree contains nearly a barrel of food, and there are other such trees in the distance. A starving family of Irish peasants could as well have been pictured sitting in a potato field in bearing. Occasionally Mr. Bonsal inserts a Spanish word in his text when an English word would serve the purpose much better, but he fails to tell us what we should much like to know, how the distinctive Americanism "long grass" is rendered in Spanish. He uses the expression frequently, and even attributes it to Weyler himself. Regarding the word trocha, he may have taken the definition from a little book published in New York last year, or he has fallen into the usual error of calling it "trench." But this is a trivial matter compared to his description of the Trocha, of which he speaks as though it were his common pastime to ride along it. He tells us that its "banks are lined throughout its length with at least ten thousand graves," and he compares it to the Suez Canal. The fact is, the Trocha has no banks, nor is it a canal, but a simple cart-road strung with barbed-wire fences and stone walls, and "its palmy days," of which Mr. Bonsal speaks, were long before he went to Cuba. He says that the "ditch which the poor conscript of Spain built has gone to rack and ruin, and the rains of the last month have well-nigh washed away alike all traces of their useless labor and their shallow graves." Now there never has been a single Spanish soldier buried on this Trocha. Whenever a soldier has died there, he has been taken to either of the adjacent cemeteries of Artemisa or Guanajay and given Christian interment.

When Mr. Bonsal tells us that Weyler has not five thousand soldiers "capable of marching from the Battery to Central Park with campaign equipment," what are we to think of the 400,000 Cubans who, he asserts, are being held down in starvation stations by these "wretched conscripts of Spain," who "are without those things which are the common necessities of life to the Digger Indian or to the most primitive and self-sufficient cave-dwellers"? The statement that Gomez has turned up in the rear of Weyler's 40,000 soldiers and given a good account of himself is amusing. For the last four months at least, Gen. Gomez has been in hiding somewhere in the vicinity of Sancti Spiritus, and Weyler, with all his troops, which Mr. Bonsal has a peculiar way of stretching from 5,000 to 40,000 as suits his requirements, has been unable to find him. It would be interesting to know what Gen. Gomez, with his army of 130 armed men and retinue of 200 servants will do upon turning up in Havana after the Spaniards have evacuated that city, as Mr. Bonsal assures us they are to do very shortly.

Calamus: A Series of Letters written, during the years 1868-1880, by Walt Whitman to a young friend (Peter Doyle). Edited, with an introduction, by Richard Maurice Bucke, M.D., one of Whitman's literary executors. Boston: Laurens Maynard. 1897.

We have here the series of letters to which John Addington Symonds refers in his 'Walt Whitman: A Study,' pp. 78, 79. There was something in that section of Whitman's 'Leaves of Grass' called "Calamus" which troubled Symonds not a little, so suggestive was it of a certain aspect of Greek life with which Symonds had acquainted himself painfully in the studies made for his 'Greek Poets.' He confessed his anxiety to Whitman, who wrote reassuringly, yet not so convincingly but that Symonds was very glad to see the letters to Peter Doyle which are now published, as Symonds earnestly wished they might be; and it is true, as he wrote, that "they breathe a purity and simplicity of affection, a naïveté and reasonableness, which are remarkable considering the unmistakable intensity of the emotion." It is true that the series is not complete, "perhaps three lost for each one preserved"; but it would be ungracious to imagine that a less favorable impression might have been derived from the whole correspondence than from a part of it.

There are quite enough of Whitman's letters: half as many would have been equally significant. But it would be very interesting to know how "Pete" "kept up his end" of the correspondence, and we have no means of knowing. In his introduction Dr. Bucke reports an interview with him eleven pages long, from which it would appear that his letters may have been as good as Whitman's or better. It is one of the pleasantest accounts of Whitman we have had. Of Garfield's kindly relations with Whitman there is an agreeable hint: "He always signalled Walt with the cry, 'After all not to create only.' " Why the correspondence dwindled after 1880, we are not informed. Doyle protests that "the same old love" was there until the end. "Then I had a mad impulse to go over and nurse him" is a literary touch for which Dr. Bucke is probably responsible. "There were things preventing," and he did not go. Their first meeting was late at night on a Washington horse-car of which Doyle was the conductor. It was storming fearfully, and Whitman, who had been visiting Burroughs, was the sole passenger. After 1872 Doyle was employed by the Pennsylvania Railroad, and railroad matters are often referred to in Whitman's letters. They had for him a remarkable fascination, and his interest in the hardships of the employees and their tragical misfortunes is one of the most engaging features of the book.

A single letter taken at random will give a better idea of them all than any second-hand account:

"*Brooklyn, Friday forenoon, April 5* [1872].—DEAR SON: I expect to be back in Washington next week—somewhere in the middle of the week—I am well—mother is pretty well—I received your letter three days since—Pete, things must be going on about the same as ever.—As I write it is pleasant weather, and I am going to get the good of it.—Pete, take care of yourself till I see you, dear boy. WALT."

All the letters are on about this level. Mr. Symonds found nothing of patronage in them, and there is nothing of this kind un-

less it be in their unvarying puerility, which is possibly Whitman's concession to his correspondent. The letters are such as might have been written by some illiterate person interested only in the most commonplace affairs. His health, about which there is much; the weather, of which he was keenly sensible; his meals, which he describes to praise them, never to complain—these things are the staple of them all. Douglas Jerrold's inference that some one had a great deal of wit in him, he let so little out, is, perhaps, applicable here. It is certainly astonishing that Whitman could write so many letters as we have here, and give no sign of intellectual ability or of his poetic gift. The fact gives us a sense of something artificial in his public manner; or was this inane simplicity put on? The kindness of his heart is unmistakable. He is often sending gifts of money to his young friend, and once shirts, the collar to be "turned down low, with a nice black silk neckhandkerchief tied loose," an endeavor to inoculate his friend with his own style. It should be said that much that he writes about his health is written to allay his friend's anxiety. The most pathetic feature is his loneliness in Camden after the failure of his health. He gets "desperate at staying in—not a human soul for cheer, or sociability, or fun, and this continued week after week, month after month." No one can read the book without a kindlier feeling for the man, but the poet never for a moment emerges into view, or in two or three epithets at the most.

BOOKS OF THE WEEK.

Allen, J. H. Sequel to "Our Liberal Movement." Boston: Roberts Bros.

E. Roth, 1135 Pine St., Philadelphia.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.

Agents for Clubs, Libraries, and all private collectors.

187 Piccadilly, London, W.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and South Africa; also make collections and issue Commercial and Travellers' Credits, available in all parts of the world.

BROWN BROTHERS & CO.
NO. 59 WALL STREET, NEW YORK.

CREST VIEW SANITARIUM,
Greenwich, Conn. An ideal home for health and recreation seekers. Beautiful scenery; very accessible: moderate rates. H. M. HITCHCOCK, M.D.

A NEW ROMANCE.

For the White Rose of Arno

A Story of the Jacobite Rising of 1745.

By Owen Rhoscomyl, Author of "Battlement and Tower," "Jewel of Ynys Galon," etc. Crown 8vo, cloth, ornamental, $1.25.

"This latest novel by the pleasing Welsh writer is one of the most powerful romances. The story is brimful of fighting, of hard travel and riding, and old-time love-making, and the flavor of old-world chivalry in the tenderer portions of the novel is charming and complete. With the pen of a realist, the author hurries his readers back to live over the dead, old wars, to dwell in strange Welsh castles that long ago crumbled into dust, and to view the history and romances of those early days as something tangible with our own existences. The style is always active, virile, and picturesque."—Courier, Boston, Mass.

Sold by booksellers. Sent, postpaid, on receipt of price, by the Publishers,

LONGMANS, GREEN, & CO.,
91-93 Fifth Avenue, New York.

YALE MIXTURE.

The choicest tobacco made, and preëminently a gentleman's smoke.

Marburg Bros., The American Tobacco Co., Successor, Baltimore, Md.

Educational.

With numerous full-page Illustrations. Crown 8vo. Cloth, gilt top. pp. 366. Price, **$5.00.**

Genesis of the Social Conscience.

The Relation Between the Establishment of Christianity in Europe and the Social Question.

By HENRY S. NASH,
Professor in the Episcopal Theological School, Cambridge.

8vo, cloth. Price, **$1.50.**

"Professor Nash's volume fulfils the promise of its title. It does more, indeed, for the author is something more and better than a mere epitomizer of other men's thoughts. Not only is his treatment of the great thesis which he has undertaken to discuss fresh and suggestive, but he shows himself to be a clear and original thinker."—From the *Tribune*, New York.

The Myths of Israel.

The Ancient Book of Genesis, with Analysis and Explanation of its Composition.

By AMOS K. FISKE,
Author of "The Jewish Scriptures," etc.

Cloth, 12mo. **$1.50.**

The author resolves the Ancient Hebrew Book of Genesis into its component myths, explaining their significance and bearing in the literary and religious development of the Hebrew people.

The Social Teachings of Jesus.

An Essay in Christian Sociology.

By PROFESSOR SHAILER MATTHEWS,
Chicago University.

Cloth. 12mo. *In Press.*

It is based upon the belief that Jesus as a strong thinker must have had some central truth or conception. Starting with this fundamental conception, the author endeavors to trace its application by Jesus himself to various aspects of social life.

Memorials of Christies. A Record of Art Sales from 1766 to 1896.

The Nation.

NEW YORK, THURSDAY, JULY 8, 1897.

The Week.

The final flurry in the Senate over the tariff bill brings out one fact in clear light: The American Congress is disabled from raising revenue. There was a great deal of solemn truth in what Senator Teller said on Monday. Quoting a former remark of Senator Allison's, that we had "more untouched and untaxed means of revenue than any other country in the world," he dwelt on the shameful spectacle of a Congress without the skill or the courage to reach out its hand and take the needed revenue, and asked if Senators were willing to go to the people and confess that they saw their duty, but were powerless to do it. Mr. Teller's two illustrations were the beer tax and the whiskey tax. The former had actually been proposed by the finance committee, who saw in it an easy and certain way of raising $20,000,000, but "a great election was pending in one of the great States of the Union where a large proportion of the population do not believe in a tax on beer; so it was sacrificed." That is to say, the brewers threatened Platt, Platt threatened the committee, and away went the tax. But if the committee could not raise revenue by increasing taxes, neither could it by lowering them. The maximum revenue rate on whiskey had been shown to be 70 cents a gallon. The present rate is $1.10, which had diminished the revenue and doubled the number of illicit stills. The Secretary of the Treasury recommended a 70-cent rate in the interest of revenue, but the Senate was powerless to take this $20,000,000 or $25,000,000 of added revenue. Powerful trade and political combinations were against the reduction, and so reduction in the interest of revenue could not be had.

That sweeping anti-Trust amendment to the tariff, which was going to prevent any monopoly from accepting the favors offered it, has been dropped. There were "vigorous protests" from Western Senators, but, you see, it would take too much time to discuss such an amendment now. This is clever management. When the duties favoring Trusts were pending, all objection was answered by saying that the judiciary committee were laboring night and day on an amendment which would make the Trusts fairly howl. Now, after the Trust-demanded duties are all safely in the bill, it appears that really the time is too short to throttle the Trusts this session. The clauses of the Wilson bill dealing with this subject are to be reenacted, but as they have been denounced as ineffective by Republicans over and over again, none but those who love to be deceived will be deceived. Altogether, the Republicans are getting into beautiful shape for the fall elections in the West.

"As far as I can see," said Dr. Johnson, "foreigners are fools." The Senate finance committee must think so, and that natives are fools, too, if it imagines that anybody at home or abroad will be imposed upon by the reciprocity amendment adopted on Friday. It is the final and fitting touch of humbug to what has been a work of humbug from the beginning. Observe merely how the arbitrary power given President Harrison by the McKinley reciprocity clause is slyly but thoroughly taken away from President McKinley. Mr. Harrison was empowered, whenever he might "deem" that other countries were not treating us fairly, to levy certain specified duties upon their products "for such time as he shall deem just." No more of that for Mr. McKinley. He may enter into treaties to admit "goods, wares, and merchandise" at 20 per cent. reduction of duty, but such reduction shall take effect only when such treaty or treaties "shall have been *duly ratified*." That is, the Senate retains control of the whole thing. When Senators who have moved heaven and earth to get prohibitive duties are willing to give them up, we may have reciprocity, but not till then. One more than one-third of the Senate will be able to upset any arrangement that the President may make.

Complete returns of the federal revenue and expenditure, during the fiscal year which ended June 30, enable us to measure the exact influence of the recent abnormally heavy importations under the threat of a retroactive tariff. Up to the close of February last, customs receipts during the fiscal year had fallen some $23,000,000 below the corresponding period of the year preceding. In the four months following February, on the other hand, the customs revenue ran $38,271,728 beyond the same four months in 1896; the whole year, therefore, showing on customs account a very considerable net increase. Without the threat of higher duties, supplemented by that of retroactive charges, there is no reason to suppose that revenue from imports would have risen, during these last four months, beyond the record of a year ago; it might have fallen considerably lower. There is, then, in the fiscal accounts of 1897, at least thirty-eight millions of revenue which is wholly anticipative in its nature. Unless the taxes of the fiscal year now opening prove vastly more productive than the taxes of last year, the Treasury will obviously find some trouble in making both ends meet. The estimate of the coming year's expenditure, moreover, submitted last March by the appropriations committee, showed that outlay, under the regular appropriations, will increase $11,746,629 over the fiscal year just closed. These figures sufficiently explain the worry and bewilderment visible during the past week among the financial oracles of Congress.

The great strike of bituminous-coal miners comes appropriately at the close of the debate on the new tariff bill. The rate on coal in the existing tariff is 40 per cent. ad valorem. It has been raised in the Dingley bill to 67 cents per ton, which is about double the present rate. This is intended to compensate the owners of the mines for the difference in wages between Canada and this country. As the miners here are working for 60 cents per ton, the inference is that the Canadian miners are working for nothing and paying their employers 53 cents per ton for the privilege of mining. As the tariff bill is on the eve of passage, and as the advance of wages demanded by the miners is only nine cents, the wonder is that they do not wait a few days and see whether their employers do not make the advance voluntarily. Apparently, they have not the smallest confidence in the efficacy of the tariff to increase wages, else they would postpone the strike until the Dingley bill takes effect, and then, with a copy of it in their hands, go to Senator Hanna, who regulates such things in Ohio, and confidently demand the nine cents increase of wages. If Hanna would not secure it for them, they could then go to Dingley, and if he failed them, they might rightfully appeal to the President. If Hanna, Dingley, and McKinley should all fail to secure them a petty nine cents advance in wages, after doubling the tariff on coal, it would be in order to ask them Why Not? An answer to that question would be worth millions of dollars to the laboring men of this country, not only to coal-miners, but to everybody. But instead of appealing to the political influence of Hanna to secure their end by peaceful means, we find them looking to the political necessities of Hanna to protect them against the Ohio militia in case there should be a resort to violence. It is confidently asserted that, while Mr. Hanna is a candidate for reëlection to the Senate, there will be no serious attempt to put down a riot.

The President's selection of John Russell Young to be Librarian of Congress

is the most deplorable surrender to the spoilsmen that he has yet been guilty of, and is the worst blow to civilized administration since President Harrison debauched the census by giving it over to Porter. The appointment is fitly entitled in the press "A place for Mr. Young." Precisely. He has no qualifications whatever for the position. He is nothing but a journalist who, for reasons which it is unnecessary to recall, long since ceased to hold anything like a permanent or high position in his profession. He established his "claim" upon Mr. McKinley by taking up his residence at Canton during the campaign of last year, and writing to a New York newspaper a daily letter filled with nauseating personal flattery of the Republican candidate. It would be bad enough to recognize this indecent "claim" by giving Mr. Young a political office, but to put him in charge of one of the greatest libraries in the world, just housed in a superb building, is public advertisement that that institution is to be manned by political appointees. With the librarianship itself awarded as a "place," what chance is there that the 187 subordinate positions will be filled in any other way? Mr. Spofford sought in vain to have these positions placed under civil-service regulations, in order that examinations for them might be held in the 700 cities of the country, and the Library might thus reap the inestimable advantage of securing the best expert talent that the entire country could supply. The President has overruled him, and taken the step that will go far to prevent the employment of any such talent whatever.

The President, by allying himself with Platt and his rotten machine at this time, has done all that he could to prevent the success of honest government in this city. Platt is the chief obstacle to the nomination and election on a non-partisan ticket of candidates pledged to give the city the best government possible; he is openly opposed to that kind of government, and, rather than allow it to succeed, has threatened to help Tammany to win. For the President of the United States to strengthen the hands of such a disreputable boss as Platt at the very moment when he is fighting desperately against honest government, is a most humiliating prostitution of the highest office in the land to base partisan uses. The President knows what kind of politician Platt is; knows what his methods are, and what his power rests upon. He knows that the most eminent and highly honored Republicans of this city have pronounced Platt's city organization to be so rotten, so based upon deliberately planned and wholesale frauds, that it "cannot command the confidence of the Republican party nor of the public," and that "honest and self-respecting Republicans cannot support" it; and in full knowledge of all these things, he leagues himself with Platt and not only against the honest men of his own party, but against every independent and every hard-money Democrat who voted for him last November.

The nomination by President McKinley of George R. Bidwell for Collector of the Port of New York is a case in point. The office is the most conspicuous and important place in the federal service in the metropolis of the nation, and the nation is always interested in the disposition which is made of it by each new Executive. Ever since Mr. McKinley's inauguration it has been universally recognized that his appointment to the New York collectorship would be the crucial test of his Administration, so far as the chief State in the Union is concerned. The President has given this place to a man who represents nothing but the machine which Platt has built up. This means an end of the admirable management of the great office on business principles, and the restoration of the spoils system just as far as ingenuity can evade the present restrictions. The Platt machine will now try to have the places of deputy collectors and cashiers removed from the range of competition, and there is too much reason to fear the success of the attempt. On Friday the President appointed Asa W. Tenney United States Circuit Judge of the Eastern District of New York. Mr. Tenney is a working politician of the "wheelhorse" type, whose chief claim to the position is a lifetime of "loyal devotion to the party." Nobody would ever have thought of selecting him for the position because of his legal attainments. It is very plain that Mr. McKinley is completely in the power of the bosses. They have "got him under" and they will stop at nothing in their demands upon him. President Harrison never allowed politics to interfere with his judicial appointments, and under him no such aspirant as Mr. Tenney would have stood any chance of appointment. No one seems to have proposed him to McKinley except Platt, for the appointment caused general surprise in Brooklyn and amazement in New York.

The welcome news comes from London that Croker has decided to return to this city and take charge in person of Tammany's campaign. He says, "Tammany is sure to win," and that he would not return unless he was convinced of that. This is frank and characteristic. So long as Tammany was out of power and the profits of the boss-ship were slim, he was willing that Sheehan should hold the position on a basis of joint share in the profits known only to Sheehan and himself; but the moment that he thinks there is a chance for Tammany to get back into power, he decides to resume control in order that he may get "all there is in it" for himself. It has been rumored in Tammany circles that the fortune which Croker accumulated while active boss has been much depleted by losses in horse-racing and horse-farming, and by extravagant living expenditures, and that he has been anxious to build up another one just so soon as conditions in New York would permit. Of course, we all know he built up his first one through "real-estate speculations," and it will possibly be a cheering piece of news to New York property-owners that he foresees a new opportunity of the same kind. A queer thing about the rise of his real estate is that it occurs when nobody else's appreciates in value. His return will be useful in impressing upon our voters a full realization of what the restoration of Tammany to power will mean, namely, the accumulation of new riches for Croker and Gilroy and other statesmen who are now living luxuriously upon the wealth which they got out of the business of ruling New York a few years ago.

The new civil-service rules for this State, adopted on Thursday, make the minimum marking for "merit" and "fitness" 35 per cent. for each. The appointing officers may in their discretion hold the "fitness" examination, or designate the State Civil-Service Commission to conduct both. Any appointing officer who wishes the good of the service will do the latter; any one who wishes to debauch the service will do the former. The rules provide, it is true, that he must, if he reserves the "fitness" examination for himself, certify to the commission that the ratings for fitness were determined by "competitive examination"; but as he determines what is fitness, he can easily arrange the competition so as to bring the right name out of the box. This is of course the object of the law—to restore to the appointing officer the right to pick out his own man, and relieve him from the obligation to take only a man proved fit by a test established by law. What the Court of Appeals will say to all this we do not know, but many lawyers who have examined the matter without bias have come to the conclusion that such rules constitute a mere verbal juggle, and are in flat defiance of the constitution.

To take only a single point, the new law and the rules under it are based on a totally imaginary distinction between two undistinguishable tests—that of "merit" and that of "fitness." Not only is no such distinction recognized in ordinary speech—the competitive system being generally spoken of as the "merit system," and appointments under it being said to depend on "fitness"—but the

Constitution follows the common usage in making no distinction, and describing the test as a single one of "merit and fitness" determined by competition. To our minds the scheme would have had more semblance of constitutionality if the boards had been abolished and the appointing officer in every case been directed to hold a competitive examination. However this may be, we doubt if the new system will satisfy its friends in its working. They have not got rid of a real competition as the basis of the system, and in many branches of the civil service, wherever there is an honest head of a department, the "merit" and "fitness" examinations will be blended, which will in so far defeat the spoilsmen's objects.

The Democratic State convention in Ohio last week showed anew, like previous similar gatherings in Kentucky and Iowa, that Bryanism is in complete control of the old party organization throughout the country. There were controversies over candidacies, but they involved only questions of personal influence and ambition. As regards the endorsement of the whole Chicago platform of 1896, and particularly its free-coinage plank, the convention was unanimous and enthusiastic. In this attitude Ohio Democracy is consistent with the bad record which it has made for a generation. This year, accordingly, the voters are given a choice only between a Republicanism which offers Senator Hanna as the perfect flower of the party and evades committing itself to any financial policy by "pledging anew allegiance" to the platform on which the country was carried for McKinley last year; and a Democracy which presents that embodiment of financial unsoundness, Gen. A. J. Warner, as the maker of its platform, while various millionaires squabble among themselves for control of the machine, and of the governorship and senatorship, which are at stake in the election. The only redeeming feature of the situation is the declared purpose of the National Democrats to hold a convention and nominate a ticket on the basis of the Indianapolis platform of last year.

The recent meeting of the Georgia Bar Association furnished impressive evidence of the hold of the lynching spirit upon public sentiment in the South. One of the most prominent lawyers in the State made a speech in which he openly justified the execution by the mob of any man guilty of assault upon a woman, and declared that no change in the laws or in their administration would ever stop the practice. Other members of the association showed their concurrence with these ideas, and it really looked as though a body of lawyers might endorse the theory that laws cannot be so framed or enforced as to meet all the exigencies which may arise. Happily, there was one man who realized the disgrace which threatened the association—ex-Congressman N. J. Hammond—and a vigorous protest from him turned the tide, and led to the adoption of a resolution declaring that the body "condemn lynching in all its forms."

A dreadful report it is, in the account of the jubilee naval display at Portsmouth, that the official representative of the United States navy declared that he should "advise any country proposing to make war first to ask the counsel of England." Now if Admiral Miller really uttered this terrible sentiment, he is a candidate for direct censure by the Navy Department, and happily we have in Mr. Theodore Roosevelt an official thoroughly competent to administer the proper rebuke, and explain to our naval representative in the first place that his opinion is wholly unfounded; secondly, that, supposing it had any foundation, he had no business to express it. Every good American knows that if the patriots who administer the affairs of the United States wish to go to war, they have no occasion in the world to consult England. In fact, they have no business to consult England on any subject, whether of war or peace. Consult England, indeed! Is it possible that any Admiral of ours was pusillanimous enough to be overawed by the show navy of the jubilee? But even if he had been, it is most inexpedient for any of our representatives to lead England to suppose that we have any reason for deliberation when it comes to war. Any such ill-considered speech might indicate to the grasping government of Lord Salisbury, ever eager to seize any opportunity of taking advantage of a neighbor's weakness, that we were really unprepared for war—a fact to be used only to get big appropriations, never to be blurted out in public.

The protest of the delegates from the grain, produce, and milling trades of Germany against the Boerse reform law as "a serious and unwarrantable injury to trade," and their expression of sympathy with the Berlin corn and produce dealers in the struggle forced upon them by the Government, is a matter which ought to attract a great deal of attention all over the world. The German Boerse law is a law by which the Government fixes prices. This is the dream of Socialists everywhere; and if prices are to be fixed by anybody, there are no officials in the world better fitted for the work than those of Prussia. They are strictly honest and well-educated, and are supplied by the most thorough machinery in the world with the latest and most accurate information. The intention of the law is that they shall keep prices stable—neither too high nor too low, so that they will "just about" represent the actual immediate value; this, of course, breaks up "futures" and "options." Yet what is the result? Nothing but the usual dissatisfaction among those engaged in business, who complain that the act is an interference with the laws of trade. One of the things the delegates did last week was to record the opinion that "time bargains," or options, were a necessity in fixing prices, or, in other words, that the law tended to unsettle prices.

The Government, however, is said to be prepared for this treason, and the "Agrarians" have a card up their sleeve which they should certainly now play—that is, a regular universal international price treaty to fix quotations by agreement all over the world, and to stop "options" not merely in Berlin, but "from Alpha to Omaha." This idea is derived from the bimetallic proposals which have made such headway in the last few years, but it is better because it is more comprehensive. Indeed, the two plans ought to be united; the price of silver is what the currency reformers need to fix. Options on silver may not be common, but silver must be sold on "time," and the question of the ratio would be wholly immaterial if the price could be fixed once for all at twice what it now is. The truthful Prussian *Commissar* might object to this, on the ground that telling lies about prices is out of his province, but he must be induced to waive his prejudices.

The disastrous failure of the great Socialistic glass-works at Albi, France, is accounted for by its chief promoter, M. Jaurès, as caused by a refusal of credit to the concern. Those who furnished its raw material were not willing to extend the usual credit, and so the crash came. The moral is, according to M. Jaurès, that here is another attack on the fundamental rights of man. Among those he places "the right to credit," and it must be said he has in this phrase hit upon something much more deep-reaching than the famous "right to work" of 1848. Anybody can see that the right to labor, to choose your own employers and fix your own wages, precious as it is, does not compare in significance with the right to credit. Grant that freely, and the other rights of man could be surrendered without loss. It is reported, however, that this new article of the Socialistic creed is coldly received in its very cradle, so to speak; the keepers of the *cabarets*, where society is mainly being reformed in France, say brutally that the right to credit will never do at all as far as they are concerned. Oratory may be as free as men like, but drinks mean spot cash.

MR. SHERMAN'S REPLY TO JAPAN.

Mr. Sherman's reply to the protest of Japan against the Hawaiian annexation treaty declares that the protest "strongly suggests confusion between the formal stipulations of treaties and the vested rights which the subjects of one country may acquire in another under treaty or the law of the land." He then quotes Halleck, Wheaton, and other authorities to show that the obligations of treaties expire in case either of the contracting parties loses its existence as an independent state, or in case its internal constitution is so changed as to render the treaty inapplicable to the new condition of things. "As to the vested rights," he says,

> "if any be established in favor of Japan or of Japanese subjects in Hawaii, the case is different, and I repeat what I said in my note of the 16th inst., that 'there is nothing in the proposed treaty prejudicial to the rights of Japan.' Treaties are terminable in a variety of ways; that of 1886 between Japan and Hawaii, to which your protest is supposed to relate, is denounceable by either party on six months' notice, but its extinction would no more extinguish vested rights previously acquired under its stipulations than the repeal of a municipal law affects rights of property vested under its provisions."

This reply is open to the criticism that it tells the Japanese what they know already, and refuses them information or guarantees against the danger foreseen by them, and which has led to their protest. The Japanese have not intimated that the treaties of a country survive its absorption by another, except as obligations binding upon the annexing country, in favor of rights acquired under them; and what Japan wants to be assured of is the survival of these rights. To this Mr. Sherman virtually replies, Don't be alarmed; treaties will disappear, but vested rights cannot disappear, because they are vested, and a right once vested is vested, and that is the end of it.

The correspondence which led up to this final declaration about vested rights makes the attitude of our Government in the whole dispute quite clear. On June 15 the Japanese Minister called Mr. Sherman's attention to the rumor that Hawaii was to be immediately annexed by a treaty affecting rights acquired by the Government of Japan, and by Japanese subjects, by means of treaties with Hawaii and "under the Constitution and laws of that country." He, therefore, said that he must repeat what he had already "had the honor to state" (in a previous interview), that Japan "cannot view without concern" the prospect of annexation, and must inquire what provision has been made in the treaty "for the preservation and maintenance of the rights acquired and enjoyed by Japan in her intercourse with Hawaii under the solemn sanctions of law and of treaty." To this Mr. Sherman briefly replied on June 16 that the treaty had been signed, and that, according to his understanding

> "The Government of the United States does not take upon itself any obligations of the Hawaiian Government arising from treaties or conventions made by it with other governments. It is believed that there is nothing in the treaty prejudicial to the rights of Japan."

On receiving this reply the Japanese Minister communicated with his Government, and on June 19 wrote again to our Secretary of State, stating that he had been instructed to formally protest against the annexation for the following reasons:

> "First—The maintenance of the *status quo* of Hawaii is essential to the good understanding of the Powers which have interests in the Pacific.
>
> "Second—The annexation of Hawaii would tend to endanger the residential, commercial, and industrial rights of Japanese subjects in Hawaii, secured to them by treaty and by the Constitution and laws of that country.
>
> "Third—Such annexation might lead to the postponement by Hawaii of the settlement of claims and liabilities already existing in favor of Japan under treaty stipulations."

Mr. Sherman's reply to this protest, which we have analyzed above, deals mainly with the second and third of these points. We have not thought it worth while to go into what he says about the first, because obviously Japan knows just as much about what is essential to the good understanding of the Powers which have interests in the Pacific as Mr. Sherman does. This branch of the protest is merely a polite way of saying that the maintenance of the *status quo* is essential to the continuance of a good understanding between Japan and the United States. There is no reply to such a statement, except the one which Mr. Sherman makes, that the Powers other than Japan have not objected; which is merely tantamount to saying that as long as nobody but Japan protests, the understanding is good enough for our purposes.

The sum and substance of the whole correspondence is that we snap our fingers at Japan. It must be remembered that there is no such thing as a right to annex a country, and that Japan, if its interests are affected, has just as much right to prevent our annexing as we have to annex. So far as interests go, Japan has apparently greater interests than we. Consequently, when we talk of the effect of annexation in wiping out a treaty, all that we mean is that we are going to wipe it out, and that the Japanese can do what they please about it; when we say that "vested rights" under the treaty will be preserved, we mean that our courts and legislatures will respect what they regard as vested rights, and no others. In other words, the Japanese rights in Hawaii are now protected by treaties having behind them, of course, the readiness of Japan to prevent their violation; for this we propose to substitute our will. What the precise result may be, what view the courts and Congress may take of the whole subject of Japanese rights in Hawaii, is neither here nor there. We propose to dispose of those rights ourselves. If Japan objects, and we refuse to discuss the matter, we defy her. But defiance is the very "note" of the new foreign policy, and this is what gives our dispute with Japan most of its importance. Another marked feature of it is contempt for all treaties, or rights acquired under them, which would interfere with a general attitude of defiance. If England objects to our taking possession of the Nicaragua route, and points to the Clayton-Bulwer treaty, defy her to do anything about it; if half-a-dozen foreign governments protest against our tariff, and recall the "most-favored nation" clause, pay no attention to what they say; if Japan makes a polite inquiry about her rights in Hawaii, laugh at her.

It is a fact observed long before Mr. Sherman was born, that governments whose power rests on corruption and intrigue, and which, therefore, need to divert public attention from domestic affairs, generally try to do it by means of a violent foreign policy. This they expect will make them popular at home. But as it is not the violence but the success of a foreign policy which makes it popular, and as the corruption by which they live prevents their permanent success in anything, the end is not usually what they hope for.

THE FISCAL YEAR 1897.

With Wednesday, June 30, closed the Government's fiscal year 1897. The excess of expenditures over receipts for this fiscal year, reported at Washington on Thursday, was $18,623,108, against a deficit of $25,203,245 in the fiscal year 1896, $42,805,223 in 1895, and $69,803,260 in 1894, the low level of our Government's finances. This steady cutting down of the annual deficit has resulted chiefly from the natural increase in the revenue as trade revived; the receipts of 1897, for instance, rising some $68,000,000 over those of 1894. As compared, however, with the two preceding fiscal years, the rising revenue has been seriously handicapped by the renewed extravagance of the Congress whose term expired last March. Between 1894 and 1896, annual Government expenditures had been cut down upwards of $15,000,000; for the fiscal year just closed, the Fifty-fourth Congress deliberately increased the annual outlay nearly fourteen millions, and, unfortunately, the appropriations for the coming year are even larger.

Nevertheless, results for the fiscal year just closed are far more favorable than seemed possible a year ago. In submitting his estimates to Congress, December 15, 1896, Secretary Carlisle predicted for the year ending June 30, 1897, on the basis of existing laws, a total revenue of $318,000,000, total expenditure

of $382,500,000, and hence a deficit of $64,500,000. As a matter of fact, the revenue has run twenty-nine millions beyond his estimate, while expenditure has fallen nearly seventeen millions below it. So far as the revenue is concerned, it is clear that "existing laws" have not applied; for since the opening of March, customs receipts have nearly doubled under the whip of the retroactive tariff clause. In the matter of expenditure, the Secretary based his estimate on very insufficient data—a criticism which must stand against the great majority of his financial forecasts. The fact, however, that the revenue this year has been artificially expanded upwards of thirty millions by customs receipts normally chargeable to the coming fiscal year, and that appropriations for the coming year have been materially increased over 1897, throws considerable doubt over next year's results. Senator Aldrich has with sufficient clearness pointed out these doubts to Congress.

Very rarely has any nation witnessed such extraordinary ups and downs of fortune as have befallen our Treasury during the past ten years. In 1888 the Secretary's annual report showed a surplus of income over expenditure, before meeting the sinking-fund requirement, of $119,612,116; in 1894 this surplus had become a deficit of $69,803,260. This represented a change for the worse upon the Treasury's annual balance-sheet, within six years, of upwards of $189,000,000—a fluctuation, we are confident, never before experienced by a modern state except in time of war. It is true, our revenue system is peculiarly sensitive to industrial conditions. The surplus revenue in 1870 was $101,601,917; in 1874, a year marked, like the fiscal year 1894, by the low ebb of trade depression, the surplus fell to $2,344,882. In both these panic years the decrease in the ordinary sources of revenue was exceptionally great, simply because the blight upon the nation's consuming power dried up the springs of revenue from both home and foreign trade. There is, however, one striking difference in the finances of these two periods—a difference which goes far to explain both the enormous deficits of recent years, which did not occur in 1874, and the recent prolongation of the troubles of the Treasury. The decrease in the federal revenue during the panic periods of the seventies was very heavy; much heavier, in fact, than the decrease after 1888. But this fall of revenue a generation since was largely offset by decrease in the annual expenditure, between 1870 and 1874, of $22,500,000. No one will fail to remember how very differently the Congresses of recent times dealt with this question of expenditure. Between 1888 and 1894, the annual revenue declined some $81,500,000; within the very same period, annual expenditure actually increased nearly $108,000,000. The Government's disbursements on ordinary account, under the appropriations of the last Congress, have reached this very fiscal year a total of $13,000,000 in excess of the outlay during 1896.

There is no use in blinking these facts. Had the Congress of 1890 and the two ensuing years placed even a moderate restraint upon the tendency to extravagance, the surplus would indeed have been heavily reduced, but no such embarrassment as a forty or sixty million deficit would have been heard of. This is no matter of mere assertion; the Treasury's own returns are witness to it. There was in 1894 a deficit of $69,803,260; had annual expenditure been in 1894 what it was in 1888, the Treasury would have returned at the year's close no deficit whatever, but a surplus of $38,068,061. In this fiscal year 1897 the Treasury reports a deficit of $18,600,000; if the year's expenditures, instead of rising to the $365,000,000 shown by the annual report, had been kept down to the $259,653,958 returned in the report of 1888, its operations would have left a handsome surplus revenue of $87,000,000.

We appeal to the common sense of our public men and newspaper critics to demand that an end be put to the humbug about "deficient revenue." The individual who lives habitually and deliberately beyond his means will always find his revenue deficient when settlement-day comes around; if his income rise to fifty thousand, against a bare five thousand a few years since, he will still be borrowing and struggling with his creditors. In private life no phenomenon is more familiar; but the principle applies no less distinctly to governments than to individuals.

Eight or nine years ago, the cry was raised on every stump and in every market that the Government's revenue was too large, and there was ample ground for the complaint. A very unjust and stupid bill was introduced to cut down this excessive revenue; but unjust and stupid as it was, it did after a fashion serve its purpose. Congress, however, did not stop with that. The instant it was learned that the Administration had instructed a willing Congress to "reduce the surplus," an army of pension jobbers and lobbying contractors descended on the capitol to tell the nation's legislators how to manage the reduction. Within five years—from 1888 to 1893—the annual expenditure for pensions had increased $78,069,049, while annual miscellaneous disbursements, including all the huge contractors' undertakings, had risen $30,780,539.

That this was done at the very moment when the spokesman of the party then in control of legislation was estimating a reduction of $42,000,000 in the annual revenue, would seem to argue something not far short of legislative insanity. Yet it was these very congressional Pecksniffs who turned mournfully to the people, when financial panic had set its seal on their own stupid extravagance, and lifted up their voices to bewail the "deficit-making administration" which had inherited the wreck from them. If good times in general trade return, we shall undoubtedly see, with or without a Dingley tariff, a heavy increase in the revenue; we may report another surplus. But how long does any one suppose a surplus will continue with the appropriation machinery of Congress in its present state? Is it to be conceived that legislators who will increase annual public outlay $26,000,000 within two years, on the heels of a $69,000,000 deficit, will turn their greedy eyes away from an exchequer which reports a surplus?

ABUSE OF THE TAXING POWER.

None of the principles laid down and enforced in Mr. D. A. Wells's articles on taxation now appearing in the *Popular Science Monthly* is more important than that of singleness of purpose. As he states it, the power of taxation should not be invoked for police purposes, but should be strictly limited to the raising of revenue to meet legitimate state expenditures. The wisdom of this rule is illustrated by Mr. Wells through many references to judicial decisions and to the experience of the past. But the experience of the present, as shown by the debate now going on in the Senate over the tariff bill, and, indeed, by the bill itself, is perhaps more suggestive than anything that has hitherto taken place in our history. The pages of the *Congressional Record* are crammed with crude arguments for accomplishing all sorts of ends under the form of raising revenue, and some account of these arguments may be of service in drawing popular attention to the mischiefs on which Mr. Wells dilates.

The cry which many of our statesmen now believe to be most popular is, of course, that against trade combinations to raise prices and to secure monopolies. On this issue the Republican party necessarily occupies an invidious position. It is in the act of adopting a measure that is undeniably intended to raise prices by eliminating competition, and its opponents are untiring in their attempts to expose the encouragement to trade combinations which such measures involve. As the Republicans profess no less zeal than their opponents in the campaign against these combinations, the dilemma presented to them is certainly an awkward one, but the dialectical skill which they exhibit in avoiding it and in beclouding the whole subject, must command admiration. Under the pressure of debate they have finally secured a strategic position that must be regarded as substantially impregnable, at least so far as the artillery of the Populists is concerned.

The chief features of this position are as follows: Nothing is more detestable than a combination to raise prices; but every American must concede that a combination of foreigners for this purpose when they are supplying our markets is more shocking than a combination among our own citizens. If we are to be plundered, it is obviously better that the spoils should be kept in our own country. We may, perhaps, be able to compel some of our wicked corporations to disgorge a part of their ill-gotten gains, or even to prevent them from carrying out their nefarious conspiracies. But the foreigners are beyond our control. We cannot make them restore their plunder, and in some of the effete monarchies of Europe, trade combinations to regulate prices are actually encouraged and protected by law. But if we put high duties on the goods which they sell to us, we have them at a disadvantage. We can then restore to our people some of the money which has been extorted from them if imports continue; and if we exclude foreign competition, it is the A B C of protective doctrine that our own citizens will then eagerly compete with one another and bring down prices to a satisfactory level.

Senator Platt of Connecticut has stated this argument in a most telling way. Soda ash is a commodity much used in the manufacture of soap, and large quantities are now imported. The bill before the Senate imposes a tax of three-eighths of a cent a pound on this article, which, selling in Liverpool at one-fifth of a cent a pound, there would result an estimated protection of 185 per cent. By one of the curious inconsistencies that mar the symmetry of the protective system, this statement was presented to the Senate by Mr. Sewell of New Jersey, with the additional information that all the soda ash in this country was made by three large corporations. By one of the defects that equally disfigure the application of Populism, Senator Stewart of Nevada supported the increased duty, with the cheerful remark, "Do not be afraid of Nevada getting too much." But Senator Platt was equal to the occasion. He routed the opposition with the statement that the United Alkali Company of Great Britain was the most powerful Trust or combination in the world, "probably the closest and most grinding monopoly on the face of the earth." Those who opposed the duty of 185 per cent. were therefore trying to destroy the manufacture in this country in order that it might be entirely monopolized by this abominable foreign combination. Were they successful in reducing the duty, this monstrous corporation would crush the American manufacture and then raise the price of soap to the American people higher than it ever was before.

We confess that Senator Platt seems to us to have got the better of the anti-monopoly Senators. They made no attempt to meet this argument, and it is difficult to see what answer they could make. Senator Lindsay did indeed point out that the importation of soda ash had declined one-third under the present tariff; but Senator Lindsay probably believes in discouraging monopoly by having free trade, and his argument was irrelevant from the anti-monopoly standpoint. From that point of view the chief aim of a revenue bill is to strike down combinations. If it can be shown that they will be checked by protective duties, then protective duties must be applied. Fallacy for fallacy, we do not see why that of the Republicans should not be more popular than that of their opponents. We must have revenue, and if it be true, as the Populists contend, that every branch of trade is now in the hands of corporate monopolies, the proposal to take off all duties on commodities in the manufacture or sale of which a combination exists would bankrupt the Treasury. The Republican tariff bill is a discreditable and injurious measure; but many of the arguments used against it in the Senate are based on quite as mischievous a theory of the taxing power as that of the protectionists. In truth, at bottom these theories are the same.

MUNICIPAL OWNERSHIP.

The second issue of *Municipal Affairs*, published quarterly by the Reform Club of New York, contains a discussion of municipal policy that is of unusual interest. On the one hand, Mr. Edward M. Grout argues that New York should own the gas supply. On the other hand, Mr. Allen Ripley Foote contends that no government should operate an industry. The very titles of these arguments show the chaotic state of thought upon the whole subject of municipal policy. The issue between the combatants is not clearly apprehended. Mr. Foote may succeed in proving his point; but Mr. Grout's point relates to ownership, not to operation. As a matter of fact the contestants do meet at close-quarters; but their differences are for the most part over matters of fact, although some of their principles are irreconcilable.

The claim that cities should own the chief appliances for promoting the welfare and convenience of their inhabitants, like the agitation in favor of progressive taxation of rents, has its origin in the concentration of wealth and population resulting from the immense development of the means of transportation. This concentration has greatly increased the value of land in our cities, and it has at the same time increased the value of such rights in land as have been acquired by the gas companies and the street railways. To a considerable extent, although not to the degree assumed by Mr. Grout, these rights are exclusive, like the ownership of land in general, and unless properly regulated may result in oppressive monopolies. Probably there would now be quite general assent to the abstract proposition that no grant of exclusive rights should be made by a city, or for a city by the State Legislature, without provision for terminating the grant at some future period and at some fixed price. The conviction that there is an "unearned increment," an increased value arising from the general advance in civilization, and not from the exertions of proprietors, is now too strong to make it safe to grant franchises in perpetuity and for no apparent consideration, were it otherwise desirable to do so.

While this conviction will probably check such grants in the future, it is too hasty to assume that the purchase of existing plants and franchises is desirable. We must remember that the rate of interest has now fallen to a lower point than ever before, and that we cannot look for an indefinite increase in the value of lands or franchises. The franchise of the elevated railroad may presently lose much of its value by the construction of an underground system. The gas companies may suffer from new discoveries in lighting, Hardly anything but water is certain to be needed in the same form and under the same conditions as at present. For these reasons the policy of purchasing the rights of existing "monopolies" is a dangerous one. The city may make bad bargains, and although it may seem wealthy because of its landed possessions, it is, strictly speaking, no better off than if the title of these were vested in individual citizens. The sum total of wealth would be the same, and to regard the city as a whole as richer on this account, is like reckoning the national debt as a part of the national wealth. The rents received by the municipality would be no greater than those received by private owners, and whether the disposition of these rents would be more for the general good or not, experience proves would depend on circumstances.

It does not seem to be always recognized in these discussions, that charges made by a city for necessaries, such as gas and transportation, must be sufficient to meet all expenses, whether the books are properly kept or not. Some cities, like Philadelphia, figure out a profit on their gas business by omitting to allow for taxes and interest on plant. But whatever remission of taxes or disregard of interest so takes place has to be somehow made up. The taxes on individual citizens must be increased until the losses are repaid, and under such circumstances gas may be nominally cheap and really expensive. Disregard of these obvious truths vitiates almost all the statistics on this subject,

and both Mr. Grout and Mr. Foote are occasionally misled by imperfect data. Mr. Grout, following Mr. Albert Shaw, omits an item of some 221,000,000 francs from the capitalization of the Paris gas company; but Mr. Foote, triumphantly exposing this error, appears to have fallen into another by including contributions to a sinking fund under the head of dividends.

In the case of Philadelphia, it is difficult to resist Mr. Foote's conclusion that the actual cost of gas to the citizens is $1.479 per 1,000 feet, although they nominally pay but $1. To this Mr. Grout has no answer to make, except one that cuts the ground from under his own feet. He admits that the city government has the matter in its own hands, and explains its failure to manage better as due to corrupt influences. It is obvious that these influences are a constantly acting cause, and unless this cause can be removed our municipal governments are not likely to give us good businesslike administration. As Mr. Foote says, "If the Government is not strong enough nor wise enough to regulate and supervise the business of a monopoly properly, it is not strong nor wise enough to own and operate the business of a monopoly economically." It is absurd to say, as Mr. Grout does, that corporations are the cause of misgovernment. The bad character of the men chosen by the people as their representatives is the cause, and all schemes to improve our government that do not make allowance for this fact will prove futile.

In addition to their liability to political influences, industrial enterprises conducted by Government must necessarily be carried on without the stimulus to efficiency and economy furnished by the desire of making a profit. Every private enterprise must either fail or return a profit on the capital invested. Hence the persons engaged in it are constantly on the alert to improve their methods and to diminish their expenses. If they do not give their attention to this, they will presently find themselves deprived of their occupation and their wealth. But as all governmental undertakings must be carried on under legislative direction, the employees are prevented from introducing that elasticity which is essential to success in modern business. Nor have they any particular inducement to labor for economy. Their compensation does not depend on the profitableness of the service which they render. The public business goes on without interruption, although it may be evidently a losing business, and it would be unjust to punish public officers for results due not so much to their lack of ability and zeal as to difficulties inherent in the system of carrying on business under legislative direction.

The subject touched upon by Messrs. Grout and Foote is a very broad one, and it is quite evident that it will arouse very earnest discussion. We have merely glanced at some of its aspects for the purpose of directing attention to the fact that the principles determining municipal policy are the elementary and fundamental principles of government and of human nature. Comparisons of statistical returns, as at present made, are as confusing as the evidence of expert witnesses under our present system of employing them *ex parte*. Before we can judge of the success of municipalities, either in this country or in others, in carrying on their public works, we need to have their accounts and reports examined by competent auditors. If *Municipal Affairs* will promote examinations of this kind, it will render the cause of good municipal government much service.

TITLES.

Arkansas is probably the last place in the world where one would have expected to find evidences of a movement to restrict the use of titles. Hence, the mere fact that the State teachers' convention at Little Rock has raised the question of the right of those other than teachers in colleges and universities to the title of "Professor," and has decided it in the negative, cannot but be regarded as significant. The decision itself is not very important, for the limitation laid down in it is so generous and elastic that it would take in almost every one known among his friends as a professor; but the fact that the question raises a doubt in Arkansas, and calls for consideration, is an indication that the whole American way of looking at titles is changing.

There was a time, not so very long ago either, when it was hard to say whether titles in this country were looked upon seriously at all. There was practically a voluntary system of titles, under which, if a man chose to call himself, or was called by his friends, Professor, Colonel, Captain, Major, or Commodore, he became entitled to rank socially as such, and to question his right would have been an impertinence, tending in many parts of the country, not merely to a breach of the peace, but to murder. All foreign critics and social caricaturists noticed this peculiarity and made great fun of it. Was it not the gallant Colonel Diver who published the daily *Sewer*, which used to give an account in extras of the horsewhippings of which he was the victim? But did we ourselves take these titles seriously? We doubt it. We knew that they were not real, but, at the same time, we half expected visitors to enter into the spirit of our little social deception, and were rather surprised when they failed to do so. We were prone to attribute their failure to the dulness common among foreigners, especially in the case of the English.

One reason which made it difficult for them to appreciate our system was that it existed nowhere else. In every other country titles were regarded as serious matters, and always had been. Even in France under the first Republic, when titles of nobility were abolished and Frenchmen and Frenchwomen called each other "Citizen" and "Citizeness," they did not introduce a new voluntary system; they did not call each other by militia, or marine, or educational titles. The American system was the first of its kind in the world, and, while it lasted, seemed admirably adapted to our circumstances. The trouble was that our circumstances changed. Steam and the telegraph brought us into close relations with all the other countries in the world, and, just as this had an effect on alienating us from dearly loved old institutions like slavery, so it affected our attachment to our own title system.

The historical method must be applied without fear or favor, and not even patriotism will permit us to doubt that the old American voluntary system of titles is disappearing, as it comes more and more into conflict with the European systems. Is there anything to take its place except some real system like theirs, but based on our actual life and manners? Some such real system the Arkansas teachers must have had in mind.

What that system will be, when completely evolved and perfected, it would be foolish to attempt to predict, but there are many things which it will certainly not be. It will not, for instance, be English, because English titles are mainly hereditary; and so deeply rooted in the English mind is the worship of family, ancestry, and breeding that in England a title obtained by inheritance is more valued than a title obtained by merit—perhaps because anybody may get a title by merit, but nobody in the world but the Duke of Norfolk's son can be the Duke of Norfolk. Military and naval titles come next, and last of all come the educational titles so much affected in Germany and with us. An Englishman does not think much of teaching, and many an English professor prefers to see "Esq." after his name rather than "Prof." before it.

In France, under the Republic, hereditary titles have been again abolished, but those who are in the "swim" and in the "know" are very careful to keep up the traditions of hereditary France. On the Faubourg, a duke is still a duke, and there are really in France two systems of titles, one that of the old world and one that of the existing official régime. But, strangely enough, the old is socially still the more real of the two. We cannot import anything of the sort into this country.

In Germany there is an hereditary system and a military system (there is, of course, a military system in every country), and a system in which the title is derived from the occupation or station or position. The first is so elaborate that nobody can safely address a letter to a person of good birth and inherited title in Germany without getting the assistance of a German in his "set." The last is, to a foreigner, very complicated. To call a professor's wife "Professorin" seems, to our ideas, a singular custom, and the various titles connected with civil functions are very complicated. The German system is not for us.

If we were to hazard a guess, we should say that in the end the idea which is evidently at the bottom of the Arkansas attempt at classification would be most likely to triumph; that is, that nothing but real titles—*i. e.*, titles conferred by some one or some body held in respect—would survive. This is the exact opposite of the old voluntary system, under which any one took what title he pleased, and which is more or less in vogue now. Political and professional titles, like Governor, Senator, or Judge, may stick to a man after he is out of office, and even for life, but there is nothing to oblige him or any one else to use them, and they have some reality behind them. Hereditary titles do not and cannot exist; military and naval titles are generally real now, when there are any; and "Professor" will, we fancy, in time be limited more and more to those who get it by holding known positions in the world of education. On the whole, we are lucky to be free of many of the questions about titles which complicate life in Europe so much. Certainly we are not oppressed as yet by them.

GEORGE MARTIN LANE.

In the death of Prof. Lane in Cambridge on Wednesday, June 30, Harvard loses one of her oldest and most loyal sons, the last of the great teachers whose term of service began in the middle of the century. George Martin Lane was born in Charlestown, Mass., in 1823, on December 24 (the birthday, as he was wont to remark, of the Emperor Galba), and graduated from Harvard College in the class of 1846. After graduation he gave some instruction in Latin in the college, and then went to Göttingen, where he received the degree of Ph.D. in 1851. His doctor's thesis, entitled *Smyrnacorum res gestae et antiquitates*, still remains an authority, and is cited as such in the latest German handbooks on ancient history and geography. In the same year he was appointed University professor of Latin in Harvard College, became Pope professor in 1869, and resigned in 1894, receiving the degree of LL.D. and the title of emeritus professor. He was thus engaged in the active duties of his profession for more than forty-three years, and even after his retirement he gave valuable instruction to the most advanced students of the classics in the Graduate School.

As a teacher, Prof. Lane had all that fine literary appreciation which characterizes the English school, combined, however, with the minute and exact knowledge of the Germans. Besides his never-failing good nature, he had two gifts which, perhaps more than any others, awoke the admiration of his undergraduate pupils—his prodigious memory and his great originality of thought. He seemed familiar with every literature, and apposite quotations from the most various sources, now drawn, maybe, from the New England Primer, and now from the greatest of the classics, were made to illuminate the passage under discussion. The atmosphere of his class-room was thus distinctly literary, and his teaching had none of that deadly dulness which is too often the product of German learning. It was seasoned, too, with his own peculiar wit, of which so many legends come rising to the mind of every Harvard man. But it never degenerated into literary twaddle, and nobody hated looseness of method and inexactness of statement more than he. To his originality many scholars widely scattered over the land can bear testimony, recalling that it was he who first showed them that there were things to be learned that were not to be found set down in any book—that he initiated them, in fact, into the modern methods of individual research, and taught them to seek the truth for themselves. He rarely wasted time in putting questions which could be answered offhand; he never hesitated to suggest problems which nobody present, not even himself, could solve. He made it clear that there were vast untrodden fields on every side, and tempted his pupils on to exploration.

The originality which Prof. Lane displayed in his teaching was preëminent, too, in his character as a scholar. Although he was perfectly familiar with the modern literature of his subjects, and kept up to the last his acquaintance with the most recent authorities, American and foreign, yet it was evident that he made unto himself no idols. *Nullius addictus iurare in verba magistri*, his reading in the classics was so wide and intelligent, and he had pondered upon them so long and deeply, that he was thoroughly permeated with their modes of expression as well as with their thought and spirit. Besides this fundamental, he had the keenest critical acumen, so that his colleagues and correspondents accepted his dicta (modestly expressed, as they always were) like the deliverances of an oracle. He was known for his free and ready communication of the results of his studies, and a timely word from him has saved many a scholar from the publication of mistaken theories or ill-digested views. It is owing, too, to his teaching and reputation, probably more than to any other factor, that the schools and colleges of this country have shaken off the barbarian "English pronunciation" of the Latin tongue. A still greater gift to scholarship at large was his generous coöperation in the production of Harper's Latin lexicons, the second of which was dedicated to him by his friend, the grateful editor. Prof. Lane read over and corrected a great part of the large lexicon in proof; of his assistance on the School lexicon (by far the more original and trustworthy book) Dr. Lewis writes in his preface that "if it shall be found, within its prescribed limits, to have attained in any degree that fulness, that minute accuracy, and that correspondence with the ripest scholarship and the most perfect methods of instruction which are its aims, the result is largely due to his [Prof. Lane's] counsel and assistance."

Regret has often been expressed that Prof. Lane published so little under his own name, and regret was deepened when one read, at rare intervals, some printed word of his in elucidation of a difficulty or in emendation of a corrupt passage, and appreciated the skilful and convincing manner in which the thing was done. All who have sat under him know that he was very happy in the art of emendation; and those who have been vouchsafed a look at his favorite texts of the authors, cannot but feel that a rich crop of marginalia might be gleaned from them. But it was for a work of a different sort that his friends and the friends of classical education had long been looking to him—for his Latin grammar. There is no doubt that the delay in the publication of this book was due to the author's vast knowledge, increasing with his years, of the subject on which he was engaged. This, together with his horror of inexactness and of the preaching of false doctrine, led him to turn his stylus so often, and to correct and amplify so much in obedience to new discoveries in phonetics and in syntax, that as a result he no longer lives to see his book appear. It is good to know, however, that his labors are not wasted; for the work, long in type, is to be, we understand, a posthumous publication. Thus, even in the future, his teaching will continue as unselfishly as in the past.

This was, indeed, a great teacher and scholar, but by no means one of those who confine themselves for ever to the austere retreat of wisdom. He threw off the mantle as easily as he had worn it in the professor's chair. His broad, general culture, his geniality, and his never-failing politeness and *savoir-faire* made him a delightful companion. A walk with him in the college yard or in the streets of Cambridge was a unique experience in its kind. Nothing escaped his observation, and his knowledge of the history of both town and gown was almost as remarkable in its minutiæ as his knowledge of Latin itself. A good-sized book might easily have been filled with the anecdotes which he alone could tell to perfection. He knew or had known everybody who was worth knowing (and many who were not); wherever he went he was a welcome and respected guest; but above all he was *intus domique praestantior*. Where his friendship was once given, it was loyal and never swerving, and no man had warmer and more devoted friends than he. He was renowned for his wit and humor, even from those early days of "Clover Den" wherein he lived with Whitney, Winlock, and Gould—the den which saw the legendary Roman dinner, in the days when he wrote the famous ballad of the "Lone Fishball." But inimitable as he was in the hour of mirth, he was acquainted, too, with sorrow; and his own deep afflictions, borne like a brave man, had taught him to be a gentle and tender sympathizer with the sick or the bereaved. Thus, after a useful life, in an honored old age, a loving and beloved friend, he has gone—a master after whom many a voice cries out the due "Si placeo, tuum est."

IN BOSNIA.

JUNE, 1897.

"And where *is* Bosnia?" This is the ques-

tion which greets the traveller on his return from that far-away province. Geographically speaking, Bosnia lies between latitude 42° 30′ and 45° 15′ north, and longitude 16° and 21° east. But to him whose memory is full of visions of lofty mountains, of wild and picturesque valleys, of tall, white minarets and snowy domes, of streets gay with turbans and haunted by mysteriously veiled females, such an answer seems inexpressive and inadequate. Bosnia? It lies in the sunshine, it is where skies are blue, and costumes bright; and you reach it by a journey which grows constantly more interesting and delightful, even when one is weary and hungry and sleepy after the long thirty-six hours' ride from Vienna.

M. Guillaume Capus, writing in *Le Tour du Monde*, prefaces his articles with this quotation from Roqueplan: "Description teaches nothing to those who have not seen, and disarranges the impressions of those who have." Nevertheless, M. Capus takes heart of grace, and in some six long and interesting numbers describes his visit to Bosnia and Herzegovina. Not being M. Capus, the present writer has the audacity only to present a few of the impressions received during a month's sojourn in that far-away region, and asks kind indulgence for an enthusiasm (perhaps too great) over this first glimpse of the Orient, this first taste of the East lying at the very gate of the West, and held so firmly just now in Austria's grasp.

The history of Bosnia is a long one, dating to the early centuries before Christ. Ruins and bridges of the period of Roman occupation are still found, and many curious relics are preserved in the Government museum at Serayevo. In 1389 the country fell under the sway of the Turks, and passed through many vicissitudes. In 1697 the army of Prince Eugene invested the capital city, Serayevo, and many memories connected with that war centre here. By the treaty of 1878, the two provinces of Bosnia and Herzegovina, at that time belonging to Turkey, were placed under the *protection* of Austria. "Under its heel," we might add, when the army officers say, so proudly, "The Turks? They cannot so much as move a stone in the road without our consent!" But, at all events, the heel, which certainly is of iron, is softly shod, for in many ways the Austrians do well and kindly by their vassals. It is true that one must not speak lightly of the powers above; an unwise or hasty word may be followed by swift disappearance and imprisonment. One cannot forget that the sway is military when the traveller is challenged at his entrance into or exit from the railway stations. But, often, one loses sight of all this, and thinks only of the hundred improvements and conveniences, and the paternal interest of the Government, which have characterized the Austrian rule.

Leaving Vienna early one morning, by eleven o'clock the following day one is in Serayevo, the capital of Bosnia. From the dawning of that second day all is novelty and charm. Through wild and beautiful scenery, past Doboi and Maglai and under the frowning fortress of Vranduk, the train speeds on. Mists are rising from behind the lofty rocks on which stands this fortress of Vranduk. The streets in the little town are so steep that mothers are wont to tie their children fast, lest they slip down its perilous ways. And now at the railroad stations, as the train stops, come graceful young girls in Turkish costume, bearing trays of coffee in dainty cups, and surely never nectar was more welcome than this sweet, strong beverage, after our weary night of travel. One sees also the tiny water-mills, which are equal to the small amount of work required for each little farm. There are, too, the steep-roofed houses, and everywhere the strange and picturesque costumes. The mountains about Serayevo are very beautiful, rising one behind the other, till ten ranges can be distinguished as one stands on a hill overlooking the city.

We alight at the railroad station, and are soon driving through the streets. The town fairly bristles with minarets, slender and white, which give an Oriental air to the place, and are in perfect harmony with the turbaned or closely veiled Turks, men and women, who throng the streets. The charm of a first walk is great. In the town itself Austrian improvements are everywhere, but as one wanders up the steep hill-sides, over the rough and stony paths, on all hands is food for pencil and brush. Hark! the tinkle of bells, as a poor, overladen donkey or horse toils up the hill, often so heavily laden that a mow of hay seems moving itself, and it is only later that one sees the patient legs beneath. Then a group of women in dark green robes, with boots of brilliant yellow leather, and white veils closely enshrouding head and shoulders, pass you by. Through slits in these veils, dark and curious eyes peer at you, and sometimes one less timid than her neighbor will come up and give you a friendly pat. One feels that beauty must be hidden beneath, but an occasional accidental glimpse proves the fallacy of such a general impression. Some lovely faces there are, however, among the young girls, whom custom permits to walk out only partially veiled. Here is a little maiden bearing on her head a plank full of loaves of unbaked bread. She is on her way to the baker's, where they will soon be ready for her again.

As in other lands, curiosity is rife over the artist at work, and a group of critics gathers beside the painter. "Dobra, dobra," they pronounce it, in approval, and point out to each other whatever strikes their fancy in the picture. But one and all refuse to pose, and the effort to secure a sketch "on the wing" may result most disastrously for the poor artist. Laying down palette, canvas, and brushes to get from the paint-box some necessary pigment, with lightning rapidity the bare hand of the little maid may wipe out the sketch; and up the steep, stony street, her high-heeled wooden slippers clattering gayly and her merry laughter ringing out, may flee the unwilling model herself.

These dark-clothed, white-veiled women, leading their children by the hand and carrying their house-key with them, are great visitors, and seem to have happy times of their own, though one cannot but wonder what is their talk, and what their joys and sorrows. The mode in Serayevo known as the Damascus style is more curious than beautiful. Bosnian ladies who affect the latest fashion appear in full skirt and a shorter overskirt which they turn up over their heads, while the face is covered with a thin handkerchief of gay color and commonly of a large flower pattern, so thin that they can see and breathe through it, but so good a disguise on account of its floral pattern (of which a large rose or chrysanthemum is usually just over the nose) that they are completely veiled.

Serayevo is rich in mosques, some large and in good repair, others neglected and deserted; more than a hundred minarets rise from the town. There seem to be two styles of building; some mosques have the tall, white minarets and domes, others are of gray shingle, with octagonal minarets and the front adorned with color and with inscriptions from the Koran. The largest and finest is the Begova Dzamia, near the market. A beautiful old lime tree shades a fountain in the court-yard, and here one finds the curious standard of measurement, a long stone on which the true "arshin" is marked. Hither, from the market, come any disputants as to the measurement of purchased goods, and from it there is no appeal. Among so many it is hard to choose one mosque rather than another for description. All are interesting; that of the "Seven Brothers" one remembers by the seven green turbans placed at the head of as many benches in a little side addition to the mosque.

Another picture is stamped upon the memory: a still, clear night, the moon at the full, yet with a brilliancy of stars as well, the dark mountain ranges silhouetted against the sky, seeming ready to topple over upon us. Up the steep, steep streets we go, through the almost painful silence, now a snowy minaret gleaming on our right, now another at the foot of some dark, narrow by-way glinting out upon our left; beside the mosque a lonely Turkish graveyard, with its stone turbans marking the resting-place of the men, and its larger shrines for the saints. The women, whose souls are a questionable, uncertain thing in the Turkish mind, are marked by a smaller, simpler stone. Within this mosque, on Thursday nights, may be seen the curious dance of the dervishes, who work themselves up gradually into a perfect frenzy, or the quieter prayers and prostrations of ordinary worshippers.

Of these mental photographs, which are a lasting possession, we recall that of the pilgrims returning from Mecca. To see Mecca and die, if need be, is, to the Turk, the highest ambition, the loftiest aim. Old, old men, who have dreamed of it for years, spend the savings of those years and the last strength of life in attaining this coveted distinction. The Austrian Government interests itself, and does much to further the pilgrimage by reducing railway fares, but a large part of the journey must be made by sea, and many who start do not live to return. The streets are crowded with those ready to welcome the returning pilgrims. Around the beautiful Ali-Pasha Mosque, beneath the trees, is a perfect wealth of color, in fez and turban, sash and jacket. At the railway station all is life and bustle. Far away, along the horizon, lie the blue mountains, with flitting cloud shadows checkering their slopes. At last the ringing of the bell, and all press forward to greet the pilgrims. Almost before the train stops and the doors are flung open, they are seizing and embracing their dear ones. Travel-stained and dusty, worn and weary, some almost dead, they come forth and are welcomed with a truly Oriental effusiveness. Kissed on cheeks and shoulders, handed from one to another of the glad welcomers, they go with a look of happiness and content, satisfied at last. Now death may come when it will; they wear the green

scarf of the hadji from shoulder to waist, and henceforth life can hold nothing more to hope for or attain. The Austrian burgomaster makes them an address of welcome, and they repair to the Ali-Pasha Mosque for a thanksgiving, and then turn homewards. Their womankind are all abroad too, but hold themselves aloof and do not mingle with the men. So home and to sleep.

The Turk loves beautiful scenery; he loves, too, the sound of running water. Many of the little cafés and restaurants have balconies overhanging a swiftly flowing stream, where he can sit and smoke and drink Turkish coffee from zarfs to his soul's content. On the steep slopes around Serayevo, at sunset, you may see these same Turks by the score, their picturesque figures outlined against the glowing sky, simply wrapt in contemplation of the beautiful scene. In the bazaar all is color and motion. From the country afar about Serayevo come the peasants. It is the only mart of all that region, and, rather than miss coming, they would bring their produce to an uncertain market in preference to selling it at home when the chance offers. Here is the street of the tailors, where they sit cross-legged at work, here the coppersmiths' street, where sound of clanging hammer smites deafeningly on the ear, and where the graceful ibreeks, or pitchers, the dainty zarfs or coffee-cups, and the quaint, cylindrical mills, are for sale. There is a merchant with his store of pottery, and here a man who sells fez caps, and fits them on a hot block "while you wait." Here, too, are the brooches and penhandles and various articles of beautiful silver and black inlaid work peculiar to this region. The umbrella balls and handles are especially attractive, but bargains are hard to make where no European tongue avails. The Austrian Government has industrial schools and factories where the highest standard of excellence in rug-making and metal-work is maintained, but, for the traveller, the purely native work has a greater interest. The writer bears eternal gratitude to a clever little Jew, a boy speaking German and Bosnian as well, who attached himself to her, and who acted cheerfully as interpreter in her rambles. Seated in one of the market booths, taking a rapid sketch of the Latiner-Brück and the kaleidoscopic stream of passers-by, little David beside her, but more within the booth, kept shooting out his head, like a tortoise from its shell, and crying, "There, quick, a priest, take him! Ah! now, a veiled lady—put her in! Oh, see, a Turk in scarlet fez is coming; oh, quick, my lady, quick!"

The population of Serayevo is strangely mixed. Here one sees, side by side, the Turks, the Serbians, whose religion is that of the Greek Church, and the Jews, descendants of certain Spanish Jews who took refuge here at the time of the Inquisition, and whose graveyard, with its serried ranks of stones, overlooking the river Milyatzka, is well worth a visit, even if the lack of a knowledge of Hebrew with which to decipher the epitaphs be keenly felt. A large Roman Catholic church, a larger and more beautiful Greek church, where splendid ceremonies and impressive rites are celebrated, and a Jewish synagogue, are all here, and Serayevo presents the curious spectacle of the observance of three consecutive Sabbaths—the Mohammedan holy day, which is kept on Friday, the Jewish Sabbath, and the Sunday as known to us. A large law school is here too, and its students, in their long black robes, are often to be seen, while the building itself, overlooking the Milyatzka, with its own mosque and spacious classrooms, is most interesting.

Curious tombs one finds everywhere, neglected and almost buried under long grass in the city itself, or even on the highest parts of the mountain roads. Two we recall as especially impressive. In the foreground, the broad sweep of the Austrian military road; below, deep ravines; and, across the gulf, huge bare mountains whose lines of massive simplicity form a background of unusual grandeur; by the wayside, two tombs, lonely, mysterious. Here they stand, like sentinels guarding the defile, or, rather, like relics of a bygone time, witnesses of a past full of strange stories and stranger suggestions. So we take farewell of the beautiful town, which is constantly becoming more modern and more Austrian, rejoicing in all improvements which may tend to the elevation and uplifting of its people, but with an artist's joy in all that still remains of the picturesque and Oriental in its streets and by-ways. PHEBE DAVIS NATT.

PARIS UNDER THE REGENCY,

PARIS, June 17, 1897.

M. Alfred Franklin is the administrator of our Mazarine Library. He may be ranked among the polygraphs of our day. He has edited a splendid reproduction of the famous engravings of Tortoral and Perissin, relating to the incidents of the wars of religion in France (the original copies of these engravings, which are valuable historical documents, are extremely rare), and in his edition there are notes and commentaries by various writers on each engraving. M. Franklin has also published a 'Genealogical History of the Sovereigns of France from the Time of Hugues Capet.' He has made many contributions to the Bulletin of the Society for the History of Paris. His latest publication is a series of volumes under the title "La Vie privée d'autrefois." The first series embraces no less than twenty volumes. A new series is just beginning, which has for its sub-title, "Modes, mœurs, usages des Parisiens du 12e au 18e Siècle." The first volume has for its subject life in Paris under the Regency. M. Franklin is not the author of the volume; he has translated the work of a German written at the time, but he has somewhat abridged it, and has added many interesting notes to the narrative.

Joachim Christopher Nemeitz was privy-councillor of the Prince of Waldeck. He had made it a specialty to accompany young princes on their travels, and he spent two years in Paris. He published in 1718 a curious description of life in this capital which rapidly reached a second edition; in 1727, there appeared in Leyden a French translation of it with this title:

"Séjour de Paris: c'est à dire Instructions fidèles pour les voyageurs de condition, comment ils se doivent conduire, s'il veulent faire un bon usage de leur tems et argent durant leur séjour à Paris—Comme aussi une Description suffisante de la Cour de France, du Parlement, de l'Université, des Académies et Bibliothèques; avec une liste des plus célèbres savants, artisans, et autres choses remarquables qu'on trouve dans cette grande et fameuse ville."

The translator is unknown, but he was very imperfectly acquainted with the French language, and M. Franklin had often to correct his mistakes.

Nemeitz supposes a foreigner arriving in Paris either in an ordinary chariot or with post-horses. The chariot lands him in the customary inn, where he is sure to find rooms. The gentleman who has travelled with post-horses "is sure to have made friends during the journey with the master postilion, who has given him information on the subject of the best hotels." There are several commendable ones in the Faubourg St.-Germain, which was at the time "the rendezvous of foreigners." The "Comédie" was in this faubourg, as well as the "foire St.-Germain"; the Opéra, then in the Faubourg St.-Honoré, was not far off on the other side of the river, and you could cross the Seine in a boat (there was no bridge then between the Pont Neuf and the Pont Royal). The garden of the Luxembourg was a great attraction. The faubourg was full of the finest private hotels, inhabited by the nobility. The most fashionable hotel for travellers and foreigners was the Hôtel d'Antragues, in the Rue de Seine: "You see there only bishops, foreign princes, and great lords. I will cite a few others: The Hôtel de Tréville, often inhabited by ambassadors; the Hôtel Impérial, Rue du Four; the Hôtel de Hambourg, close by the Hôtel d'Espagne, Rue de Seine; the Hôtel de Nîmes, in the same street; the Hôtel d'Anjou, in the Rue Dauphine; the Ville de Hambourg, in the Rue Mazarine; the Hôtel de Modène, Rue Jacob." The people living in one of these hotels formed a sort of little republic, and could not escape entering into relations with each other.

"The society of honest Frenchmen," says Nemeitz, "especially if they are people of condition, is very agreeable and very profitable. You get exercised in the language, and you insensibly take on their manners, and they can procure you good acquaintances. Little is gained in conversation with one's compatriots or with other foreigners, as these people have come to Paris with the same view as yourself—to learn; and then, you will have plenty of time to talk to them when you return to your country."

He observes elsewhere that the French are very indulgent of mistakes made by a foreigner in speaking the French language, and are always pleased to help them and correct them. This is as true now as ever it was, and I have often observed it, particularly in French shops. A foreigner is never laughed at or made ridiculous on account of his mistakes in speaking.

"The sciences," continues Nemeitz, "which a man of quality must learn in Paris, are the French language, mathematics, and drawing. With whatever facility and purity people may think, out of France, that they speak French, they will, on arriving, experience a great disillusion. It is only in the country itself that you can learn the accent, and that only with much pains and much time. It is a pity to hear Germans pronounce *couferneur* for *gouverneur*, *boison* for *poison*, *tendelle* for *dentelle*."

It is, therefore, necessary to take a French master on arriving, a man with a delicate accent, who knows how to write a letter promptly. It is rather singular to read in a sort of guide-book: "Mathematics is the second acquirement which a man of quality ought to possess." If he is a soldier, he is advised to learn the art of fortifications. Nemeitz counts also among the mathematical sciences the art of drawing, even vocal and instrumental music.

"Music gives the entrée to the great

world. . . . There are here excellent masters for all sorts of instruments, and I doubt if anywhere else can be found so many capital teachers. I know more than thirty composers who have made themselves famous in their art. Whoever hears the music in the King's chapel on the great feast-days must confess that nothing finer or more perfect can exist. The instruments which are now preferred in Paris are the harpsichord (*clavecin*) and the German flute."

The young man of quality must take lessons in dancing, fencing, and riding. There were at the time four riding-schools, or academies, as they were called. One of them was under M. de la Guérinière, who published the finest work on French riding, with beautiful illustrations, one of the most valued books on the veterinary art.

Nemeitz forgets nothing, and has an important chapter on dress—"Comment il se faut habiller," etc.; he has another on the subject of servants—"Si on doit prendre pour valet un français." His opinion is that it is better to take a Frenchman, if only for the lessons in French which he will give you. He answers for the fidelity of French servants.

"There are instances of servants having abandoned or robbed their masters, and a stranger has the same right as a Frenchman to have his servant arrested, even for the theft of a trifle. The judges of Paris make no great ceremony on this point, and the man who has stolen to-day can be hanged to-morrow. The French valets, besides, are prompt, clever, good for everything. I think that they would go through fire for the love of their master. They love him, respect him, take good care of his clothes. If the master has a quarrel they don't desert him, but risk their lives for him. Yet they are to the last degree intent on their own interest; it is their great defect, which all have more or less. They don't steal, but they levy a tax upon everything. . . . A valet costs one franc or twenty-five sous a day, and with that he feeds and clothes himself."

The notice of the French Theatre is interesting. The "Comédiens du Roi," as they were called, received no subvention from the King (the Comédie-Française in our day receives one). "They have no Director [there is now one, called Administrator, appointed by the State], they share the receipts every night; one receives a whole portion, another a half, others a fourth, an eighth, a sixteenth, according to their capacity and to the part they have played." Something of the same kind exists now, but the division is only made from time to time. After the death of Louis XIV., the Regent authorized the Italian comedians to reopen their theatre in the Hôtel de Bourgogne, which had been shut twenty years before because of the great freedom of its plays and its criticisms. This troupe was called the "Italian Troupe of his Royal Highness the Duke d'Orléans." The third theatre in Paris was the Opéra, where the lyric operas of Lulli were the chief attraction of the time. As in our day, "the persons belonging to the opera—singers, dancers, players of instruments—formed a little republic composed of about two hundred persons." The Opéra was at the Palais Royal.

Three theatres only were then in existence, and were thought sufficient for the amusement of the capital. The prudent Nemeitz says that "strangers ought to take care not to make acquaintance with the ladies of the opera or of the Comédie. Nearly all those who have a little beauty are kept by illustrious and wealthy seigneurs; even a few by dukes and peers." At the Comédie-Française, "a man of quality occupies a box in the first tier or in the parterre, seldom in the boxes of the second tier, which are assigned to the bourgeois; never in the amphitheatre, where all the *racaille* flock. At the Opéra, the amphitheatre is honorable in the same degree as the boxes of the first tier." The Duchesse du Maine gave, from time to time, representations in her private theatre at Sceaux. It was a great honor to be invited. The Duchess and her guests used to play themselves. She was the granddaughter of the Grand Condé, and was married to the Duke du Maine, a son of Louis XIV. and of Madame de Montespan.

Nemeitz has much to say about the cafés of Paris. "It is," he says, "a general habit in Paris to take a cup of coffee after dinner. I do not know if this beverage is very healthy." Madame de Sévigné did not much believe in it, and said, "Le goût en passera comme du café," speaking of Racine, to whom she preferred Voltaire. Madame de Sévigné was wrong; we still read Racine and we still take our coffee. Nemeitz, curiously, thought that it was a cure for melancholia, "as was the opinion," he says, "of a certain lady who, hearing that her husband had been killed in the wars, exclaimed: 'Ah! how unhappy I am! Quick! quick! bring me my coffee!'" There was, in the time of the Regency, an infinite number of cafés in Paris, as many as ten, twelve, sometimes more, in the same street. They were frequented by the greatest gentlemen and even by princes. People were allowed to enter them without spending anything, as is now the fashion in Italy. They smoked little in the cafés, "as there are in France very few people of quality who like to smoke." No papers were found in them; these were read in the circulating libraries.

The extracts which I have given show that 'Life in Paris under the Regency' is no common guide-book. It is a document, not without value, regarding life and manners in Paris, at an interesting period of history, faithfully written, by a German witness who evidently took great interest in his subject and had no prejudices of any sort.

Notes.

To obtain material for a graduate seminary in rhetoric, Prof. F. N. Scott, of the University of Michigan, has begun a systematic collection of specimens of student composition. He would like the help and coöperation of teachers of English in all parts of the country, and offers to send a circular of instructions to any one who may care to apply for it.

The Century Co. will shortly issue 'An Artist's Letters from Japan,' by John La Farge, with the author's illustrations, and have in preparation Mr. James Bryce's 'Impressions of South Africa,' an enlargement of his sample chapters in the *Century*, and Rudyard Kipling's 'Captains Courageous.'

Du Maurier's 'The Martian,' which comes to an end in the current *Harper's*, is on the eve of publication in book form.

The Putnams announce 'Impressions of Turkey,' by Prof. W. M. Ramsay of Aberdeen.

Richard Malcolm Johnston's 'Old Times in Middle Georgia,' a volume of sketches, will be issued by Macmillan Co., together with 'An Outline for the Study of City Government,' by Delos H. Wilcox.

Messrs. Scribner will publish in this country 'Later Renaissance Architecture in England,' edited in six parts with 156 plates by John Belcher and Mervyn E. Macartney.

D. Appleton & Co. are the American publishers of 'The Outgoing Turk,' reviewed by us last week.

'Sketches Awheel in Modern Iberia' is the title of a copiously illustrated book by Fanny Bullock Workman and William Hunter Workman (Putnams). A great deal of the text is taken up with details about bicycle accidents and incidents that may interest wheelmen, but cause other readers to turn the leaves rapidly. Bicycles are not yet very common in Spain, as these riders found to their cost; they were constantly frightening animals and angering their owners; in one case (p. 73) a murderous assault by a drunken driver was narrowly averted. The writers comment on the noisiness of Spanish towns, the badness of country roads, the beauties of the scenery, and so forth, but there is no new *aperçu*, hardly a sentence to show cause why this book should have been written except as a diary for the authors' own delectation. The guide-books are, however, brought up to date in one respect. Toledo, we are informed, has at last a hotel fit to stay in. We are also told that bull-fights are still popular in Spain. Postal affairs do not seem to have improved at all. The writers mailed from Granada seven small articles to the post in other countries, and only one of them reached its destination; and this was but a sample of their experiences.

Violin players will find entertainment and some incidental instruction in 'Famous Violinists and Fine Violins,' by Dr. T. L. Phipson (Chatto & Windus). It contains many anecdotes and historic details that are familiar, together with some that are less hackneyed. There are chapters on Cherubini, Paganini, Balfe, De Bériot, Ole Bull, "The Soul of the Violin; or, the Secret of the Sound-post," etc., etc. In a chapter entitled "The Orchestra and the Singer," Mr. Phipson harps on the old complaint that solo singers get a hundred dollars or more where an orchestral player gets only one. He thinks this should be remedied, but he forgets some hard facts. Great singers, like popular writers, may get more than they are worth intrinsically, but it is a purely commercial question. If a manager finds he can draw a $10,000 house by engaging certain "stars," and only $1,000 without them, it pays him to give them $1,500 apiece. Such singers are expensive because they are scarce, whereas orchestral players are overabundant. If they get $7 for an evening's work, that is as much as most of them are worth. Few of these players are real artists. There are thousands of journalists who work for $7 a day, though they may be greater literary artists than these men are musical artists. The latter cannot play artistically unless they have a great leader to conduct them; and it may be added that if there is any injustice in the present arrangement it is in the conductor's receiving so much less than the singers. Just at present, for instance, Wagner's operas are drawing larger houses in London than they ever did, largely because Mr. Seidl conducts them; yet he probably receives only one-fifth as much as some of the singers.

Mr. J. A. Joseph's 'Institutional History of the United States' (Danville: Indiana Publishing Company) has evidently been written

with such excellent intentions that we can but regret our entire inability to see any useful purpose that the book is likely to serve. "Institutional history" is a somewhat vague term at best; to Mr. Joseph it seems to mean, in this instance, 375 pages of assorted information, for the most part accurate enough, on various phases of American history and life, together with such new and interesting facts as that the town of Plymouth developed into the colony of Massachusetts, that it takes a thousand miles of yard-wide paper to put out an edition of the New York *World*, and that while the United States "provides no special training" for its foreign ministers, they "are supposed to be chosen for their knowledge of international law, history, and the French language." We sympathize with the author in his distrust of the greenbacks, and can but admire the dexterity with which, as President of a "normal college" in Indiana, he avoids committing himself regarding either the gold standard or free coinage of silver; while with his remark that "the tariff is a good thing to be let alone by our legislators" we most heartily agree.

Most of his readers in America who know Austin Dobson only as the author of exotic and society verse of charming poetic quality, and of essays on eighteenth-century literature and art, will be surprised to see his name on the title-page of a 'Handbook of English Literature' (Longmans), which now, revised with additions by Prof. W. Hall Griffin, passes to a third edition after an interval of nearly a quarter-century since the first. The stream of such handbooks seems endless, while the perfect book on the subject remains always to be written. The want of a thoroughly critical and trustworthy manual of English authors and of English literary history, supplying a guide to the results of recent researches in this field, indeed is often felt, although the recently revised edition of Mr. Stopford Brooke's 'Primer' fills the need for a succinct and well-proportioned elementary introduction to the subject as well, perhaps, as this generation can demand or expect. It is difficult, however, to see in what respect the Dobson-Griffin compilation is an improvement over its competitors in the field. It offers nothing new in method or treatment, while its style is singularly perfunctory, colorless, and uninspiring, and, like so many others of its class, it almost renders the study of literary history, which Gray considered in itself the most interesting subject in the world, here one of the most uninteresting. The rock on which these perpetually repeated attempts split is easily discoverable. A work of limited compass covering so large a field should either generalize its subject after the manner of the 'Primer,' and treat only of the great landmarks and masterpieces of literature, or it should frankly adopt the shorthand style and encyclopædic treatment of the German "Grundriss." Any attempt to combine the two methods can result only in the production of mere cram-books of the present type, of possible temporary utility to candidates in examinations such as those set for the English civil service, but otherwise well calculated to repel the student of healthy mind and do general harm to the cause of English studies.

The country houses of England abound with material for amplifying the published histories of the United States. From time to time the Historical Manuscripts Commission, by the diligence of the experts employed on the old documents preserved in the muniment rooms of the nobles and squires of England, bring to light most interesting old papers. Such are to be found noted in the report just issued upon some of the papers in the possession of the Duke of Portland. Among these are a few letters from William Penn. They were all addressed to Robert Harley, afterwards well known as the Earl of Oxford. It was his son who made the great collection of books and manuscripts so useful to historical students, and from whom the Harleian Society took its name. The only daughter and heiress of this son, the lady of whom the poet Prior sang, as

"My noble, lovely little Peggy,"

married William Bentinck, second Duke of Portland, and brought to his family great wealth from property in the City of London, which the Bentinck family hold to this day. It was with the Lady Margaret Harley that the same family also acquired the Harley MSS. that are now being calendared, and from which Penn's letters have been brought to light. They are preserved at Welbeck Abbey, the Duke of Portland's seat in that part of Nottinghamshire known as "the Dukeries."

The *Geographical Journal* for June opens very appropriately with Sir Clement Markham's review of the geographical history of the Queen's reign. This includes the exploration of the greater part of Africa, Australia, the north polar region, the interiors of China, Japan, Central Asia, Tibet, and Afghanistan. Progress has been least in South America, which now presents "a wider and more fruitful field for the explorer" than any other part of the world. There follows the same scholar's address at the celebration by the Royal Geographical Society of the fourth centenary of the voyage of John Cabot, 1497. It is remarkable principally for the emphasis laid on the meagreness and uncertainty of our information in regard to this voyage, and especially in regard to the landfall. This uncertainty was increased by the discussion which followed the address, in which mathematical evidence was given to show that the voyage must have taken longer than the generally accepted three months, May 3-August 5, 1497. It was suggested that Cabot sailed in 1496, and returned in August, 1497. We mention also notes on the Tripoli Hill range by Mr. H. S. Cowper, and an interesting account of the nomadic Berbers of Central Morocco by Walter B. Harris. Among them was a curious little settlement of the descendants of the renegades and Christian slaves of the time of Mulai Ismail, with the addition of stray renegades who have been sent there since. There are representatives of thirteen nationalities, including English, Flemish, and Spanish, in the three or four hundred inhabitants.

We have paid elsewhere our tribute to the memory of the late Prof. Lane of Harvard, whose death follows all too closely that of his classmate, the lamented Child. It remains to record the long service of Prof. Lane as a contributor to the *Nation*, and his constant good will outlasting his service, which was much interrupted of late years. He had an ideal capacity for the writing of "Notes." For longer efforts he seldom found leisure.

—An important contribution to our knowledge of the ancient inhabitants of the Calchaqui region, in the northwest part of the Argentine Republic, appears in the first number of the anthropological section of the 'Anales del Museo de la Plata.' The author, Prof. Ten Kate, gives an account of his visit to the Calchaqui country, and of his explorations among the ruins of their fortified towns. He describes their burial places and the peculiarities of their method of interment. The bodies of adults were usually placed in a squatting position, with the arms folded, and those of infants were deposited in stone jars. An examination of the large osteological collection now in the La Plata Museum shows that the most striking physical characteristics of this people were the brachycephalic skull and a low stature. This conclusion is at variance with M. Hamy's assertion that such peculiarities did not exist among the inhabitants of this region. Certain anatomical resemblances between these remains and those of the ancient Peruvians seem to imply that the races were closely allied, if not identical. The history of the people known as Calchaqui is still involved in great obscurity, some writers believing that they were exterminated by the Spaniards, or possibly by the Peruvians before the Spanish conquest. Ten Kate, however, concludes that the depopulation and desolation of the region were due quite as much to climatic and physical causes as to the devastations of invaders. The memoir is illustrated by cuts representing the cemeteries and by a series of admirable reproductions of photographs of the bones.

—A proof of the interest taken in the renaissance of Christian thought in French letters is furnished by the work of Father Pacheu of the Society of Jesus, 'De Dante à Verlaine,' which is a conscientious study of mysticism in literature. Father Pacheu has not read all of Verlaine's poems, but he has carefully read those which bear on the subject he treats of, and his verdict on the poet is likely to surprise many who judge Verlaine rather by the worse portion of his verse than by the sum of it. He acknowledges willingly that Verlaine was very bad, but that is no reason why he should not have repented; and the proof that he did repent he finds, not only in the fact that the poet died with a crucifix in his hands and a priest by his side, but in the character of the better portion of his work, especially in 'Sagesse.' According to Father Pacheu, true mystics are not very numerous in literature, and he cites Dante as the truest and greatest, naming also Spenser, Bunyan, and Shelley among the English. Verlaine appears to him to have come nearer Dante in true mysticism, by which he means not the vague religiosity of modern dissatisfied or posing writers, but the sincere aspiration to God and the earnest striving after a realization of the higher inner life. It is this which he finds strongly marked in Verlaine. Of course there is the desire to prove his case and to make of Verlaine a convert to the dogmas and practices of the Church of Rome, but there are points in favor of Father Pacheu's contention, and his analysis of Verlaine's state of mind, and his explanation of the shocking inconsistencies of his conduct, are more than ingenious pieces of special pleading. After Verlaine he tackles Joris-Karl

Huysmans, and brings him also into the fold through his book 'En Route.' The work, being conceived and carried out in a serious spirit and well put together, is interesting from beginning to end. It is well, too, to have the views of theologians on points such as those raised here.

—We have noted from time to time the progress of Mr. E. S. Hartland's 'Legend of Perseus,' and can now speak of the completion of this important work by the third volume (London: David Nutt). The first two volumes dealt with the supernatural birth of the hero, and the life-token or sympathetic object which indicated the hero's fate. The third volume contains the two remaining episodes—the rescue of Andromeda, and the Medusa-witch—and a chapter devoted to the story as a whole. There is also a supplementary list of works referred to, as well as an excellent index, and an appendix of tables dealing with various episodes in the legend and serving to show their geographical distribution. It is impossible in brief space to do adequate justice to Mr. Hartland's careful and interesting study of a great classical legend and its counterparts in *Märchen*, saga, and superstition. The method of treatment is the one followed by Mr. Frazer in his 'Golden Bough,' and familiar to the readers of Andrew Lang's mythological studies. Mr. Hartland's merit consists in the attractive way in which he has presented his material, and his great industry and exactness in compilation. The definite results of the investigation are inconsiderable. "The area within which the place of origin is to be sought may roughly be said to include the whole of Europe and Asia, and the parts of Africa which lie to the north and east of the Great Desert." The inquiry into the relation between the ancient and modern variants of the story ends even more vaguely, and, in the words of the author, "so far as the results of research as to one story may enable us to forecast the results of research as to others, it favors the view of those students who declare that the hope of tracking a folk-tale to its pristine home is illusory, and the attempt a waste of time." Mr. Hartland closes with a superficial reference to the bearing of his study upon the most sacred dogmas of Christianity. As he expressly disclaims any polemical motive, he might better have left the reader to make his own inferences. If he were not content with this, he should at least have treated the questions involved at length.

—Dr. Giuseppe Pitrè's great undertaking, the "Biblioteca delle Tradizioni Popolari Siciliane," which we have so often had occasion to mention in terms of the highest praise, has just been increased by the twentieth volume: 'Indovinelli, Dubbi, Scioglilingua del Popolo Siciliano' (Turin-Palermo: C. Clausen). *Indovinelli* of course are riddles, *dubbi* are a series of enigmatical questions propounded in a stanza of *ottava rima* and answered in a similar one, and *scioglilingua* or *bisticci* are a succession of words, often without connection or sense, of difficult pronunciation, like the well-known English example: "Peter Piper picked a peck of pickled peppers," etc. The editor has collected twelve hundred examples of the above classes and prefixed to them an elaborate treatise upon the Riddle. There have been many collections of riddles, and histories of this department of literature, notably Friedreich's 'Geschichte des Räthsels' (Dresden, 1860), but no one has given so exhaustive an account of this subject, or investigated so fully the question of the origin and diffusion of riddles, as Pitrè. Besides this very considerable labor, Dr. Pitrè has compared his material with all the other Italian collections and indicated the parallels and variants. The amount of work represented in the eighteen pages of "Varianti e riscontri" is enormous, and the editor may well say: "I dilettanti del genere sanno dove metter le mani per fare della erudizione a buon mercato." The work ends with a bibliography of Italian and Sicilian riddles, which furnishes some additions to the editor's 'Bibliografia delle Tradizioni Popolari in Italia' (Turin, 1894). In glancing over the collection we notice many riddles, etc., which are common to England, and it is a cause of regret that such scanty materials are to be found for purposes of comparison. Pitrè has been fortunate in living in a land where the popular literature still flourishes; but he has performed his mighty task with enormous labor and self-sacrifice, which are already repaid by the gratitude of scholars all over the world. As the monument, the greatest ever erected by one man to the popular literature of his country, approaches completion (two more volumes are announced on the popular customs and minor festivals of Sicily), we offer our congratulations on what has already been accomplished, and our hopes that the builder, more fortunate than our own Child, may be spared to see his task happily ended.

—The distinguished traveller Miss Mary Kingsley recently lectured at Mansfield College, Oxford, upon the invitation of the Hibbert trustees. Her subject was African native law and its connection with the African form of religion. The late Sir A. B. Ellis, in his well-known book, Prof. Kohler's pamphlet on negro law, and Mr. Saraban's Fanti Customary Law, were the three trustworthy printed sources of information, but there was no printed collection of cases in pure Bantu law or in pure negro law. Hence Miss Kingsley proposed, from her own detailed observation, to give a tentative account of these neglected systems. Common to them both was a general conception of religion as influencing every least act and concern of life, and a specific conviction that the native must be on working terms with the great world of spirits around him. Alike among pure negroes and pure Bantu Miss Kingsley discerned a recognized hierarchy of these spirits; in some districts more classes were distinguished than in others, but everywhere at least six orders were more or less clearly distinguishable. Among the pure negroes of the West Coast a system of so-called slavery is essential; the Bantu often follow an alternative practice of killing and eating prisoners and criminals. Bantu is more difficult than negro law, because of local variations in this and other particulars among Bantu tribes. An important institution, well developed among pure negroes, and also among slave-holding Bantu, is the House. Individual members of a House may be animate or inanimate, men, animals, or things. Dogs and canoes are, in the eye of the law, quite as capable as men of advancing the House or of embroiling it by their proceedings. A so-called King heads the House; he may be free or a slave. Often a slave-owned House will be the richest in a whole district. The law lays down (1) that the owner of a slave stands accountable for his slave's acts; (2) that the head of a House is responsible for damage done by members of the House, whether to fellow-members or to outsiders. Miss Kingsley witnessed in the Cameroons the chopping up of a criminally destructive canoe. They were "settling its palaver—one time." Among the Ouroungo the slaying of a woman was accounted for in answer to inquiry by the laconic declaration, "She make palaver—too much." The most intricate palavers arose under the law vesting ownership of children, one of whose parents was a slave, not in the free parent, but in the owner of the slave parent. There is no statute of limitation to bar the assertion of such ownership at any time; consequently claims are revived after having lain dormant so long that their existence has been forgotten. As there is no system of record to prove the satisfaction of such claims, an inextricable confusion and much injustice arise. The lecturer argued for a far greater closeness of interdependence between law and religion than has been made out by Ellis, Kohler, or Saraban, and suggested that, so far as her evidence went, it indicated a classification of human concerns with reference to their religious bearing. There are purely human affairs, such as matters of inheritance, and with these purely human spirits can deal without calling in spirits of a higher grade. There are other concerns, not apparently very different, where it is wiser to call in the higher spirits. "One charm does the work of twenty slaves" is a common saying.

JAMES'S WILL TO BELIEVE.

The Will to Believe, and Other Essays in Popular Philosophy. By William James. Longmans, Green & Co. 1897. Pp. xvii.-332.

The most profoundly sceptical and, its opponents would maintain, the most disastrously self-defeating and sophistical tendency in modern philosophy lies in the prevalent effort nowadays, in the name of God and the moral law, to subordinate intelligence to desire. Truth, it is contended, is of value simply in that it ministers to a certain spiritual craving for a definite and symmetrical scheme of the world; but the greater takes precedence of the less—the demand for a moral order in the universe and for communion with God is more fundamental, more imperious, more fraught with consequence for the best life of humanity, than the demand for truth, and any truth that presents an obstacle to it may, with no sense of comedy, by sheer volition, be set aside as wholly or at least as partly false. "I could not rest tranquilly in a truth," Mr. Bradley, for example, declares in his 'Appearance and Reality' (p. 148), "if I were compelled to regard it as hateful. While unable, that is, to deny it, I should, rightly or wrongly, insist that the inquiry was not yet closed, and that the result was but partial, and if metaphysics is to stand, it must, I think, take account of all sides of our being."

From this somewhat desperate philosophy of the world as it by hypothesis is not, with its

tacit injunction on us to do our duty cheerfully in any sphere of life excepting precisely that to which we may have been called, the doctrine that gives unity to the papers brought together in the present volume is, we understand, in spite of many expressions to the contrary, sharply to be distinguished. 'The Will to Believe, and Other Essays' is, in the main, an exposition of the claims of what we of Anglo-Saxon lineage delight to celebrate as the strenuous mood. "The deepest difference, practically, in the moral life of man," the author says, "is the difference between the easy-going and the strenuous mood"; but the strenuous mood responds to the summons of none but "the wilder passions," "the big fears, loves, and indignations," or the "deeply penetrating appeal" of the "higher fidelities," "of justice, truth, or freedom"; and responds to them, indeed, in but a very minor degree in a merely human world. "Life, to be sure, is even in such a world a genuinely ethical symphony; but it is played in the compass of a couple of poor octaves, and the infinite scale of values fails to open up"; it needs the presence of a god to unveil an "infinite perspective," to prolong incalculably "the scale of the symphony." Once take for granted his presence, and the more imperative ideals "begin to speak with an altogether new objectivity and significance, and to utter the penetrating, shattering, tragically challenging note of appeal." "Our attitude towards concrete evils is entirely different in a world where we believe there are none but finite demanders, from what it is in one where we joyously face tragedy for an infinite demander's sake. Every sort of energy and endurance, of courage and capacity for handling life's evils, is set free," Prof. James affirms, "in those who have religious faith"; but he does not therefore in the least on that ground contend that, whatever the evidence to the contrary, religious faith must be true. He at the utmost suggests that, even if false, it would be, like the foundation of many another noble and ennobling loyalty, a beneficent error. "The capacity of the strenuous mood lies so deep down among our natural human possibilities that, even if there were no metaphysical or traditional grounds for believing in a God, men would postulate one simply as a pretext for living hard, and getting out of the game of existence its keenest possibilities of zest"; and he suggests this merely by the way. If he rejects the closed circle of cause and effect, the block world of modern science with its exclusion of spontaneity, of fresh beginnings, of personal initiative and responsibility, he everywhere recognizes his obligation to show that the evidence in favor of it is inconclusive, and that the run of specialists in science are, in metaphysics and indeed in logic, crude. If, in the last resort, he invokes the will, it is within certain narrowly defined limits, and on the plea that the occasion is strictly practical and not speculative; if he decides for chance in the physical world and freedom in the moral, for an outer and an inner disconnectedness, with the splendor of God shining at the gaps—for a sort of "insane sand-heap or multi-verse" (as he says it must appear to the man of science), and no universe at all—he feels at liberty to do so precisely because reason is silent on the subject and suspense of judgment is itself an expression of will.

For our ultimate faith about the moral complexion of the universe is one that we must act on, and act on at once. We are at this very moment on the battle-field, where to retreat, or to reconnoitre, or to hesitate, is as fatally to act as to move forward to the assault. "The thesis I defend," Prof. James says, "is, briefly stated, this: Our passional nature not only lawfully may, but must, decide an option between propositions, whenever it is a genuine option that cannot by its nature be decided on intellectual grounds; for to say, under such circumstances, 'Do not decide, but leave the question open,' is itself a passional decision." It is a matter of risk simply, and in any practical exigency the risk of waiting for further information may well be greater than the risk of going forward in uncertainty. It is notably greater, Prof. James holds, in the case of belief in a moral order and in God; it is hardly an exaggeration indeed, he feels, to say that one has nothing to gain by hanging back and everything to lose. Suspense of judgment in the matter can afford us at the utmost only *le bonheur de ne pas être dupe.* But "worse things than being duped may happen to a man in this world." Our errors are not such portentously solemn things; in a scheme of affairs in which "we are so certain to incur them in spite of all our caution, a certain lightness of heart seems healthier than an excessive nervousness"; and, in the last resort, what dupery could be so complete as to forego a chance of guessing right in exchange for the certainty of not being right at all! If one is "born with such superior general reaction to evidence" that one "can guess right and act accordingly, and gain all that comes of right action," while one's "less gifted neighbor" (paralyzed by his scruples and waiting for more evidence which he dares not anticipate, much as he longs to) still stands shivering on the brink, "by what right shall one be forbidden to reap the advantages of one's superior native sensitiveness?" "At most, the command laid upon us," Prof. James urges in a note, "by science to believe nothing not yet verified by the senses, is a prudential rule intended to maximize our right thinking and to minimize our errors in the long run"; and he compares it to the "gambling and insurance rules based on probability, in which we secure ourselves against losses in detail by hedging on the total run." But this hedging philosophy requires that a "long run should be there; and this makes it inapplicable to the question of religious faith as the latter comes home to the individual man. He plays the game of life, not to escape losses, for he brings nothing with him to lose; he plays it for gains; and it is now or never with him, for the long run which exists indeed for humanity is not there for him." Dupery for dupery, it is better to be duped through hope than duped through fear; in especial when one recollects that there are cases in which belief secures its own realization—in which "belief is a factor as well as a confessor." If, for example, a man is climbing in the Alps and has the ill-luck to work himself into a position from which the only escape is by a prodigious leap, he, being without (we may suppose) any similar experience, has no evidence of his ability to perform it successfully. But hope and confidence make him sure he will not miss his aim, and nerve his feet to execute what, without those emotions, would perhaps have been impossible. "Believe, and you shall be right, for you shall save yourself; doubt, and you shall again be right, for you shall perish. The only difference is that to believe is greatly to your advantage."

"Religious fermentation," Prof. James urges in his preface, "is always a symptom of the intellectual vigor of a society, and it is only when they forget that they are hypotheses, and put on rationalistic and authoritative pretensions, that our faiths do harm." It is in protest against some similar pretensions on the part of science at the present day that the greater portion of the papers in 'The Will to Believe' are written; they advocate, in brief, "the right of the individual to indulge his personal faith at his personal risk"; and in bar of that right it is difficult to conceive what law the candid man of science could plead or could wish to plead. It must be added, however, that, up to the present time at least (there is a promise, which we gratefully register, of a completer, more systematic exposition), the considerations brought forward by Prof. James are more calculated to be of service to those who believe already than to those who do not. The strenuous mood is no more heartily intolerant of anything than of (it would necessarily in one who doubts be such) a make-believe before the fact; an established loyalty may, to defend itself, appeal openly and even with defiant pride to a postulate that is confessedly uncertain or false, but such a loyalty must in the beginning have gone out to what it took to be eternal verity. And happily so; if no more irreparable misfortune can occur to an individual or a generation of men than a disillusionment in regard to the objects of their deepest allegiance, it is on every account desirable that those objects should be chosen in the beginning for what they are. This is at once the justification of such an appeal as Prof. James's in 'The Will to Believe,' and the ground of the limitation of its applicability. For if he does not counsel us to believe in the face of demonstration, he does counsel us to believe in the face at least of probability; supposing, as he does (for the purposes of argument?) the probability, such as it is, to be on the side of science. By hypothesis, the case is not one in which we must wait for information or act absolutely in ignorance, but one in which we must act in pursuance of such information as we possess, or in utter disregard of it; and for the sort of disillusionment and blankness of mind and life that will come upon us in the latter case, if we are ever persuaded of our mistake, *le malheur de se connaître dupe* is a quite insufficient description. And if there are beliefs that create their own verification, that fact is indeed fatally significant when urged against the *laisser-faire* policy of so-called evolutionary ethics, and Prof. James has laid us all under fresh obligations by the prominence he has given it; but when he argues from it as a general principle, and suggests our relying on it blindly on the hypothesis that we have everything to gain and nothing to lose, he burdens it with a greater weight than in logic it can bear. There are beliefs also that contribute to their own refutation. The counsel to believe the world is as you want it to be, in the hope that, in some unforeseen manner, your belief may help to make it so, may justly be met by the counsel to see the world with unflinching steadiness as pre-

cisely as may be as it is, under penalty, if you refuse, of miscalculation and defeat in your every effort to make it what it ought to be. The strenuous mood can be roused by that appeal also; it may be doubted, indeed, whether it can in the long run be roused so thoroughly by any other.

The book, it is of course needless to add, is written with a freshness and vigor of word and phrase that exclude it wholly from the class of essays in philosophy that are hard reading. It is literally a delightful book, and "popular" in no sense that can make it of less service to the specialist.

ABBY HOPPER GIBBONS.

Life of Abby Hopper Gibbons, Told chiefly through her correspondence. Edited by her daughter, Sarah Hopper Emerson. Two volumes. G. P. Putnam's Sons. 1897.

The editor of this interesting book has carried to an extreme that policy of self-effacement which commends itself to the judgment of many biographical editors in our time, and is foolishly affected by a greater number. It is impossible to doubt the sincerity of Mrs. Emerson's deliberate choice, and equally impossible not to feel that she has made a serious mistake. Without enlarging the book—for, without injury, various subtractions might have been made from the fulness of the letters—more might have been shown of the order and the setting of events, with here and there a few words of commentary or explanation which would have added much. Mrs. Emerson has assumed that all who read her book will know nearly as much as she does of the anti-slavery conflict, with its Old and New Organization and like matters. But it is devoutly to be wished that it may find many readers who are ignorant where she is wise, and she has not done for them what she might have done. They will often stumble in the dark where they might and should have had a trusty guide.

Mrs. Gibbons, whose life is here told "chiefly through her correspondence," was born Abby Hopper, December 12, 1801, the third child of Isaac Tatem and Sarah Tatum Hopper. Of Isaac T. Hopper little is told, it being assumed, perhaps rashly, that his Life by Lydia Maria Child is still a well-known book. Happy are they who remember it. It furnishes a delightful, if not necessary, background to the figures painted here. A few letters written when Mrs. Gibbons was seventy-seven to a granddaughter give us a vivid picture of her childhood, but her contemporary correspondence does not begin until 1829. The letters of this time afford many humorous glimpses of the modest insurrection of young people, inclining somewhat to pleasure and beauty, against the ascetic strictness of the Quaker rule, which, however, stopped so far short of the table that the Yearly Meeting passed into a proverbial satire as the Merely Eating. There are reflections on "the Friend who did not feel easy to eat off a gilt-edged plate," confessions of being "a *little particular* about the *cut* of a garment," rejoicings over new china, discussions of belts, bows, and ribbons from a religious point of view, and a record of "five persons disowned for outgoing in marriage and one for having joined the Presbyterians," at one fell swoop. In 1831 Abby Hopper met James S. Gibbons, and they were married in 1833. Mr. James Herbert Morse describes the husband, his father-in-law, with much brave sincerity. "Where feeling was not enlisted, he was a philosopher. . . . But where feeling was touched—or was it prejudice, the long, back record of feeling?—then philosophy went to the winds." The preëminent distinction of his life, though not by any means his most valuable achievement, was his war song, "We are coming, Father Abraham," which, very naturally, had a tremendous vogue. It was written in 1862 in answer to Lincoln's call for 300,000 troops, and, being published anonymously in the *Evening Post*, was, for a long time, attributed to Bryant. Had the mob of 1863 known Mr. Gibbons as its author, his house would have been gutted with greater relish, if possible, than was actually shown.

The song was certainly a strange one for a Quaker to project into the public mind. But the Quakers had not treated Mr. Gibbons and his friends so handsomely as to nourish his ancestral creed, and he was naturally a man of war. The Meeting had fallen away from the original principles of Quakerism much more than he. In 1842, with Isaac T. Hopper and Charles Marriott, he was disowned "for being concerned in the publication and support of a paper [the *Anti-Slavery Standard*] calculated to excite discord and disunity among Friends." Every sect had in those times its lowest depth, and this action matched for the Friends the refusal of Dr. Channing's Society to allow him the use of its church for Dr. Follen's funeral. One George F. White is pilloried as the prime mover in the pro-slavery Quaker movement. Not content with stirring up strife in New York, he extended his efforts to Philadelphia. The letters that record these doings glow and burn with righteous indignation. One from Lydia Maria Child is strangely interjected into a body of foreign matter, but it is an arraignment of the "New Organization," Whittier included, that deserved preservation in place or out of it. In 1842 Mrs. Gibbons resigned her membership in the Meeting for anti-slavery reasons, and asked to have the names of her children erased from the list of members. Isaac, the youngest, "the little emancipated," was not named because he was born after his father's expulsion.

Great sorrows entered into Mrs. Gibbons's life; she lost several children, and no letters here are likely to be more helpful than those she wrote in her bereavement and those written to her. The idyl of the book is her relation to her son "Willie," who died suddenly from an accident apparently trivial, midway his course in Harvard College. His was a case of "unfulfilled renown," so surely was he destined by his moral genius to share the honors of such young men as Shaw and Winthrop and Putnam and Lowell, if not their enviable death. A chapter headed "John Brown" is disappointing, so little does it contain concerning him. We are told that a few weeks before the raid he called and "confided to Mrs. Gibbons the full particulars of his plan for the uprising at Harper's Ferry." But her surprise in the event is spoken of as great, and hence it would appear that the plan he confided to her was not carried out. For three years and a half Mrs. Gibbons devoted herself, generally in company with her daughter Sarah, to hospital work, and her letters and journals covering this experience are full of interest and abound in local color, particularly black. Her sympathy with the slaves was a source of considerable friction in her relations with army officers. Her humanity in general had much the same effect. Those who think war is something nice could not do better than to read these hospital chapters and see what it was at its best, when it was just and not to be escaped. Involved in Banks's miserable retreat in West Virginia, Mrs. Gibbons had plenty of excitement and some hair-breadth escapes. Afterwards, at Point Lookout, the interest centres in the freedmen, pursued, maltreated, carried off by their former masters, long after the promulgation of the emancipation proclamation; a Maryland Colonel of Union troops conniving at every possible iniquity. He complains of Mrs. Gibbons as a "Protectress-General of all who get themselves into trouble, and censor of affairs military, religious, and moral"; thinks she "goes beyond her proper sphere, and might be disposed of." But it was Mrs. Gibbons who came off victorious. She generally did, thanks to an intuitive shrewdness, which not only rescued her from the difficulties into which she was led by an ardent disposition, but interpenetrated that, making her wise even when she appeared most rash.

The riots of July, 1863, afford the most interesting episode in the book. The Gibbons house was sacked, with but fifteen minutes' warning, so that but few things were saved out of the general wreck. Mrs. Gibbons was at Point Lookout and Mr. Gibbons was away from home at the critical moment. Mr. Joseph H. Choate assisted the daughters in their escape from roof to roof and finally to his own house. Mr. Gibbons wrote, "I am ashamed to have deserved no more." Returning for a few weeks to her ruined home, September found Mrs. Gibbons again with the sick and wounded soldiers. It is to be hoped that her personal impression of the Christian Commission was not just. She was not incapable of prejudice. It is with evident satisfaction that she tells of a dying boy concerning whom an agent of the Christian Commission eagerly inquired, "Madam, did you catch his last words?" and was horrified to learn that he was singing "Possum up a gum-tree."

The conclusion of the war brought Mrs. Gibbons no discharge from social duty. In advance of it she had been interested in various reformatory work, looking more particularly to the reformation of women and children. When nearly ninety she went to Albany and carried a bill for the appointment of police matrons through the Legislature, only to have it vetoed by Gov. Hill. In her ninety-first year she was again in Albany working for a reformatory for women, and carrying the labor of months to a successful issue by her untiring energy and tact. Social benevolence was the ruling passion of her life, but her interest in organized charity abated nothing of her personal interest in the unfortunate. Her individuality was too positive to be made subject to any organization, except possibly that of the Republican party, which was for her always in the right because it had decreed the death of slavery. The book is refreshing and inspiring from the contact it affords with a personality so vigorous and positive and unique, uniting in itself such different strains, at once so tender and so strong. If widely read, as it deserves to

be, the book will not only make many women feel ashamed of their frivolity, but will convince them that there is a straighter path to happiness than theirs.

The French Revolution and English Literature: Six lectures delivered at Princeton University by Edward Dowden, LL.D., D.C.L., etc. Scribners. 1897.

This attractive little book of nearly 300 pages is the first of the series of "Princeton Lectures" which are to comprise in seven volumes the lectures delivered by distinguished foreigners at the sesquicentennial celebration of Princeton University. The material of Prof. Dowden's essays is, with some additions, taken from lectures delivered by him at Cambridge, England, as "Clark Lecturer" in English literature. Prof. Dowden's aim has been to give their proper historical setting to the chief figures in English literature in the period, roughly speaking, from 1770 to 1820, and to trace the influence on them and their writings of the leaders of the revolutionary movement in France and England. It is an interesting study of the workings, in the literary mind, of the Revolutionary ideas of human perfectibility and "simplification" through a return to nature,which some put in practice by discarding hair-powder and the cocked hat, others, like Maria Edgeworth's father, by trying to bring up their sons in republican simplicity on the pattern of the priggish hero of 'Sandford and Merton.' The personal history of Thomas Day, the author of 'Sandford and Merton,' showing how the 'Contrat Social' and 'Émile' fermented in a British brain, may here be read as an entertaining commentary on a work that has long ceased to amuse. Mr. Dowden relates how, rejected by Edgeworth's sister for his uncombed hair and table-manners, and despairing of all systems of feminine education but his own, Day reared two foundlings, a blonde and a brunette; how, in course of time, the brunette, Lucretia, forsook him and married a linen-draper; how he, in turn, forsook Sabrina, the blonde, on her betraying certain fatal weaknesses of mind. "When, to give her hardihood, he fired pistols at her petticoats, Sabrina screamed; when he dropped melted sealing-wax on her large and white arms, she started. Finally, she did, or she did not, wear certain long sleeves which had been the subject of his aversion or his liking, . . . and he quitted her forever."

The gentle Cowper is classed with the "precursors of revolution" less by virtue of such utterances as his prayer for the fall of the Bastille than by his desire for simplification, and that sensibility for animals which he shared with Coleridge and other Revolutionary sympathizers, and which made them the sport of the Anti-Jacobins. In the poem called "New Morality" they satirized Sensibility:

> "Taught by nice scale to mete her feelings strong,
> False by degrees and exquisitely wrong;
> For the crush'd beetle *first*, the widow'd dove,
> And all the warbled sorrows of the grove;
> *Next* for poor suffering *Guilt;* and, last of all,
> For parents, friends, a king and country's fall."

It was with satire such as this that Canning and the Tories in their review, the *Anti-Jacobin*, raised a laugh against these younger literary enthusiasts of Revolution.

In his lecture on the "Theorists of Revolution," Professor Dowden traces the special influence of Godwin, exerted personally and through his treatise 'Political Justice,' on the literary men of the day. Southey, Coleridge, and Wordsworth were disciples of Godwin for a period of youthful enthusiasm, while Shelley, who lacked the balance and power of original thought of the others, pushed his father-in-law's doctrines to their logical consequences. The failure of the Revolution in its historical development finally worked the disillusion of Wordsworth and his friends, but they maintained a tempered enthusiasm for the theory. In his lecture on "Recovery and Reaction," Professor Dowden says of Wordsworth that, in his disappointment, "he retained his desire to simplify life, . . . he lost none of his sense of the dignity of man as man, . . . he thought less, indeed, than formerly of man in an abstract way and of the rights of man; but he entered far more deeply into the joys and sorrows of individual men, . . . he ceased to speak of fraternity and equality; but this was because he perceived a certain effeminacy in levelling down the truth to general notions and ambitious words." This mood of resignation turned to something like the earlier glowing faith when England became the champion of freedom against Napoleon. "The noblest products in the field of pure literature which the Napoleonic wars have left us are Wordsworth's political sonnets, his poem 'The Happy Warrior,' and his pamphlet on the 'Convention of Cintra'" (p. 214).

The three most energetic opponents of the literary reaction against revolution were Landor, Byron, and Shelley. After his abortive expedition in help of Spain, Landor, in disgust at the new despotisms of Europe which followed the fall of Napoleon, diverted his interest to the South American Republics, "partly, he says, because he wished every nation under heaven to be independent; partly, because he thought it would be advantageous to England that some counterpoise against the power of the United States should be found on the American Continent." Byron "had a strong feeling for the Revolutionary movement as a destructive force, . . . but he cared little for the principles . . . which are positive. constructive. social. . . . He could do little more than plead for an emancipation of egoism. . . . He asserted with emphasis the prerogative of man to do what he likes, where he likes, when he likes, how he likes." Byron's heroes and heroines, his Corsairs, Giaours, and Pirates, carried out his theory of individualism; to us they seem melodramatic marionettes; but Professor Dowden maintains that they "were once as much alive as certain favorite heroes and heroines of contemporary fiction are at the present day. Perhaps *Nora Helmer* and *Hedda Gabler* may by and by repose in the old marionette-box, and the wires by which their limbs are convulsed may have grown rusty. . . . Let us feel towards Byron's Oriental figures with some tenderness, for they deserve it" (p. 272). Several years since, in 'Transcripts and Studies,' Mr. Dowden wrote at length on Shelley, and in these lectures he could add little to that estimate. His closing paragraph, with its fine contrast of Byron and Shelley, is worth quoting:

> "In Byron we find an expression of the Revolution on its negative side, . . . in Shelley an expression of . . . its positive side. As the wave of revolution rolls onward, driven forth from the vast volcanic upheaval in France, and as it becomes a portion of the literary movement of Great Britain, its dark and hissing crest may be the poetry of Byron; but over the tumultuous wave hangs an iris of beauty and promise, and that foam-bow of hope, flashing and failing, and ever reappearing as the wave sweeps on, is the poetry of Shelley."

Cyprian: His Life, his Times, his Work. By Edward White Benson, D.D., D.C.L., sometime Archbishop of Canterbury. With an Introduction by the Right Rev. Henry C. Potter, D.D., LL.D., D.C.L., Bishop of New York. D. Appleton & Co. 1897. 8vo, pp. xxxvii, 636.

It is impossible not to look with respect on this volume, to which for thirty years the venerable Primate of England devoted the leisure left to him by more engrossing duties. Fortunately for him, he lived to complete it, even to the proof-reading, and if he was denied the satisfaction of witnessing its publication, he had derived from it what is the truest reward of authorship—the consecration of his powers to a worthy object. That he himself recognized this is indicated by the entry in his diary recording its completion: "If it ever sees the light, many will think it a very odd book. Folk are edified in such different ways. But it has edified me, which is what I began it for."

When a man of culture and scholarship devotes half a lifetime to a single subject, one expects to find that subject treated with all that research can bring to bear to illustrate it on every side. In this the reader will not be disappointed. The author has spared no labor to familiarize himself completely with the condition of society in the third century, and with that of the African province in particular; he has saturated himself thoroughly with Cyprian's writings, which he analyzes carefully and elucidates minutely with all the resources derivable from Roman jurisprudence and Christian archæology and theology. His object has evidently been to place himself as much as possible in the position of a contemporary, in so far as relates to the causes and immediate consequences of the events described, while retaining the vantage-ground of a modern in pointing out their ultimate results.

With all the advantages, however, resulting from this mode of treatment, there is the drawback almost inseparable from a work passing through so long a course of incubation. The arrangement is confused by the injection of learned episodical discussions of minute points. Historical perspective is lost and the general effect is marred by the multitude of adventitious matters introduced. The overflow of conscientious learning has a tendency to obscure, till one scarce can see the wood for the trees. The style, moreover, leaves much to be desired. From a prefatory note by the author's son we gather that this is the result of deliberate intention. "I only wish," he reports his father as saying, "to say the obvious thing without the customary periphrasis; it all comes of hours spent with intense enjoyment over Thucydides, weighing the force of every adjective and every particle." This perhaps explains why the end of a sentence sometimes seems to have so little connection with the beginning that the reader is puzzled to trace the current of thought that has developed

so unexpectedly. It does not excuse, however, the reckless use of pronouns of which the antecedent is doubtful, nor the apparent settled conviction that a sentence can be complete without a verb. There are passages in which the author rises to a manly and sustained eloquence, but as a whole the book is not easy reading for a careful student.

It probably was not Archbishop Benson's intention to write a polemical treatise under the guise of an historical biography, but, given his position as an Anglican churchman, his choice of a subject rendered this almost inevitable; in fact that choice may not improbably, though unconsciously, have been influenced by the opportunities which it afforded for such treatment. Cyprian was the master-mind of the Latin Church at a period when primitive simplicity was gradually developing into hierarchical organization, and the struggle had already commenced between centralization and localization. During his brief pontificate, from 248 or 249 to his martyrdom in 258, he took a commanding position in that struggle, vindicating on the one hand his full authority as Bishop, and on the other his independence of the Petrine see. Naturally he thus represents the ideal of Anglican episcopacy, and his acts and his writings have served as an armory from which subsequent controversialists have drawn their weapons.

Cyprian, in fact, has been a thorn in the Ultramontane side, especially since the Vatican decree rendered *de fide* the direct and immediate supremacy of the Holy See over every parish and every Catholic, thus realizing, after nearly six centuries, the dream of Boniface VIII., which found expression in the bull *Unam Sanctam*. There was his unquestioned sanctity and the veneration which he inspired in such doctors of the Church as St. Augustine; there is the stubborn fact that he is enrolled in the Roman calendar of saints with commemoration in the canon of the mass. Yet there are also his unqualified resistance to Roman dictation, his assumption of equality with the Bishop of Rome, and the theory which interpenetrates his works of the unity of the church coexisting with complete episcopal independence in the diocese. That this, moreover, was the recognized ecclesiastical organization in the third and fourth centuries is forcibly manifested by the author (p. 435) in showing that, throughout the great controversy over the rebaptism of heretics, the debaters on the Roman side, which finally prevailed against Cyprian, appealed to tradition and to argument, but never to the authority of the Holy See. They supported its view, but they never imagined that it had any authority to decide the question. In fact, the complaint of St. Optatus against the Donatists is not that they were rebellious to the Petrine Church, but that they refused to let the imperial power define their religious beliefs. Modern Catholic writers thus have a difficult subject to handle in Cyprian; forgery and interpolation have been employed to make him contradict himself, and the most improbable theories have been injected into history, all of which the author follows up and exposes with a holy zest indicative of the living actualities of the questions started some sixteen hundred years ago. At the same time he does not neglect the opportunity which his subject affords to combat Presbyterianism and its "truncate communities."

To these strong Anglican convictions is owing a curious blindness to the possibility of Cavour's ideal, the "libera chiesa in libero stato"—the disconnection between Church and State. To the good Archbishop this is a recrudescence of the Donatist heresy and even worse, for it opens out to him the most awful consequences. "It gives up Christianity and it gives up the world. . . . It is content that States should have no profession of the Truth of Christ. . . . It gives up Christianity. For it confesses that there are powers in the world which Christianity cannot and dare not deal with, gates of hell which must be left to prevail" (p. 529). Considering this and a confirmatory passage which he quotes from Bishop Lightfoot, we can readily understand why the House of Lords, with its bench of bishops, has offered such strenuous resistance to the legalization of marriage with a deceased wife's sister, and we can forecast the bitterness of the final struggle for disestablishment.

In a couple of pages of introduction, Bishop Potter has rendered a graceful tribute to the labors of Archbishop Benson, but it would have been in better taste had he not allowed the publishers to display his name so prominently on the title-page.

The Diseases of Plants Caused by Cryptogamic Parasites. An Introduction to the Study of Pathogenic Fungi, Slime-fungi, Bacteria, and Algae. By Dr. Karl Freiherr von Tubeuf. English edition by W. G. Smith, Ph.D., Lect. Edin. Longmans. 1897.

One of the most striking instances of rapid and satisfactory division of labor in scientific fields is presented by cryptogamic botany. Only a few decades ago, all that was positively known about the structure and habits of flowerless plants could be reasonably assigned to the keeping of those who were general botanists, but the development of the subject has been so rapid, and, on the whole, so satisfactory from the point of view of scientific accuracy and thoroughness, that successive reassignments have been found desirable from time to time. In the treatment of the single class of flowerless plants called fungi—a class which comprises within its somewhat uncertain limits mushrooms, rusts, moulds, bacteria, and all sorts of uncanny organisms—it has been absolutely necessary to divide and subdivide the work among specialists, and even now some of the newest comers in the field are looking anxiously for the relief which will follow further minute subdivision.

This tendency towards minute subdivision is sound and natural. Extreme specialists may be much narrowed by it in their outlook and their views, because they must confine themselves to a very limited district for study; but, fortunately, there still remain, in the Old World and the New, some who, by their training and strength, have been able to retain a hold on the different departments of cryptogamic botany as these successive separations have occurred. In our own country we have Dr. Farlow, whose grasp of the subjects of algae, and of fungi as well, enables him to preserve a sense of proportion and perspective with regard to all these minor groups. In the Old World there are, perhaps, not more than two or three of whom this can be said. The whole drift is towards minute specialization, and the specialist may be deemed happy who can look out clearly beyond his own borders.

Perhaps the difficulty which surrounds the investigation of the structure and what is called, for want of a better term, the life-history of any organism, will be better understood if we remind our readers that almost every step requires the assistance of the compound microscope, and that each step is time-consuming in its employment of a complicated technique. It might be thought that here, as elsewhere, many hands might make light work, but this is not so. Each one must complete his own task, and in his own way. Each of the many hands may undertake separate tasks, and then remains the important and oftentimes discouraging problem of coördinating the results which must be verified, but which, from the very nature of microscopic technique, can hardly be repeated with exactly the same conditions as before. In the work before us there is a well-planned attempt to accomplish this task of coördination in the department of plant diseases which depend on the invasion of cryptogamic organisms. On the whole, the treatise is very satisfactory. Facts have been gathered with thoroughness, transcribed with accuracy, and weighed truly. Moreover, the translation is good. It places in the hands of the student and general reader an immense mass of details arranged in convenient and telling fashion. We are not a little curious to see whether it will have the effect of repressing the somewhat abnormal activity in this department, especially in the case of those who are engaging in the work with too little preparation. Perhaps, however, it may wholesomely stimulate to better and more thorough work. This last was plainly the object of the author and of the translator. We feel sure that the reader who glances at a treatise like this for the first time will be greatly impressed by the diversity of effects which ensue on the invasion of destructive fungi and the like. Not only can cells and tissues be broken down, and organs practically annihilated, but there are instances where, through the marvellous reaction of the plant or its parts, new shapes are brought into existence and old shapes disguised. The changes go so far even as to effect the reappearance of lost parts, such as abortive or suppressed stamens, and so on. In a word, when the foreign influence begins to be felt, new growths follow, and these growths are by no means the same in all organisms, even when the exciting cause is the same. We wish we could bring from the perusal of this book better cheer as to the cure of this class of plant diseases. Much has been done by new methods of spraying poisonous liquids on the victimized and stricken plants in order to kill the invaders or their advance skirmishers, but very much more remains to be done. Fortunately, both in this country and abroad, the great zeal which characterizes investigation in the whole department of vegetable pathology gives ground for encouragement. We may hope that, at no very distant date, some of the most destructive maladies may be completely stamped out and others held in check.

Souvenirs d'Amérique et de Grèce. Par Pierre de Coubertin. Paris: Hachette & Cie. 1897.

M. de Coubertin has been prominent for several years as a promoter of international-

ism. The world is not so ungrateful as to have forgotten his energy in urging the revival of the Olympic games, and if he is as successful in his present enterprise, and manages to deflect the current of American students from Germany to France, he will have deserved even better of his country than he did in his more showy experiment, which did not redound to the especial glory of French athleticism. For, international as he is, M. de Coubertin is too much of a patriot not to put France in the first line, for which no one will blame him. But somehow these international promoters get scant thanks.

In less than a hundred pages M. de Coubertin leads us an international dance from Chicago to California, from the sesquicentennial of Princeton to the toboggan of Canada. In less than a hundred pages he unfolds his view of the Olympic games of old, touches off the main features of the Olympic games of 1896, and gives us a tourist's glimpse of Corfu—not the least attractive chapter in the book. In the American half, M. de Coubertin emphasizes the inevitable contrast between the feverish nightmare of Chicago and the tranquil dream of the World's Fair; between "the army of unhappiness recruited from all the shipwrecked of Europe" and the joyous crowds that filled the grounds of the Columbian Exposition; between the foreign stratification of the great city and the symmetrical incorporation of American idealism in Jackson Park. To this American idealism M. de Coubertin is eager to do justice. Perhaps he does it more than justice; but he cannot refrain from little skits at American peculiarities. Our way of decorating buildings he likens to the display of the wash of circus clowns, and he is evidently not much edified by President Harper's comparison of the working of the University of Chicago with the running of a railroad. President Harper's comparison not only lacks novelty, but fails to represent true American university ideals, and as to the adornment of buildings, it may be said that Americans find the European fashion of hanging old rugs out of the windows in times of rejoicing quite as absurd as M. de Coubertin finds our display of bunting. So hard is it to be cosmopolitan.

The chapter on the university movement in the United States leads up to a plea for closer interchange between America and France. France does not know the good work that is done on this side, and America has cooled towards France. The notion of French decadence has penetrated the university world. The French language has receded and French science has lost its prestige. Our historians underrate the part France has played in our past. Bancroft inaugurated this historical ingratitude, but McMaster has made an advance on Bancroft, and has managed to tell the story of the independence of the United States without pronouncing the name of Lafayette.

All this is more or less epigram. M. Brunetière would have a different tale to tell about the receding of the French language and the decline of our interest in things French. Paris swarms with American students of art, and no American scholar is ignorant of the remarkable work that is done in France. "Unfortunately," to quote the language of an eminent French classical scholar, "the French have officers enough, but they have no army." It is not the German professor alone, it is the university life of Germany, that has attracted and continues to hold the American student. If that life slacks (and it seems to be slackening), no amount of superior intellectual productivity will avail. It is, indeed, not unlikely that the French schools will have their day once more, and M. de Coubertin's efforts to bring about that good time are highly creditable to his patriotism; but these currents cannot be set up at will.

The chapters on the Olympic games are sad reading now in view of recent events, which have formed a bitter commentary on the well-known verses of Euripides, in which the atrabilarious poet follows the thinkers of his time in minimizing the importance of athleticism. M. de Coubertin is a believer in athleticism, in "sport," which, like all adopted English words, has a much more devil-may-care aspect in French than in its native habitat. The original institution of the Olympic games was, he contends, a glorification of "sport"; and he thinks that scholars have sophisticated themselves in their views of the games, and have tried to explain away the fact that the Greek people, "creator" as it was "of beauty, enamoured as it was of poetry, of dreams, of harmony, periodically forced all these divine gifts to do obeisance to the royalty of muscle." Hellenists, it seems, have sought the secret of the Olympic games everywhere rather than in the heart of things, in the "sport" itself. The so-called religious element is nothing but poetic gilding. The worship of physical beauty is naught. The athlete himself is not beautiful. There is no real beauty in the games as such. What is beautiful in them is ambition and will. In fact, all athleticism is summed up in the three words that Père Didon gave as a motto to a football team, *Citius, fortius, altius.* "These words form a programme of moral beauty. The æsthetic of 'sport' is an immaterial æsthetic." The motto is a good one, and will answer admirably for a variety of spheres. *Citius, fortius, altius* would look well as the device of a roof-garden, and fitly enshrine the moral beauty of the high kickers.

In pursuit of his theme, M. de Coubertin traces sympathetically the revival of athleticism, especially in the closing years of the century. American athleticism he thinks due to the "war of secession"; French athleticism to the "disaster of 1870." The resuscitation of the Olympic games is the consecration of the movement. This way of looking at the matter has the merit of extreme simplicity, and any commentary might break the charm. The account of the performances in Athens is much more meagre than was to be expected, and in the descriptive portions of the book it is only too evident that M. de Coubertin is an admirer of Pierre Loti.

Zwischen Alaska und Feuerland. Bilder aus der neuen Welt. Von Gustav Brühl. Berlin: A. Asher & Co. 8vo, pp. 722.

Any one desirous of becoming acquainted in a pleasant way with the more interesting points of both Americas, without the hardships of trudging through dry and treeless valleys, endless wastes and malarial swamps or of climbing rocky cliffs, should, if he have command of the language, read Brühl's book. It is written in a lively and attractive German style, and, though its author is a specialist in American archæology, it does not smack of book-learning of the dryasdust sort. A man of Dr. Brühl's extensive experience as a traveller and historic knowledge knows how to select from his wide and numerous peregrinations just those facts and sights which chiefly attract cultured readers; and after reading twenty pages of this volume they will no longer take fright at its bulk. Brühl's purpose was not to describe America as a whole in a uniform style of topography; we soon discover that he has an eye for what is grand and impressive in nature, extraordinary in quality and dimension, and also for what is characteristic respecting the tribes or nations inhabiting the different countries. This predilection it was that prompted the Cincinnati physician to visit and describe the wonders of the Yellowstone region, the Grand Cañon, and the smaller gorges through which the Colorado of the West pours its turbid waters. The writings of Charles F. Lummis probably caused him to explore Arizona's wildernesses and inspect the Natural Bridge and the petrified forest, which have had comparatively few visitors. Alaska, Niagara, and the Thousand Islands are too old a story for us to dwell upon. By this route we are brought to the sunny climes of Mexico and especially of Yucatan, where archæologic tastes may revel with the love of nature. The pyramid of Xochicalco, "at the flower-building," visited repeatedly by Dr. Brühl, and described as early as 1791 by the Padre Alzate, is situated in the wilderness southwest of the City of Mexico. In spite of its dilapidated state, it still extorts admiration by its beauty and huge dimensions. The upper part is almost gone, but what remains is covered with sculptures described in detail in the author's very circumstantial relation. When he reached Yucatan, the country was in distress, for the "Indios sublevados" threatened the peace of the state more than ever; but nobody interfered with his excursions to Aké, with its pyramid, to Labna, to the sculptures on the sugar-hacienda of Tabi, to Mani, the celebrated domain of the Tutul-Xiu dynasty, to Zangi in the centre of the forest, and to Kabah. The ruins most frequently visited by swarms of tourists are those of Uxmal. Not a single navigable river exists in Yucatan. Of curiosities Dr. Brühl notes a certain well or *pozo;* light or volatile articles falling into it in the morning hours will be brought up again in the afternoon by a change of the air-current. In Uayalceh there is a thick ceïba-tree, which grows out of a deep zenote or natural rock-well. Mitla, in the land of the Zapotec Indians, is famous not only for its temple, but also for its enormous cypress-trees.

Dr. Brühl's pen-pictures of South America are equally attractive with the foregoing, and readers will follow him easily through many valleys of the mighty Cordilléras, through Chili, around Cape Horn, and to the capitals of the eastern coast. His descriptions of Lake Titicaca and its island of the same name, and of the towering giant mountains Illimani and Illampu, possess a special and absorbing interest.

Public Library Jul 30 97 Copley Square

SECOND EDITION.

EQUALITY.

By EDWARD BELLAMY, Author of "Looking Backward," etc. 12mo. Cloth, $1.25.

"The book is so full of ideas, so replete with suggestive aspects, so rich in quotable parts, as to form an arsenal of argument for apostles of the new democracy. . . . The humane and thoughtful reader will lay down 'Equality' and regard the world about him with a feeling akin to that with which the child of the tenement returns from his 'country week' to the foul smells, the discordant noises, the incessant strife of the wonted environment. Immense changes are undoubtedly in store for the coming century. The industrial transformations of the world for the past hundred years seem to assure for the next hundred a mutation in social conditions commensurately radical. The tendency is undoubtedly towards human unity, social solidarity. Science will more and more make social evolution a voluntary, self directing process on the part of man."—SYLVESTER BAXTER, in the *Review of Reviews.*

"'Equality' is a greater book than 'Looking Backward,' while it is more powerful; and the smoothness, the never failing interest, the limpid clearness, and the simplicity of the argument and the timeliness, will make it extremely popular. Here is a book that every one will read and enjoy. Rant there is none, but the present system is subjected to a searching arraignment. Withal, the story is bright, optimistic, and cheerful."—*Boston Herald.*

"So ample was Mr. Bellamy's material, so rich is his imaginative power, that 'Looking Backward' scarcely gave him room to turn in. . . . The betterment of man is a noble topic, and the purpose of Mr. Bellamy's 'Equality' is to approach it with reverence. The book will raise many discussions. The subject which Mr. Bellamy writes about is inexhaustible, and it has never-failing human interest."—*New York Times.*

"INTENSELY INTERESTING."

Peter the Great.

By K. WALISZEWSKI, author of "The Romance of an Empress" (Catherine II. of Russia). Translated by LADY MARY LOYD. With a Portrait. Small 8vo. Cloth, $2 00.

"One of the most interesting biographies of the historical kind we have read for a long time. . . . Intensely interesting because absolutely unique."—[London Daily Chronicle.

"A finished and artistic portrait of this extraordinary man. . . . An elaborate character sketch."—[London Standard.

"It is a marvellous story, this of 'Peter the Great,' and it has been told with great spirit by the author, who is able to include in his narrative many new anecdotes and much other material that is practically new to English readers."—[London Saturday Review.

BY THE SAME AUTHOR.

The Romance of an Empress.

(Catherine II. of Russia). Uniform with "Peter the Great." With a Portrait. Small 8vo. Cloth, $2 00.

"Of Catherine's marvellous career we have in this volume a sympathetic, learned, and picturesque narrative. No royal career, not even some of the Roman or papal ones, has better shown us how truth can be stranger than fiction."—[New York Times.

Some Unrecognized Laws of Nature.

An Inquiry into the Causes of Physical Phenomena, with Special Reference to Gravitation. By IGNATIUS SINGER and LEWIS H. BERENS. Illustrated. 12mo. Cloth. $2.50.

This is an entirely new and original work, the result of long study and independent practical experiment. It has grown out of the experience of the authors in their attempts to apply the physical method of inquiry to the elucidation of biological problems, more especially those which arise in connection with the life of man. By a close examination of the action of force on various bodies it is hoped that a new light may be thrown on the laws of Nature, including the causation of phenomena.

Familiar Features of the Roadside.

By F. SCHUYLER MATHEWS, author of "Familiar Flowers of Field and Garden," "Familiar Trees and Their Leaves," etc. With 130 Illustrations by the Author. 12mo. Cloth, $1.75.

The country roads have a life of their own of great interest if one is properly guided, and Mr. Mathews has written his book in order to set forth the life of the trees, bushes, flowers, insects, and birds which are found along the roads. He has carried out an idea which will interest those who walk, or drive, or ride a wheel in the country, and the book will be indispensable for any one who lives in or visits the country.

Insect Life.

By JOHN HENRY COMSTOCK, Professor of Entomology in Cornell University. With Illustrations by ANNA BOTSFORD COMSTOCK, member of the Society of American Wood Engravers. 12mo. Cloth, $2 50.

A popular book of general value and interest which will meet a want felt by teachers and be indispensable for classes, and will also prove of constant service to those who have felt the need of a guide to the identification and study of insects. It is a book for amateurs and summer tourists as well as for students, and is magnificently illustrated by Mrs. Comstock's accurate and beautiful wood engravings.

The Menopause.

A Consideration of the Phenomena which occur to Women at the Close of the Child-bearing Period, with Incidental Allusions to their Relationship to Menstruation. Also a Particular Consideration of the Premature (especially the Artificial) Menopause. By ANDREW F. CURRIER, A.B., M.D. 12mo, 284 pages. Cloth, $2.00.

A book useful not only to the physician, but also to women who are approaching that so-called critical period of life in which their existence is rendered miserable by doubts and fears, many of which are unfounded, as is demonstrated by the author. The work is written in a style which can readily be understood by any intelligent reader.

HAMLIN GARLAND'S NEW BOOK.

Wayside Courtships.

By HAMLIN GARLAND. 12mo. Cloth, $1.25.

One of the most characteristic phases of life in the West is the movement of its people, particularly of its young men. The latter are always on the road to college, to the city, to places farther west. On the way a woman's face often causes the young man to pause, turn, and perhaps remain. This motive underlies the book. On her part the woman finds a peculiar fascination in the passing of the stranger and the effect upon her life. A deeper interest still is suggested in the poem and elsewhere in the book. "Wayside Courtships" will be found to be a most significant expression of the author's strong and individual talent.

Uniform with "Wayside Courtships." New Editions of Mr. Garland's other books. Each, 12mo, cloth, $1.25.

A SPOIL OF OFFICE. *A Story of the Modern West.*

A MEMBER OF THE THIRD HOUSE. *A Story of Political Warfare.*

JASON EDWARDS. *An Average Man.*

LATEST ISSUES IN

Appletons' Town and Country Library.

Each, 12mo. Paper, 50 cents; cloth, $1.00.

The Folly of Pen Harrington.

By JULIAN STURGIS, author of "John Maidment," "An Accomplished Gentleman," etc.

The author furnishes an acute and entertaining study of a member of the fashionable world in London, who attempts to preach a doctrine of absolute equality, and to ameliorate social conditions. The pictures of her environment and her varied experiences and adventures furnish most interesting subject-matter.

Nùlma.

By Mrs. CAMPBELL-PRAED, author of "Mrs. Tregaskiss," "Outlaw and Lawmaker," "Christina Chard," etc.

In this story, which is written with great care and force, the author returns to the field of antipodean romance, which she has cultivated with such marked success. Her novel pictures social and official life, with its picturesque colonial environment, and as a story it will be found singularly sympathetic and interesting.

For sale by all booksellers, or will be sent by mail on receipt of price by the publishers.

Educational.

CALIFORNIA, Belmont. (In the foothills near San Francisco.)

BELMONT SCHOOL for Boys hopes to deserve the confidence of Eastern as well as of Western parents by surrounding its boys with as stimulating an intellectual, spiritual, and physical life as is found in the best Eastern schools, and by offering a home which in beauty of surroundings and fineness of climate for sustained work no Eastern school can hope to equal. To this end it is equipped with every needful educational, sanitary, and recreative appliance to fit boys for the best colleges and technical schools, and it should give to them a healthful impulse towards good thinking and good living, and leave with them a heritage of pleasant and helpful memories. The catalogue, containing views of the school and a record of the colleges and technical schools entered by its graduates, will help to give an idea of its spirit and the work it is doing

MICHIGAN, Orchard Lake.

MICHIGAN MILITARY ACADEMY.

A thoroughly equipped College Preparatory School, abreast of the most progressive Eastern Academies. Catalogue sent upon application.

Teachers, etc.

AN EPISCOPALIAN CLERGYMAN wishes to receive into his family two youths or young men for preparation for or the forwarding in their college or other educational course. An exceptional climate permits such work under the most favorable conditions, and the most thorough, conscientious oversight of study, as well as instruction, is assured. The pupils of the gentleman have always gone beyond their class, and have attained fine physical condition.

Golf, tennis, and basketball clubs afford means of daily outdoor exercise; instruction and practice in horseback riding, with so much of the military setting-up drill as the daily inspection by a fine physician connected with the U. S. Army deems conducive to health and of use in forming an erect, easy carriage; lessons in dancing and attendance (unless otherwise desired) at the informal post hops are great factors in the same direction. A large, well-furnished house, abundant, pure water, well-ventilated sleeping room, good library, quiet, refined home life; abundant, well-served table, and constant, careful supervision of clothing, and everything conducive to the comfort of pupils will be given.

The terms, including use of a piano if desired, instruction in German and French by native teachers, are one thousand dollars ($1,000) per year, one-half in advance, balance at the commencement of last half of year. Will take them September or earlier if desired. Address "INSTRUCTOR," Fort Logan, Colorado.

Full particulars given by mail, or will welcome a personal discussion if desired.

LECTURER ON THE FRENCH LANGUAGE and Literature required for Victoria College, Toronto. Must be an experienced teacher and competent to give instruction in the French Language as required by the Curriculum for the B.A. degree in all Departments of the University of Toronto. Duties to begin with opening of session, 1897-98.

Applications, with testimonials, to be sent before August 1 to N. BURWASH, LL.D., President,
Victoria College, Queen's Park, Toronto.

A SPECIALIST IN MODERN LANGUAGES, History, Literature, and Political Science, native of Hanover, Germany, Ph.D., A.M., Graduate of Vienna, Paris, and Kentucky Universities, desires a professorship in a good college; 20 years' experience; finest references; moderate salary. Apply N. N., Ph.D., Winfield, Kansas.

A VERY SUCCESSFUL TEACHER, having given up his position for the special study of Greek and German abroad, is open for an engagement. Would also teach Latin or History. Best references. PH.D., care of the *Nation*.

AN EXPERIENCED TEACHER DESIRES a position in a private school. Latin and English. Best references. RICHARD S. WALLIS,
Georgetown, Kent Co., Md.

"The book is quite as interesting as most novels."—THE OUTLOOK.

"It is of great interest, for it contains a plain, straightforward story of the Johannesburg revolt by one who saw what she describes."—N. Y. HERALD.

Rameau's Nephew.

A Translation from Diderot's Autographic Text.

By SYLVIA MARGARET HILL. Crown 8vo, $1.25.

*** In the Miscellaneous Essays, Vol. V., 'Diderot,' Carlyle says: "'Rameau's Nephew' . . . may pass for decidedly the best of all Diderot's compositions. It looks like a sibylline utterance from a heart all in fusion; no ephemeral thing (for it was written as a satire on Palissot) was ever more perennially treated. One day it must also be translated into English, but it will require to be done by 'head'; the common steam machinery will not properly suffice for it."

A Description of the Wordsworth and Coleridge Manuscripts

IN THE POSSESSION OF MR. T. NORTON LONGMAN.

Edited, with Notes, by W. HALE WHITE. With Facsimiles. 4to, $3.50.

Sold by booksellers. Sent, postpaid, on receipt of price.

LONGMANS, GREEN, & CO., Publishers, 91-93 Fifth Ave., New York.

The Nation.

NEW YORK, THURSDAY, JULY 15, 1897.

The Week.

The Senate has, following the House, taken its leap into the dark, and the cry of the leading Republican organ is, "For Heaven's sake, let the conference committee put some revenue duties into the bill!" What conference committees usually put into tariff bills is jobs, not revenue; but the confessed exigencies of the situation are certainly greater this year than ever before. Such ludicrously varying estimates of revenue were never before made by the different cooks that have been spoiling the broth. Mr. Dingley said his bill would produce $269,000,000. Not so, said Mr. Aldrich, it will produce only $159,000,000; and he added $23,000,000 more to get his total estimate of $182,000,000. Mr. Allison knocked off the $23,000,000, but still asserted, though with confessed qualms, that the bill would yield $180,000,000. The only apparent motive for his choosing that figure was the desire to show that the new bill would at least surpass the Wilson tariff, which produced in the last fiscal year $176,000,000 from customs duties. Even so, the bill as it passed the Senate being substantially the Dingley bill, Mr. Allison is at variance with Mr. Dingley in his estimates only a little matter of $89,000,000. The funniest thing of all is, however, that Mr. Dingley now agrees with Senator Allison, but he explains this as a result of the "delay" in the Senate's action. But he cannot save his reputation as an expert in that way. He committed himself to the prediction that the effect of delay beyond May 1 would be a loss of "$1,000,000 to $2,000,000 of revenue for each week." Calling it $2,000,000 a week, we have had a delay of not over ten weeks, which would mean a loss of $20,000,000, thus leaving $69,000,000 of the difference between Senator Allison and Mr. Dingley still unaccounted for, except on the theory that the latter did not know what he was talking about. The conclusion of the whole matter is that this "most scientific tariff bill ever constructed" is a hopeless mess as a revenue measure.

Secretary Gage has made a most impolitic proposition to prevent the Sugar Trust from getting a profit of $12,000,000 to $16,000,000 out of tariff legislation. It was highly indiscreet to call attention to this state of affairs at all. Everybody knew, of course, that the Trust was going to make $16,000,000, but why blurt it out? Has Mr. Gage no dread of the way this will sound on the Western stump? He feebly says that it is "only a business proposition" for the Government to take this money instead of the Trust. This could be done, no doubt, by an internal-revenue tax, as the Secretary proposes, but Congressmen see fatal objections to this course, though a plain business man would never dream of them. In the first place, it would cause more "delay"; it would be "contentious matter" which Senators would want to talk about. Besides, it is too late now. Why didn't Mr. Gage think of all this before? Furthermore, the sugar schedule is all settled, and the Trust had a majority of only two votes; who knows but it would turn round and defeat the whole bill if its profits were now to be threatened? Foolish Mr. Gage to stir up this question and imagine that "business propositions" were the thing to lay before Congress. It was a business proposition which Mr. Cleveland laid before Congress to save $16,000,000 in interest by writing the word "gold" in bonds, and the way that was hooted out of the halls of legislation should have been a warning against supposing that anything more of that kind would be welcome there.

At the present juncture in the coal-miners' strike the *Tribune's* Washington correspondent produces a theory that all the trouble lies in the Wilson tariff. "It was in December, 1893," he says, "that the Congress which framed the Wilson tariff law met, and the work upon the bill which reduced the coal tariff 35 cents per ton was begun. It was promised that that bill should take the entire duty off coal, and, as framed by the ways and means committee and passed by the House, it did place coal upon the free list. The Senate, however, restored a part of the duty on coal, making the rate 40 cents per ton, and the bill when it became a law reduced the tariff rate on bituminous coal by 35 cents a ton, the rate under the McKinley law having been 75 cents a ton." Turning to the statistical abstract of the United States for 1896, we find that in 1892, under the blessed McKinley tariff of 75 cents per ton, we imported 1,331,964 tons of bituminous coal, and that in no year since the Wilson tariff went into operation have we imported so large a quantity, the importation in 1896 having been only 1,243,000 tons. In the latter year, however, we exported 2,246,000 tons of bituminous and 1,394,000 tons of anthracite—3,640,000 tons in all, against 2,508,000 tons of both kinds under the blessed McKinley tariff. So it appears that the tariff worked the wrong way in both cases. It is a great mystery. The only treatise that can adequately explain it is Grosvenor's 'Does Protection Protect?'

The Senate committee on foreign affairs intimates that it has ready another "strong report" on the case of an American imprisoned in Cuba. This is intended to "force the President's hand," or, at the worst (and this is most likely), bring on another "lively Cuban debate." We certainly need another debate of that kind to steady the stock market and hurry up prosperity. It would be deadly to so much as whisper currency reform in the Senate—that might strangle prosperity in its very cradle; but a loud call for war is just what we need to restore confidence and raise wages. What we wonder at, however, is that it does not occur to the Senate to pay these Cuban indemnities out of its own undistributed Cuban money. There is still, we understand, some $40,000 on hand out of that $50,000 voted in the dark for the relief of Americans in Cuba. Our consuls have made heroic efforts to find the Americans and spend the $10,000 drawn by Consul-General Lee; they have "relieved" several of their own employees, with many native Cubans, and, in one case credibly reported, a Chinaman; but a large balance remains in spite of all they can do. Why not use this money to pay the indemnity to Richelieu and Bolton, whose claim Lodge wants the President to collect by force? Otherwise it may remain indefinitely unexpended, or even covered back into the Treasury—either alternative something frightful to think of in the case of public money.

An address to their American "compatriots" was some time ago adopted by the Hawaiian branches of the Sons of the American Revolution, the Sons of Veterans, and the Grand Army of the Republic, and is now published in this country. It is of interest as stating the arguments in favor of annexation in their boldest form. In the first place, San Francisco, Honolulu, and Unalaska form an equilateral triangle. We infer from this that whenever an equilateral triangle can be constructed having two of its angles in the United States, the third angle, according to the Monroe Doctrine, must necessarily be included within our territory. To the astrological reasons implied in "manifest destiny," we may now add those of a geometrical character which are not only more comprehensible but also more conclusive. In the second place, spectacular considerations demand that the United States should be in possession of the Sandwich Islands. Mr. Seward announced thirty years ago that the Pacific Ocean, with its shores, its islands, and "the vast regions beyond," was to become the chief theatre of events in the world's great hereafter. Of course, the Yankee race

will want to see this future show, and if Hawaii is going to furnish them front seats, the sooner they are engaged the better. No one can tell when the curtain will begin to rise on the world's great hereafter; but it must be said that the Pacific Ocean is not yet so interesting as the Atlantic and the surrounding countries. Thirdly, there has been a movement in Hawaii to abolish the contract system of labor, and introduce profit-sharing as well as the importation of industrious farmers from the United States, and the benevolent purposes of those engaged in this movement will be abandoned unless annexation is carried out. Finally, if the United States does not "grab" the islands, the Japanese will. They already outnumber the Americans greatly, they are increasing rapidly, they are fitted for the climate and its industries, and their destiny is so much more manifest than ours that it will prevail if we delay any longer. The presentation of these reasons should appeal forcibly to the sense of justice which distinguishes the American people.

The Iowa Democrats who believe in Democratic principles held a State convention last week, and put a ticket in the field for the November election. It is the first convention for such a purpose to meet since McKinley's inauguration, and it will deservedly attract the attention of the whole country. The end of the Presidential campaign left the Bryanites in full control of the Democratic machinery. The new managers have recently made the surrender to Populism complete by joining that organization and the "Silver Republicans" in the nomination of a fusion State ticket on the Chicago platform. No sooner was this done than the Democrats who possess convictions resolved to hold a convention and make a campaign for a ticket and a platform which would deserve their support. The gathering was held at Des Moines, and it was notable for the presence of men of principle from all parts of the State who have been leaders in their sections. The ticket nominated includes the names of two men who were elected by the Democrats as Railway Commissioner and Superintendent of Public Instruction four years ago, another who was the party's candidate for Governor two years ago, and a fourth who has been chosen a District Judge by the Democracy in the past. All five are men of approved Democracy, while of the five on the fusion ticket two have been Republicans and another a Populist. The Indianapolis platform of last year was the basis of the declaration of principles adopted.

The business men of Philadelphia are stirred up over the discovery of a characteristic exhibition of contempt for their interests by the "Government" of the State of Pennsylvania. For several months the Republican leaders in the Legislature talked about passing what was known as the "Bliss beer bill," but the matter dropped out of sight toward the end of the session. Since adjournment it has been discovered that, during the closing hours, after three readings and final passage in the House and two readings in the Senate of the "Bliss beer bill," the measure was completely and radically altered, so as to change it from a bill providing for the imposition of a tax upon beer, ale, and porter to one imposing a mercantile license tax, enormously in excess of the present tax, and inflicting upon the merchants of the State a serious burden, without giving the class affected an opportunity to be heard. The bill was not even brought to the notice of Philadelphia merchants until it had passed the Legislature and was in the hands of the Governor. Representatives of twenty-five commercial organizations have held a meeting to petition him to veto it, "thus preventing the imposition upon our merchants of a burden which would seriously cripple them, if not drive some of them out of business."

This was all very well, but will these protesters, members of the dominant party, seize the chance to prove their sincerity? Senator Quay has announced that he will be a candidate for reëlection, and from this time until the Legislature shall ballot for the office a year from next winter, he will direct his energies towards securing another term. It rests with the business men of the State to decide whether he shall succeed. It is they who are chiefly responsible for the existing situation in Pennsylvania, for, as ex-Postmaster Field of Philadelphia said in his speech the other day, they "have committed the great interests of this State into the hands of a single individual." Will they commit those interests to the same hands again? Apparently they will. One of Quay's henchmen, State-Senator Durham, says that he has no doubt that the Senator will be triumphantly reëlected, and the Philadelphia *Ledger* says that "there is no apparent reason why any one else should have doubts upon the subject."

The Georgia Bar Association, after disposing of those lawyers who defended lynchings, took some positive action towards securing reforms in methods of procedure which will remove abuses that have often provoked the people to violence. Resolutions were adopted which declared it to be the sense of the association that criminal pleadings should be amendable, that the State and the defendant should be upon an equality in the challenges of jurors, and that prisoners who desire to make any statements on their own behalf should do so under oath and subject to cross-examination. The President was authorized to appoint a committee of nine to urge the adoption by the next Legislature of bills embodying these principles, and to present to the Association at its next meeting a report covering the whole subject of needed reforms in the criminal law and its administration. The press of Georgia has long urged the necessity of such action as this on the part of the lawyers, and the profession in other States may well imitate the example.

The decision of Justice Chester that the statute passed at the last session of the New York Legislature, known as the "Anti-Trust law," is unconstitutional. while not final, is very convincing in its reasoning. That statute was intended to correct the evils, or supposed evils, of combinations in restraint of trade by establishing altogether new methods of criminal procedure. It has been one of the distinguishing features of English jurisprudence that no one should be compelled to incriminate himself, or to give testimony tending to subject himself to penalties or forfeitures. This principle is recognized by the Constitution of the United States, and by the Constitution of New York, and has been generally supposed to rest upon an unquestionable basis of justice and expediency. While it may sometimes result in the escape of the guilty, it so clearly tends to protect the defenceless against oppression that few writers on jurisprudence have not given it their hearty approval. Apparently moved by the idea that trade combinations were beyond the reach of the established system of administering justice, the New York Legislature provided that no person should be excused from answering any question put to him in a proceeding under the statute in question on the ground that his answer might tend to prove him guilty of a misdemeanor as defined in that statute. With a view to avoid the constitutional provision, the statute further provided that the testimony given by a witness should not be used against him in a criminal proceeding, and that no criminal action should be brought against him on account of such testimony. As Justice Chester says, this would protect the witness against a prosecution for giving perjured testimony, but it would not protect him against prosecution for a violation of the statute disclosed by means of the testimony that he had been forced to give. "The act contains no immunity from prosecution of the witnesses for the crime which is sought to be discovered by the examination, and the discovery of which is the chief purpose of the examination."

The second ground on which the act

is held unconstitutional is more technical, but hardly less important. The procedure introduced imposes non-judicial functions on the courts, and thus violates the fundamental principle of the separation of the powers of government. The Attorney-General is empowered to call on a justice of the Supreme Court to assist him in discovering evidence. The justice has no function to perform in such a proceeding except that of a commissioner under letters rogatory. "There is no cross-examination of the witnesses; the testimony, if it can properly be called such, could not be used in an action or in any proceeding, and the application leads to no judgment or determination of the court." Such duties Justice Chester considers to be not judicial, but merely ancillary or auxiliary to the Attorney-General in the discharge of his functions, and as therefore not constitutionally devolved on the Supreme Court. So far as the substantive provisions of the act are concerned, Justice Chester intimates that they may be constitutional, for the reason that they simply reiterate the common and statute law on the subject of combinations in restraint of trade.

Those glowing predictions in the *National Review* of what England would do for silver, which were cabled to this country a fortnight ago, turn out to be, as we suspected, little more than the editor's fancy at work. He says he "should gather" from M. Méline's speech that the French Premier would do so and so, and that he "believes" the British bimetallists to be able to compel the Government to do this and that; also "our readers may take it from us" that the Indian mints will be reopened, etc. All this qualifying guess-work was left out in the despatches, as was also the editor's admission that "public opinion in England is not ripe" for coining silver at a fixed ratio with gold; in other words, the international bimetallists are fooling themselves if they think they are going to get anything from England. But the *Review* says one thing which there is no gainsaying. Referring to the rumors that President McKinley intends to do something to establish the United States more securely on the gold standard, it observes:

> "It would be difficult to conceive anything more absurd than that the President of the United States should accredit three Special Envoys to the heads of the chief foreign governments for the express purpose of negotiating a bimetallic settlement, and meanwhile depute his Secretary of the Treasury to take the necessary steps for establishing his country on a monometallic gold basis. There never has been such double dealing as between nation and nation, and there never could be, and President McKinley is the last man in the world to lay himself open to such vile insinuations."

This is the simple truth. Nothing could be more absurd than the bimetallic Special Envoys if the Administration is really for the gold standard. Somebody is being tricked—either the bimetallists or the sound-money men.

It should make little difference to England whether the seal question is formally reopened or not, for in some form or other it has been an open question ever since Mr. Blaine declared that it was *contra bonos mores* to kill seals unnecessarily. We doubt if any government in the world has ever shown such a determined disposition to do its duty in its foreign relations as ours has in the case of the seals. The case is all the more significant of our attitude because the court of arbitration, to which we got the matter referred, decided at the outset that "the United States have no right to the protection of or property in the seals frequenting the islands of the United States in Bering Sea when the same are found outside the ordinary three-mile limit." Nevertheless, we at the same time got the court to provide for joint fishing-regulations and a close season, established by elaborate rules, binding on fishermen of the United States and Great Britain and supervised by the governments of those countries. Such a police as this is a matter of daily and hourly regulation, and hence if we insist, as we do, that it is not effective, there is no reason why the expiration of the term of five years provided by the court for a reëxamination of the rules, should be waited for. England may say, "We will not reopen till the five years have elapsed"; to this no one can ever prevent us from replying, "You ought to reopen because the evidence shows that the police regulations are not effective." The fact is that the question is open; the difficulty is to close it.

The debate in the French Chamber of Deputies over the renewal of the charter of the Bank has already occupied many weeks, and is far from its conclusion. It has taken a very wide range, and many subjects not on their face germane have been touched upon. Some of them, however, have aroused discussions concerning questions of world-wide importance, not the least interesting of which is the status of the funds of the Bank under established principles of international law. In general, it may be said, war is regarded as carried on by one state or government against another, and not as waged between the individual citizens of the hostile states. Thus, at the beginning of the war of 1870, King William announced that the war was to be waged against French soldiers, not against French citizens, whose lives and property would be protected so long as they did not engage in hostilities against the German forces. In pursuance of this policy, Prince Frederick William ordered the restitution of the funds of the branch of the Bank at Rheims, which had been confiscated by an over-zealous German officer on the capture of that town. This officer assumed that these funds were the property of the French Government, but Frederick William declared that the branch bank was a private institution, and that as such, unless its funds were intended to support the French army, they were exempt from seizure. A still more significant episode occurred at Strasbourg. On the capture of that town by Gen. Werder, the vaults of the branch bank were broken open, the cashier refusing to produce the keys, and the contents were sequestrated. They amounted to 10,000,000 fr., of which 6,000,000 fr. was in bags, ticketed, "At the disposition of the General Treasury." These moneys were transferred to the custody of the Bank of Prussia, but the Bank of France at once claimed them. The matter was referred to the historian Von Sybel, who admitted that the Prussian Government had no right to the property of the Bank of France; but he insisted that money marked as belonging to the French Treasury was properly the subject of prize. On the other hand, M. Robert of the Bank of France maintained that, in the case of personal property, possession determined ownership, and that as the 6,000,000 fr. were in the hands of the Bank of France, they were at law its property. This position was finally sustained by a special article in the treaty of Frankfort, and the confiscated money was repaid to the Bank of France.

The bearing of these incidents on the present proposals of the French Socialists is very plain. They are doing all they can to convert the Bank into a state institution, and if they succeed they will necessarily expose its immense treasures to the fortunes of war. That these treasures would be used by the French Government, if it owned the Bank, is not a circumstance that would discourage the Socialists; but even they may be inclined to hesitate before taking a step that might put these vast resources at the disposal of a hostile Power. Possibilities of this character were considered in 1889, when the constitution of the Bank of Germany was debated; and the whole question was investigated recently in Switzerland, where a law establishing a state bank was rejected by the referendum. In the debate in the Reichstag, M. Thiers's declaration, that if the Bank of France saved the country, it was because it was not a state bank, was quoted with approval, and it was because of the possibilities of war that great care was taken to give the Reichsbank the character of a private institution. It is of the essence of socialism to despise the warnings of the past, but the magnitude of the danger that may be incurred in this instance is sufficient to daunt the most reckless fanatic.

THE SENATORIAL VETO.

Many truths and powers latent in the Constitution have been brought to light and put in action during the tariff debates in the Senate, and not the least important of them is the senatorial veto. This is a grant of power not expressly made in the Constitution; it comes under the head of "implied powers," perhaps, or is involved in the "general-welfare" clause, it may be. Indeed, it is difficult to see how the right of senatorial veto could be reduced to precise terms in writing at all. It is essentially a vague, a shifting, a will-o'-the-wisp right, now apparently vested in this person, now in that, never quite the same thing at two different times. Doubtless it would have been put in the Constitution if the framers had known how to do it; and so, applying the great legal (or Jesuitical, we forget which) "doctrine of intention," we may say that the senatorial veto is, or should be, one of our most cherished constitutional rights, privileges, ægises, and palladia.

The particular senatorial veto to which we refer should not be confused with other varieties. It is wholly distinct from the senatorial veto on the President's appointments to office. The latter right being now so well recognized, being accepted and acted upon by Mr. McKinley, whom some foolish people thought to be himself in possession of the veto power, surely needs no further arguing with intelligent people. Nor do we allude to the veto which the Senate may exercise on ill-judged treaties looking to peace and civilization. It is well known that, as Selden said the whole divine sanction of the decision of a general council rested in "the odd man" whose vote carried it, so the right of making treaties really rests, not in the President, but in the one man in the Senate over or under a two-thirds vote. No, the new senatorial veto we have in mind is one relating particularly to legislation, more narrowly to tariff legislation, closer still to tariff legislation openly and weightily affecting private interests.

Examples being always the best definitions, we will show this senatorial veto in actual exercise. The Senate finance committee proposed an increased tax on beer. This appeared to be wholly within their constitutional rights, and the tax looked very pretty on paper, promising a snug revenue. But the committee had omited to look into Story on the 'Conflict of Laws,' and so had forgotten the fact that the right to veto a tax on beer was vested in Senator Platt. Thus he was compelled to go to them and tell them that he was very sorry, that he wanted revenue as badly as any of them, but that really this was his affair, and his own oath of office and the oaths of the brewers would not permit him to approve of this tax. The committee saw that they had run up against a senatorial veto, and gracefully withdrew the tax.

Many other cases could be cited of the use of this veto. All of them were not in open Senate. To make it as easy as possible for the committee, vetoing Senators used often to go to them at dead of night and beg them not to force a veto, under unpleasant circumstances, in public. There seems also to be a species of the senatorial veto closely allied to what the commentators call, in the case of the President, the "pocket veto," though it seems to be something else than a bill (of Congress; we cannot vouch for the legal-tender kind) that is, in this instance, put in the pocket. But, in spite of all that kindness and forethought could do, the finance committee had often to be vetoed in the full light of day. Again and again Senators had to rise with a pained air and say, "The committee appear to have overlooked my right to veto taxes on soda-ash [or silk handkerchiefs, or pineapples, or white pine, as the case may be]. Far be it from me to keep the spindles from singing again, but I must draw the line here. The committee may tax anything else they please, from argols to Zante currants, and never a murmur will they hear from me; but this tax is a blow at my privileges, and I stand here to say that I never receive a blow without paying it back with interest. So I must return the bill to the committee without my approval."

A tabulation of articles as to which various Senators hold the right of veto would be of great value. It would be an indispensable guide to the framers of the next tariff. If they could know in advance what taxes would be vetoed, by what Senators, they could make a great saving of time and temper. As the list of vetoable taxes is rapidly extending, the time should not be far distant when we can have no tariff at all, as some Senator will be found to veto every item of it. This would leave us rather worse off for revenue than we are now, but it would establish the senatorial veto as thoroughly constitutional. The Washington correspondents, it seems to us, have been neglectful in not compiling a tariff classification of this sort. The form should be something like this:

Article.	Veto vested in
1. Beer	Tom Platt.
2. Soda-ash	Orville Platt.
3. Pineapples ..	Mat. Quay.
4. White pine ..	Spooner-McMillan, ½ vote each.

Carried out through the entire tariff, such a tabulation would be simply invaluable. It would be instructive, too, and fit to do fine work in a campaign of education, if we ever have another. Moreover, it would show how great a triumph it is for Senator Allison to have actually carried a bill over, not one veto, but ninety vetoes, including his own. The vetoes have, to be sure, knocked all the revenue out of the bill, but there is the bill, and it is more than doubtful if the Senate has a constitutional right to raise revenue anyhow.

ANARCHY.

President McKinley's surrender has now become an abdication. He has finally divested himself of his last remaining constitutional power, and the country is practically without a President. Like a Merovingian king, he retains the semblance of a ruler, but really holds office only to sign the decrees which other men impose upon him. He is a highly respectable figure-head; he is an excellent royal-progress kind of Chief Magistrate, travelling about to lay corner-stones and wish his people prosperity; but a President in the constitutional sense—a President of independent initiative, jealous of his prerogative, direct representative of the people—he is not.

Four short months have seen him strip away one power after another of his great office, and throw it to the clamorous bosses. First came the surrender of his constitutional power to "appoint . . . . officers of the United States." He is now simply a pen to sign the commissions which Senators thrust in his face. Next came his abandonment of the power "to make treaties." The Hawaiian treaty was not made by the President, but by a clique of bargaining Senators. Finally, he has given up the right to "recommend to Congress such measures as he shall judge necessary and expedient." Congressmen visited him on Thursday, and demanded the surrender of this Presidential function. Mr. McKinley turned it over without a murmur. He prefers to have the country know that he is but the simulacrum of a President.

His retreat on the currency question was most undisguised and cowardly. It was no mere rumor that he was proposing to send a message to Congress urging a first step towards currency reform. There was a formal cabinet meeting. It was formally decided by the President and his official advisers that a message should be sent. The message was actually prepared. The Secretary of the Treasury gave out a glowing interview about it. Anxious friends of sound money were saying, "At last!" Suddenly all was changed. A hurried visit of Congressmen to the White House led to the announcement that the President would hold back his message and probably not send it at all.

No secret is made of what was back of all this. Simply another shameful bargain had been struck to save the tariff. Here is the *Tribune's* unblushing account of the intrigue:

"It is known that the Republican managers in the Senate agreed three weeks ago not to press any measure providing for a

currency commission at the present session. The promise was made at a time when the fate of the tariff bill was by no means certain, and when it was in the power of the Opposition at least to delay action on that measure indefinitely. The agreement provided that there should be no effort on the part of the opponents of the tariff bill to delay action unnecessarily, and that the Republicans should not urge the currency-commission scheme at the present session, even if the President should send in a message recommending such a commission."

And the *Tribune's* cynical comment on the whole disgraceful transaction is that the message would not have amounted to anything, even if it had been sent, as it was intended only as "a soothing dose for inflamed nerves"!

We seem to remember that the *Tribune's* nerves were somewhat inflamed, along with those of the rest of the community, when the great fight for sound money and the nation's honor was waging last summer. We have not forgotten, if others have, the appeals, the promises which were made in Mr. McKinley's name. He asked for and received the support of thousands of Democrats and tens of thousands of Independents, on the ground that he would move speedily and vigorously for a reform of our vicious currency system. As late as in his inaugural address he made fair promises on this subject. Now, at the first fire—before the first fire—at a mere hint—he runs away. It is a fearful blow, not to his own prestige—that is hopelessly broken—but to the whole cause of currency reform. If Senators can veto a message now, they can next December. The silverites control the situation, and they control it just as they did in 1890—through a wicked betrayal. Dead currency reform is the price paid for the tariff of 1897, as the silver profligacy was for the tariff of 1890. And the men who made Mr. McKinley President are taunted, in the face of this monstrous treachery, with being victims of "inflamed nerves"!

But there is something deeper and worse in all this than the fate of any particular message or measure. It signifies that constitutional government has ceased to exist at Washington. No organ or exponent of the popular will now remains there. If it were simply the fact that Congress had become supreme, and that the President had consented to be effaced, the situation would be deplorable. Congress has undoubtedly been pushing its usurpation of power during the past twenty years. The secret of its ferocious hostility to Mr. Cleveland was more than personal—it was due to its perception that in him a rugged and outspoken opponent of its unconstitutional pretensions had been found. He excited the wild rage of Congress not so much by what he did, as by the fact that he dared to do anything independently. Mr. McKinley has changed all that. He and Congress are harmoniously at one, but Congress is the one. Harmony is always attainable by surrender, and the President has now not only surrendered, but abdicated.

This of itself, we say, would be most deplorable and alarming. But the desperate nature of the situation is fully seen only when we consider the fact that it is not Congress, but the clique of bosses in control of Congress, that is now supreme. What are the Republican Representatives from New York, Pennsylvania, and Ohio but so many puppets in the hands of Platt, Quay, and Hanna? What does the Republican caucus in either House or Senate register but the decree of these men and their fellow-conspirators? That is what our representative system has come to in practical operation. By denying the people the right to nominate, by blackmail and intimidation, a group of political bosses has been enabled to bestride Congress. And it is to them, not to Congress, that the President is really surrendering his constitutional rights and powers. It was Quay—not on the finance committee, not on the conference committee, having nothing to do directly with the fate of either tariff or currency—it was Quay who went to the White House and told the President his message must not be sent. Of course, the American people have got to find some way of restoring their government. But they will have to get along without Mr. McKinley's help. He has extinguished himself.

REACTION.

The Republican party has always posed as the especial friend of civil-service reform. In the first national convention after the passage of the act of 1883 it declared that this reform had been "auspiciously begun under the Republican administration," and advocated its completion "by the further extension of the system to all the grades of the service to which it is applicable," as well as the observance of "the spirit and purpose of the reform in all executive appointments." In the convention of 1888 this declaration was readopted, with a contemptuous allusion to the desertion of the reform cause by those who had abandoned the Republican party in 1884, and with the boast that "we will not fail to keep our pledges because they have broken theirs, or because their candidate [Cleveland] has broken his." The platform of 1892 commended "the spirit and evidence of reform in the civil service [under Harrison], and the wise and consistent enforcement by the Republican party of the laws regulating the same."

The Republican national convention of 1896 "pointed with pride" to the party's share in promoting civil-service reform, and committed the organization anew to the further extension of the merit system. This was the brief but comprehensive declaration on the subject:

"The civil-service law was placed on the statute-book by the Republican party, which has always sustained it, and we renew our repeated declarations that it shall be thoroughly and honestly enforced and extended wherever practicable."

The candidate nominated upon this platform had been a supporter of the reform while he was in Congress. As "leader of the House" in 1890, he had opposed an attempt by Republican spoilsmen to "starve out" the commission by refusing any appropriation for its expenses; had expressed his "regret that the committee on appropriations did not give to the commission all the appropriation that was asked for, for the improvement and extension of the system"; and had declared that "the Republican party must take no backward step," because "the merit system is here, and it is here to stay, and we may just as well understand and accept it now." Six years later, in accepting his nomination for the Presidency, Mr. McKinley pledged himself thus solemnly to maintain and extend the reform:

"The pledge of the Republican national convention that our civil-service laws 'shall be sustained and thoroughly and honestly enforced and extended wherever practicable,' is in keeping with the position of the party for the last twenty-four years, and will be faithfully observed. Our opponents decry these reforms. They appear willing to abandon all the advantages gained, after so many years' agitation and effort. They encourage a return to methods of party favoritism which both parties have often denounced, that experience has condemned, and that the people have repeatedly disapproved. The Republican party earnestly opposes this reactionary and entirely unjustifiable policy. It will take no backward step upon this question. It will seek to improve, but never degrade, the public service."

The professedly "authoritative" announcement has been made from Washington, by the chief organ of the Administration, that "important modifications of the civil-service rules will be made by the President at an early day," which will exempt from competition the employees of the Government Printing-Office; deputy collectors, and other minor employees of the internal-revenue service; the sub-officials and employees of federal marshals and district attorneys; and probably also "the chiefs of divisions and chiefs of bureaus, and so forth." The impending "modifications" are reported by the *Tribune's* correspondent as likely to take effect on or about the 20th of July.

It would be hard to exaggerate the seriousness of the proposed changes. The "modifications" outlined would be a step very far backward. Hitherto, under Arthur, Cleveland, Harrison, and Cleveland again, each administration has extended the scope of the merit system. The gains made during Mr. Cleveland's second term were the most important of all. The bringing of the deputy collectors and minor employees in the internal-revenue service within the classified service had been strongly recommended

by a Republican Civil-Service Commission while Mr. Roosevelt was at its head; the extension of the reform system to cover chiefs of division and other similar officials had been expressly and repeatedly urged by Mr. Roosvelt; the inclusion of the Government Printing-Office in the classified service had been long advocated by Republican reformers. Experience has vindicated every extension of the reform, and disproved all the charges made by its opponents.

Every excuse which has been put forward to justify the President's alleged intention to break into the classified service and restore something like 5,000 places to the disposition of the spoilsmen, is based on falsehood. Mr. McAneny, Secretary of the National Civil-Service Reform League, has shown this in two letters published last week in the *Evening Post*. If, in the face of these letters, President McKinley and Secretary Gage carry out the plans attributed to them, they will do so with full knowledge of what their acts mean. They will be taking the first retrograde step which any administration has taken since the classified service was established under President Arthur in January, 1883. From that date to the present time there has been a steady and unbroken progress onward, each successive administration extending the classified service until its membership, which was 15,000 under President Arthur, had been swelled to nearly 90,000 when President McKinley entered upon office, leaving less than 800 places outside civil-service rules.

"The large inclusions," says the *Tribune's* "authoritative statement," "embracing some of the best-paying places, which were made in the last few months of Mr. Cleveland's administration, were clearly of a partisan nature, and not in the line of civil-service reform. Restoring them cannot injure the cause of reform. On the contrary, the rebuke administered to partisan Democracy by their reinclusion in the list of appointive offices will be an efficient factor in the genuine reforms instituted by President McKinley."

There is not one word of truth in this justification. The employees of the Government Printing-Office were placed in the classified service in June, 1895, at the request of the Public Printer. The clerks, storekeepers, and gaugers in the internal-revenue service were classified in December, 1894, and the deputy collectors in May, 1896, mainly through the efforts of Theodore Roosevelt. The subofficers and employees in the marshals' and district attorneys' offices were classified in May, 1896. There were no orders issued "in the last few months of Mr. Cleveland's administration," nor were there, as the *Tribune* also charges, any "midnight orders" issued either in the "last months" of the Cleveland administration or at any other time. This is the favorite lie of the spoilsmen, harped on with especial emphasis by Senator Gallinger of New Hampshire. The latest order issued by President Cleveland was dated May 6, 1896, long before the nominating conventions of last year's Presidential campaign were held, and consequently months before any one could have foreseen the result of the election in the following November. The other lie, which invariably accompanies this one, is that the various orders which President Cleveland issued swept into the classified service a "great army of partisan Democrats." The facts are, as shown by the records, that there are today more Republicans than Democrats in all branches of the service.

The true spirit of these assaults upon the classified service is revealed in this passage from the *Tribune's* "authoritative" statement: "The President is not a dreamer or a doctrinaire. With the eye of a practical statesman—one devoted at all times to the cause of civil-service reform—he has studied since his election what should be done to make the service what it ought to be." That is precisely the language which Gov. Black used in defence of his plans for "taking the starch out of the civil service." He is not a "dreamer or a doctrinaire," and he approaches the law with the "eye of a practical statesman." So do Platt and Quay and all the other despisers of "dreamers and doctrinaires." Mr. McKinley did not speak about the law and the reform in these terms when he made his pledge in his letter of acceptance; neither did such language about them find its way into the platform upon which he stood, nor has it ever found its way into any Republican platform. The party is in power now, and its bosses are demanding more spoils than are accessible. These demands can be met only by breaking into the classified service, and hence the President's preparing to make the assault.

POOLS, TRUSTS, AND MONOPOLIES

There is one point connected with the crusade against capital that has been raging for the past year which seems to have attracted little attention, yet which lies at the heart of the matter—what system would the reformers substitute for the existing arrangement? Debs and the Populists, of course, know what they want; the former is quoted as saying last week that inasmuch as under the present régime capitalists can get no profits, and labor can get no wages, the only way for industry to make any advance is for the whole to be worked by the State for joint account, after which he thinks that the troubles would disappear. This semi-insane declaration is only a burlesque of the actual ideas which underlie the populistic movement.

We do not refer to those ideas, but rather to the whole scheme of criminal legislation against Trusts and monopolies, federal and State, which has all been enacted within a few years at the demand of agitators, and which forms a totally new page in our criminal code. Those who pass and apply such statutes must have, one would think, some idea of what would or might take the place of the vast network of charters, Trusts, contracts, and pools through which capital now operates the agencies of trade and commerce. They can hardly suppose that treating the whole present arrangement as a mass of crime will answer; even if you can both indict a whole community, or a whole generation, and also convict it, the evil is scotched, not killed. You must have some system in mind which is to take the place of what you would destroy.

This is a question which particularly addresses itself to the minds of judges who have to look into these new laws, because criminal legislation is all based on the idea of a possible alternative. It is idle to make offences out of acts which are necessary, and hence the first question underlying the whole debate about Trusts, pools, monopolies, and contracts in restraint of trade is not merely whether they produce inconvenience, now and then enrich men whom we should prefer to see poor, or impoverish men whom we should like to see rich—these consequences have attended the progress of civilization since the dawn of history—but whether pools, Trusts, monopolies, and contracts in restraint of trade are not really a necessary part of our civilization, which cannot be superseded without the disappearance of civilization itself.

Strangely enough, although this matter is vitally involved in our system of constitutional law, it has not yet been thoroughly discussed in this country. Next autumn it will come before the courts in a variety of forms, notably in the argument of the Joint Traffic case before the Supreme Court at Washington. It has, however, been canvassed in England in a great judicial argument, to the full importance of which Mr. W. L. Royall of the Richmond and New York bars invites attention in a pamphlet called 'The Pool and the Trust; Their Side of the Case.' The English case was not a criminal proceeding, although it would have been in this country, but it involved a discussion of the "policy" underlying all interference by the courts with contracts.

The facts were much blacker from the anti-monopolists' point of view than any involved in the trans-Missouri case or in the recent cigarette trial in this city. We give them in Mr. Royall's own words:

"Several lines of steamships traded to China all the year. The trade was unprofitable, except in the so-called 'tea season,' when it was very profitable. The losses of the year were made up and a profit gained by the freights on tea in 'tea season.' Another line of steamers traded to Australia all the year until 'tea season' came on, when its steamers were diverted to Hankow

to get a part of the profitable tea trade. The lines which traded to China all the year entered, thereupon, into an agreement, called there a conference, which was in all essentials one of our 'Trusts,' or 'pools,' or 'monopolies,' or 'boycotts,' or 'contracts in restraint of trade,' or whatever else of the same sort can be suggested. They agreed together to divide out freights among themselves, and they published a notice to all merchants in China that if they would ship everything all the year by one of the conference lines, they would be allowed a rebate from all freights at the end of the year of 5 per cent., and whenever one of the steamers of the Australian line came to Hankow the conference had a steamer there to underbid it on freights; so that whatever the Australian got caused it a loss. Thereupon the Australian line applied to the English courts for protection, upon the ground that this combination of many against one was contrary to the principles of our laws."

Now all the English judges but one, from the trial court up to the House of Lords, sustained the agreement, and they sustained it on the ground that they could not help themselves. "It is not illegal," Lord Morris said, "for a trader to aim at driving a competitor out of trade, provided the motive be his own gain by appropriation of the trade." And it is clear from the case, as Mr. Royall very justly says, that "the alternative idea, which turns courts loose to judge of the validity or invalidity of each particular agreement accordingly as the judge may think it is in harmony or out of harmony with his ideas of public policy, leaves the question of the citizen's rights to the discretion, and the arbitrary discretion, of a judge." This is really the alternative. And if we extend the principle to this country, and imagine the present crusade successful, we should find that our substitute for our present commercial system was the despotism either of court or Legislature.

The trans-Missouri case and Judge Peckham's opinion in it were a perfect illustration. All contracts, he declares, "in restraint of trade" are illegal, because the Legislature has said so. It may be reasonable, or unreasonable, enforceable or unenforceable, but the rule is final. The English case just referred to was, we believe, quoted in the argument, but it made no more impression on him and the majority judges than if it had been blank paper, evidently because the idea is firmly lodged in their minds that arbitrary edicts or decisions are to be substituted in these matters for the free rules of the common law which have made our civilization what it is to-day. Of course, this is only the first step. The last would be the reintroduction of the old despotic control of trade by Government under which free competition would disappear, and the right to buy and sell and manufacture and exchange would become again privileges granted and sold by the Government. Is it possible that we have forgotten already that it was by Government that "monopolies" were introduced, and by freedom not only in competition, but in combination, that they were destroyed?

LONDON DECORATED.

LONDON, June 24, 1897.

So much has been written about the Jubilee that one hesitates to add to the columns of special reports and correspondence on the subject. And yet there is a certain aspect of the celebration to which little reference has been made, though it is distinctly interesting enough not to be passed unnoticed. From the political, sentimental, personal, domestic standpoint, everything that could be has been said. But, while even our own "Greatest Show on Earth" never drew such crowds as the spectacle of London's streets decorated, almost everybody has been content to stare and maintain a discreet silence. There have been only a very few bold voices to tell the truth, aloud and without fear, and to pronounce the decorations abominable.

It might be suggested that the abomination was merely what was to be expected—was merely in keeping with Victorian taste: a fitting tribute to the period commemorated. But it must not be forgotten that the English artist is supposed to have changed all this, and it is really because one has heard lately from all sides of his admirable achievement in the decorative arts that the amazing display London has been making of itself seems the more significant. Within recent years, has it not been to England that the designers and decorators of the Continent and of America have been turning for inspiration? The Salon de l'Art Nouveau in Paris depends upon English Arts- and Craftsmen for its chief attractions. Belgians adorn their houses with bewildering exaggerations of English models. Germany sends enthusiasts to spy out the new Promised Land. The name of Morris is a household word everywhere, and the *Studio* has become the universal organ of artist, art student, and amateur. Nor is the Englishman too modest to admit and glory in the proud position he holds as decorator. It may be that to many an unknown, nameless artisan from abroad he owes the beauty of his old cathedrals; it may be that to Van Dyck and Rubens he must attribute the greatness of the greatest school of English painters; it may be that for the Chippendale chair, the Sheraton table, the Adams mantle, that now make the fortune of the dealer in antiquities, he is indebted to France. But to-day, at last, does he not boast that it is he who sets the standard of decoration for the world? And, as his Arts and Crafts Exhibitions explain, there is not a branch of the ornamental arts which he has not had the time and the ambition to study and develop. Nor does his activity cease here. Technical schools have multiplied in order that among the many as well as the few taste may be cultivated, the early Victorian errors rectified. South Kensington spreads its schools in all directions. The County Council has its art advisers and art classes, and, indeed, at the very moment that London was adorning itself for the feast, I am told that a technical congress, within sound of the decorator's hammer, was calmly and solemnly discussing the beautifying of cities.

And now consider the use London has made of the first great opportunity to prove its decorative powers—for the decoration of a city gives wider scope to the artist than the ornamentation of a single house. An imperial pageant, surely, offers fewer restrictions than the domestic stage. And there was plenty of time for preparation: long months to evolve and perfect a scheme, long weeks to carry it out. Moreover, there was wealth and to spare—money pouring like water into the capacious pockets of builder, contractor, and decorator. Finally, there was a fine background waiting; one, it is true, without the classic elegance of Paris, without the flamboyant color and warmth of Rome or Seville, but still a background with a certain dignity and impressiveness, with a richness and mystery of which the thick London atmosphere holds the secret. When, more than a month before the appointed day, London began to turn itself into a hideous labyrinth of scaffolding and steps; when Trafalgar Square—"the finest site in Europe"—became for the time a huge carpenter's shop; when the National Gallery, the beautiful churches of the Strand, St. Paul's, gradually disappeared behind a network of poles and planks, one bore it in patience, even though one lived in the very midst of the colossal confusion, reserving one's criticism until the builder had been replaced by the decorator.

The decorator appearing, his first care was to put up a sign announcing himself. He came from Tottenham Court Road, from Westbourne Grove, from Oxford Street, from Pall Mall—from a shop, not a studio; the task was in the hands of tradesmen, not artists. And with the first touches of color on the bare wooden structures, the first suggestions of ornament, it was clear that each was working for himself alone, without thought of his neighbor. The Londoner was carrying the English love of personal liberty even into his manner of receiving the Queen. Where principles are at stake, what matter if discord be the result? Paris, little more than a year ago, gave a reminder of the stateliness and splendor with which a great capital can decorate itself on a state occasion. There, authorities did not put their confidence in chance, but in a general scheme of decoration. In London there was absolutely no scheme. The artist was not consulted, so far as I can find out, save in a solitary instance, and then by no means to his credit. Mr. Legros designed a large allegorical group—"Great Britain, Labor, and Commerce"—for the front of the Bank of England; but whether he was hindered by the nature of the commission, or whether he was unused to open-air conditions, certainly the design, when in place, was dull and uninteresting in color, and no more effective than the scene painter's devices for a theatrical spectacle. Elsewhere, however, with two or three notable exceptions, the loyal Londoner relied chiefly upon red bunting, the old familiar V. R., the thistles and symbols that have done duty for so many countless royal birthdays and weddings, ugly little clusters of glass globes, cheap, dreadful portraits of the Queen, all stuck up here and there and everywhere, according to the convenience of the contractor. Beauty, apparently, was left out of the reckoning, except at the *Daily Telegraph* office—its effort deserves to be recorded—which embowered itself in palms, and greens, and purple orchids, and at one of the Pall Mall clubs, which relied also upon fresh flowers and a fine arrangement of flags—among them the Confederate flag waving gayly.

Nor was the mere gorgeousness, beautiful or otherwise, the occasion seemed to demand, taken into consideration. The Baron-

ess Burdett-Coutts made one brave effort with a regal arrangement of purple velvet curtains and gilded columns that disguised the bare ugliness of her Piccadilly mansion. But, for the rest, as a rule, cheapness struck the keynote. And matters were not improved when the City and the different vestries vied with each other in their efforts to disfigure the streets. Across Piccadilly were strung lines of dangling glasses, suggestive of the rows of bottles in a cheap shooting-gallery. The Strand was bridged over by a series of strange erections bearing what looked like red, green, and yellow toy balloons and money-lenders' signs, as primitive and barbaric in design as any ornament you could hope to find in a Central African village. In Fleet Street garlands of artificial flowers and greens swung from purple pillars. Up Ludgate Hill stretched a line of gallows-shaped columns, from which were suspended dried palm leaves, while above each rose a Japanese fan rampant.

So one might go on, describing the marvels of the route. From end to end, the artlessness of the display was simply incredible, though there is a rumor that for the little that was done by the authorities Paris was, in a measure, responsible. But if it be true, as is said, that some of the Jubilee street decorations had already served on the other side of the Channel to welcome the Czar, then in Paris they must have been arranged to far better purpose. London, arrayed in gala dress for the mightiest ceremonial it has been its privilege to hold for many a year, seemed to have borrowed the cheap finery of the travelling show or the country fair. There were places, indeed, where you had but to strew sawdust along the street to imagine yourself in the circus-ring. The wealthiest city in the world, the city that to-day pretends to set a decorative example to two continents, could not vie with the quietest little French town when it makes the feast solely for its own pleasure and delectation. Why, if nothing had been done until the last moment, and if then the City Companies had hung out some of their tapestries and banners, the spectacle would have been worthy of the reception of a Queen and Empress, on her way to return thanks for the sixty years of peace and prosperity her reign has secured to her people.

But really, the fiasco of the decorations—that is, of course, artistically—is the more unpardonable because of the money and material at the command of the people who prepared them. In the procession itself there was the same waste, the same failure to make the most of things. No one has denied that as a pageant it was a disappointment, imperial triumph as it proved from the loyal or political point of view. The elements of magnificence and grandeur were all there; the old Roman conqueror celebrating his victories might have envied the peaceful English Queen the resources at her disposal; but these were sadly squandered. The white, yellow, and black men from the colonies were so massed together that the picturesque costume and bearing of each were lost in the hurried general impression formed as they passed. There was a lavish excess of dazzling uniforms and official robes; indeed, one felt, with perhaps a thrill of patriotism, that the severe civilian dress of the United States representative was a distinction in itself. But it is curious how ill at ease and ashamed the English officer appears to be when he shows himself to the public in his military capacity, while in the jumble of princes only the solemn beautiful Indians and the charming operatic Montenegrins could be distinguished. The one person in all that long array who seemed to understand what was expected of him—except, of course, the Queen, who managed to be as queenly as if bonnet and parasol had been exchanged for crown and sceptre—was the Lord-Mayor on his way to Temple Bar to receive her Majesty, and again as he returned, bearing his sword, to the Mansion House. He wore robes of velvet and ermine, he rode a fine horse, he held himself with dignity, and he beamed in such unaffected delight, he bowed so gayly, as the people greeted him with deafening shouts, that it was a pleasure to see him. If kingdom and empire fail in time of rejoicing, the City of London, at least, still knows how to conduct its ceremonies with proper dignity and display.

Again, with the illuminations there was the same waste, the same thriftlessness, the same reliance upon chance. Again there was the same individualism revealed in the scheme, or lack of scheme, adopted. Naturally, even this haphazard arrangement sometimes produced beauty. There is no finer river than the Thames as it flows through London, and when, in the blue night, the dome of St. Paul's rose white and shining above it; when, as a strong searchlight fell upon them, the buildings on its banks became so many palaces; when boats with red and blue and gold lights floated across its waters—why then it was more like a river in fairy land—the "River of Dreams" that Mr. Henley calls it. But this beauty, after all, was not designed; it happened, as beauty always does in London. And now that the Jubilee is over, one realizes that thousands and millions have been spent, and actually nothing remains to show for them. Not that one is so sordid as not to believe that nations and cities, like individuals, are all the better for letting themselves go now and then, for a little generous outburst of extravagance. But there is the regret that in this case the extravagance did not fulfil its object at the moment, and has left no triumphant trophy behind—not a building, not a statue, not an archway, not a monument to remind the generations to come of the way the sixtieth anniversary of the Victorian reign was kept. The Hospital Fund is supposed to be the noble monument erected. But there was a time when those who gave to the poor and the weak could house their charity becomingly, so that the artist now rejoices in the hospital, as he sees it from without, no less than the sick rejoices in the shelter and comfort it affords within. But in our utilitarian age there is no thought for art. Besides, the Jubilee policy seems to have been, save for this Hospital Fund, to enjoy to-day and let to-morrow look out for itself. Were not the thousands presented to the Princess of Wales to feed the poor, eaten up in an afternoon? Such a policy has its own splendor of recklessness; there is always a something of romance about the spendthrift. But why not, to borrow a phrase from Ibsen, be reckless beautifully?

N. N.

A PSYCHOLOGICAL MUSEUM.

FLORENCE, June 25, 1897.

Florence is so preëminently a city of historical and artistic interests that the average tourist does not suspect the wealth of its splendid scientific collections; hardly even their very existence. The immortal Baedeker, it is true, mentions several modern museums, but these are not granted the double stars which point to the sight-seer's true goal; and the only indication of the very curious rooms of which mention will presently be made, seems to be that of a "musée indien fondé par A. de Gubernatis" (Baedeker, 'Italie Septentrionale,' pp. 365 and 410, ed. 1895). This museum, which is reached from the Via Gino Capponi, and not through the main University entrance, in reality forms part of the Section of Anthropology in the Instituto dei Studii Superiori, and should be so described; for although the "Indian curiosities" include several interesting relics from one of the voyages of Cook (the navigator, not the tourist agent), the ethnological and anthropological purposes of the display are its chief grounds for existence. Further, the museum has long been superintended by Prof. Paolo Mantegazza and his distinguished assistant, Signor Ettore Regalia. Count Angelo de Gubernatis left Florence some years ago, in order to fill the chair of Italian Literature in the Sapienza at Rome.

There are in this museum two small rooms and a cabinet to which an unusual measure of interest attaches, both because of the original idea implied in their foundation and from the number of singular objects they contain. These constitute the "Psychological Museum," established by Prof. Mantegazza in 1889, under the sanction of a royal decree of that date. The present writer remembers reading, a few years ago, a somewhat inadequate notice of this collection in the Italian correspondence of the oldest of European reviews. The sex of the writer was unfortunately betrayed by the tone of a comment on one of the divisions. Prof. Mantegazza's intention is to illustrate, or symbolize, human passions, sentiments, and so forth, with the help of objects which serve in their expression or their gratification, or both. In view of this, human feelings have been divided into the Sentiments of Religion, Cruelty, Vanity, Caricature, Property, and *Sentimenti Diversi*, to each of which one or more cases in the museum have been allotted. The most obvious commentary on this arrangement would bear on its doubtful scientific accuracy and usefulness; but until we have, as Mill said, a "Science of Human Nature," all such classifications are bound to violate the rules of formal logical division, nor will the ordinary visitor give much thought to the general plan of a collection whose details are in themselves sufficiently odd and fascinating.

As the manuscript catalogue shows, the whole exhibition consists of some 1,487 numbers. By far the largest part of this collection consists of objects illustrative of the religious sentiment, with the subdivision of superstition in some of its commonest forms. As will readily be understood, we find here not only religious emblems, such as crosses, etc., but the various artificial aids to worship in ordinary or extraordinary use. Here, therefore, are rosaries, medals, scapularies, chaplets, taliths, phylacteries, etc.; while the influence of superstition may be held to be amply represented in charms, amulets, works on the interpretation of dreams or other omens, recipes for love-philters, the familiar coral branchlets still used in Italy

as a protection against the *jettatura* or evil-eye, and so on. One of the most curious things I discovered in this department was a special form of prayer for curing babies of worms. It would, however, be rather hard to explain the presence on the same shelves of a little paper ticket (No. 443), which is said to have been used by students in Berlin under circumstances rendered plain enough by the accompanying inscription: "Ich kneipe diese Nacht. Sollte ich meinen Weg nicht mehr finden, so befestigen Sie mir gefl. diesen Zettel im Knopfloch und *senden mich heim*. Name :.... Wohnung ....." Another puzzle was the catalogue-description of a large rosary made of wooden beads (No.1433) said to have been "usata dai *Protestanti* negli Stati Uniti d'America," the italicized word having been substituted for *Cattolici*, which is scored out in the manuscript list. I had not the courage to ask Signor Regalia any further details concerning the worship of the sect to which the use of this chaplet is ascribed. As an illustration of the unexpected way in which a familiar and venerable superstition may be applied to thoroughly modern conditions, one notices, close by, the badge or ticket of Bed No. xiii. in a hospital at Florence, which a woman refused to occupy.* Less easily accounted for is the belief among Ligurian sailors and fishermen that two plain unblessed bits of string (No. 293), when tied around the ankles, are a guard against cramps. In the present writer's school days, it was generally held among the boys, on equally warrantable grounds, that two crossed horsehairs in the palm of the hand would not only prevent pain altogether, but infallibly break the cane.

Symbolical expression of the gloomy element of intense religious belief is found in a case filled with hairshirts, scourges (*discipline*), and other ingenious devices against physical comfort, many of which still show bloodstains from old use. Here, for example, is a belt of iron wire bristling inwardly with sharp points, and admitting of tight or loose buckling to suit the severity of the penance. The buckle is cruciform and has little attachments in the shape of small serrated disks, which swing about under the penitent's gown and describe arcs of circles on the skin. One sometimes reads of mock flagellations inflicted with lashes of tow, but the scourges displayed here are undeniably serious. They consist of a dozen or more small metal plates, shaped somewhat like the patent tag on a key-ring, and arranged in the form of a triangle, to the apex of which the thong was fastened. It is a genuine relief to turn from all this to a neighboring shelf, on which stands an original toy—a small wooden church with altar and benches but without a cross, bearing on its façade the inscription, "Maria Mater Grazie." How far such a plaything would foster the growth of religious reverence in the mind of a child would be an interesting subject of experiment for students of what Max Müller contemptuously terms "Nursery Psychology." *A priori*, I should be disposed to place this in the same category as No. 1434, paper money devised by the late Arturo Issel, professor of geology, for the dissemination of useful knowledge, each denomination being a separate booklet setting forth the elementary principles of some science.

* If we are not misinformed, several of the leading hospitals of New York, in deference to this superstition, omit 13 in numbering their beds.—Ed. Nation.

After the remarkable collections of instruments of torture in Munich and Nuremberg, Prof. Mantegazza's rather meagre array of inventions illustrating cruelty attracts but little attention, save for two or three of its items; such, for instance, as a sword-belt of tanned human skin (No. 812), and a mummified forearm (No. 858) from New Caledonia used as a summons to a cannibal orgy. Among the prison-chains, also, one sees (No. 645) a set of gyves, said to have come from the hideous prison of the Bargello, where visitors are now shown Giotto's celebrated fresco-portrait of the youthful Dante, so long hidden under a coat of whitewash. Not less interesting is a set of woodcuts representing conventional modes of torture, and others not known even to readers of Fox's 'Book of Martyrs.' Side by side with these, I found the bound numbers of *La Lidia: Revista Taurina* (Madrid, 1888), and one or two cheap handkerchiefs from Seville with pictures relating to bull-fighting. It need hardly be added that poniards, stilettoes, and iron-knuckles find their proper place in this department.

Much the weakest part of the museum is that relating to Vanity, in two or three cases imperfectly filled. The specimens for the most part might be considered as a sly satire on women, for they include chiefly mechanical devices for aiding or correcting nature in the matter of beauty of figure, most of which, by the way, are now lamentably out of date—even in the eyes of a man. It was this department which stirred the susceptibilities of the correspondent above referred to. Masculine vanity, however, comes in for its share in an exhibit which the reader will be surprised to hear was bought for one hundred francs. This is the outfit and insignia of a grand master of the Masonic Order, of the genuineness of which there can be no manner of doubt. Freemasonry still plays so important a part in the political affairs of Italy that one might almost suspect a covert sarcasm here; but the seriousness of the collection puts this out of the question. Still, without any injustice to the teaching profession, it will readily be believed that No. 1487 (the last in the catalogue) gave the dignified curators of the museum a little thrill of malicious pleasure, as it did, indeed, the present writer. It consists of a thin pamphlet setting forth the testimonials received by Professor G. C. of Turin, on the twenty-fifth anniversary of his occupancy of a chair in the University—all these honors, from the crowned heads of Europe and the highest of academic dignitaries, having been decreed to himself (*decretati a se stesso*) by the alleged recipient. There can be no indiscretion in revealing to American readers the existence of a bogus manifesto which a short time ago increased considerably the labors of several hundred postmen on this continent.

According to the founder of this museum, the Love of Property admits of illustration by means of locks and keys, and also by "burglarious" contrivances for overcoming these obstacles. Although several of the specimens have artistic merit as examples of forged ironwork, it is a surprise to the visitor not to find among them a single product of contemporary locksmithing; nor, so far as one unlearned in these matters could judge, would the pick-locks and skeleton keys be likely to do dangerous service in our day.

As for Caricature, which appears as a separate division, in two large cases, the principal result on the visitor's mind is to confirm his belief that there is no accounting for the vagaries of the sense of humor in the human race. Even Callot's sardonic distortions of his fellows' countenances, and still more the clever series of drawings by Cham, entitled "Les Tortures de la Mode," fill one with wonder that such exaggerations could ever have raised a smile, and almost with regret that such artistic skill should have been wasted on subjects so hopelessly ephemeral in their interest as the fashions of a day. The impression is deepened by the collection of political satires and caricatures, chiefly relating to Italy. In our eyes there is neither very bitter satire nor profound humor in a coin of ten centesimi, bearing an effigy of Victor Emmanuel in full pontifical canonicals; and probably in a few centuries such a joke as this will appear quite as vapid as a comedy of Aristophanes now does to the uninitiated. Besides these, the department of Caricature contains a set of small terracotta busts, each of which represents a human type, of a disposition or a profession—the haughty man, the drunkard, the angry man, the waiter, and so on. This collection was rather dear at one hundred and fifty francs, for a more undeniably conventional set of faces it would be difficult to find; they remind one of the plates in Lavater's 'Physiognomy.'

"Sentimenti Diversi" is a most convenient expression for lumping together a large number of odd objects not readily classifiable; and the reader must not imagine that the title stands for "Mixed Motives." Had such a denomination as the latter been adopted, probably not a single specimen of the museum but would have admitted of classification under this head, thus producing in the catalogue a perfectly bewildering labyrinth of cross-references. But there is obviously some difficulty in deciding the exact place to be occupied by such an object as the following: A small casket containing relics of the "illustrious martyr," accompanied by a letter dated "Longwood, 18th June, 1861," and signed "Gauthier de Rougemont." Its contents are:

"1. Une petite bouteille d'eau puisée à la fontaine où allait se désaltérer le César des Césars, dans sa promenade à la vallée du Géranium, aujourd'hui vallée du Tombeau.

"2. Feuilles de saule du tombeau du plus grand des capitaines.

"3. Morceau de bois de la muraille contre laquelle s'est appuyée la tête de l'Empereur.

"4. Un second morceau pris au niveau de la tête de l'Empereur," etc., etc.

In default of immediate personal relics, such as hair, buttons, or shreds of clothing, the sentiment of hero-worship attaches value to strange things indeed; but one feels inclined to recommend to collectors of this stamp the careful perusal of Calverley's poem on the cherry-stones dropped by H. R. H. the present Prince of Wales, which some of his loyal subjects, one day to be, picked up as they fell from the august lips.

Passing by the beginnings of an Advertisement collection, from which Chéret and his imitators are rather conspicuously absent, one is attracted by a large case in the middle of the front room, which, in spite of the gruesome nature of its contents, no one can fail to examine with very particular attention, for, so far as the present writer knows, this is absolutely unique. It is an array of bits of human skin admirably mounted,

varying in area from two to three or four inches square, tattooed in a great variety of patterns, and representing the custom of dermal inscription both in savage and in civilized countries. The ticket, *Sentimento Religioso*, at the end of the case, does not refer to all of these; tattooing, as every one knows, being practised from a great variety of motives, among which vanity plays a prominent part. This collection is so complete, and the specimens with their inscriptions are so excellently preserved, that a separate paper would be required to do it appropriate justice.

Lastly, in a cabinet which is very judiciously closed to the public, there is found a small exhibition of objects representative of the human appetencies, normal and abnormal, which the French fiction of the last 150 years has exploited, for literary and business purposes, with so much regrettable pertinacity and still more regrettable success.

It would be quite foreign to the purpose of this sketch to offer long discussion on Prof. Mantegazza's scheme and its execution. The museum is admittedly a mere beginning, which in all likelihood is destined to be an end also. Who, indeed, would have the courage to undertake the complete exposition of human character and disposition with the help of purely objective, symbolical means? The world is all before him, where to choose. Doubtless, from time to time, presentations and gifts will add to the collection, but the practically minded men who direct the application of the finances of public instruction in Italy are much more inclined to notice what seems chimerical in the plan than to recognize the singular originality of the conception. Besides, for actual teaching purposes, the most perfect of "psychological museums" would be little better than useless. Here would certainly be the occasion for echoing Prof. Ladd's warning, "If you would be true psychologists, leave your books, laboratories, and museums, and study the daily life which your fellows lead alongside of you." The true psychological museum is the world itself, of which uniform classification remains impossible, since, as has been said, no two human beings ever dichotomize the universe at the same point.

In conclusion, the writer desires to offer his very sincere thanks to Signor Ettore Regalia, assistant curator of the museum for the generous way in which catalogue, keys, etc., were placed at his disposal. This is only one item in the large debt of gratitude owed by the writer to several of the eminent men composing the staff of the University of Florence. P. T. L.

Correspondence.

WILL AND SHALL.

To the Editor of The Nation:

Sir: All lovers of correct speech and writing will have read with pleasure the remarks of "A Super-Octogenarian" on the misuse of *will* and *shall*. This misuse is perpetually cropping up, sometimes in the most unexpected places. I could name more than one "monthly" of large circulation and good standing which misuses these little words about as often as they can, and, to judge by the correspondence in its educational journal, one of our largest cities has a number of high-school teachers who hold themselves *super grammaticam* with respect to *will* and *shall*, *would* and *should*—if they know it; while too many school-teachers everywhere seem to consider such sentences as "We *will* confidently expect you" correct in both speech and writing.

But I would venture to ask "A Super-Octogenarian" whether, when he wrote "Schoolmasters *had* made haste to make (the correction), . . . fearing their pupil *will* be told," it would not have been more grammatical to write "fearing" they "*would* be told"? It may also be observed that neither the mnemonic quatrain nor the Scotsman's mistakes furnish a complete guide to the proper use. The use in interrogative clauses, for example, requires special treatment.

Yours very respectfully, C. J. Gedge.

Berkeley, Cal.

Notes.

Memorials of William Cranch Bond, Director of the Harvard Observatory, 1840-59, and of his son and successor (1859-65) George Phillips Bond, drawn from the family papers, have been prepared in a single volume, well illustrated, by Prof. Edward S. Holden of Lick Observatory. It will be issued in a small edition by C. A. Murdock & Co., 532 Clay Street, San Francisco (New York: Lemcke & Buechner).

Henry Frowde, 91 Fifth Avenue, is about to publish for the Egypt Exploration Fund part of a papyrus book found some 120 miles south of Cairo on the edge of the Libyan Desert; a single leaf, consisting of *Logia*, or Sayings, of Jesus, detached and without context. The writing is uncial and very clear, and will be reproduced by the collotype process. A cheaper edition for wide circulation is contemplated. The collection may date from the second century.

The Clarendon Press is publishing a short account of the newly discovered portions of the Hebrew text of Ecclesiasticus (xxxix., 15—xlix., 11). Dr. Neubauer and Mr. Cowley, the editors of the recently issued facsimile, are the authors of these prefatory remarks, and of a prose translation from the Hebrew original which they introduce. This translation is printed with the revised version of 1895 on the opposite page. The two versions are placed so as to correspond line for line as far as possible. By this means certain omissions and blunders committed in the Greek translation and inevitably reproduced in the revised version, become apparent. In chapter xliv., v. 4, the second part of the second couplet was omitted in the Septuagint; a whole couplet is lacking in xlii., v. 11, so that verse 12 seems to introduce a new subject, and is hopelessly obscure. The most important further omissions appear in xxxix., vs. 20 and 21, in xli., v. 9, xiv., v. 25, and in xlvi., vs. 13 and 19.

T. Y. Crowell & Co. have seized the opportunity to present to English readers the remarkable Polish novel, 'Demoiselle Micia,' by Mrs. Margaret Poradowska, of which mention was lately made in these columns. Miss Hapgood will be the translator.

The Century Company will issue in the autumn Bishop Potter's 'The Scholar and the State,' Mary Hartwell Catherwood's 'The Days of Jeanne d'Arc,' and a child's book on the same heroine, illustrated in color by Boutet de Monvel.

The first fall publications announced by G. P. Putnam's Sons are 'Impressions of Turkey during Twelve Years' Wanderings,' by Prof. W. M. Ramsay; 'The Story of the Palatines,' by the Rev. Sanford H. Cobb; 'Some Colonial Homesteads and their Stories,' by Marion Harland; 'Chronicles of Tarrytown and Sleepy Hollow,' by Edgar Mayhew Bacon; and a 'Life of Ambroise Paré,' by Stephen Paget.

Henry Holt & Co. have just issued a book of some 280 pages that will be greeted with joy by those French instructors who use, or are intending to adopt, a scientific method of teaching French pronunciation. The work is called 'Chrestomathie Française,' and has been prepared by Professor Rambeau of Johns Hopkins and Jean Passy, a brother of the distinguished French phonetician. It consists of assorted texts, representing many styles and various degrees of difficulty, printed both in the standard spelling and in a phonetic transcription, and preceded by a brief introductory chapter on French sounds. The phonetic alphabet used is that of the *Maître Phonétique*. The composition of a work of this sort demands an enormous expenditure of time and careful labor; and as the sales will necessarily be (for a long time, at least) extremely small, the gratitude of all phoneticians is due to the disinterested efforts of the compilers.

We are reminded afresh by 'The Story of Butte,' an illustrated special edition, in pamphlet form, of the Butte *Bystander*, of the opportunity such crude histories afford foreign students of our growth and institutions of getting at the very pulse of the machine. Where the greatest mining city in the world now stands, there was not a habitation in 1864; and in 1875, as a panoramic photographic view of the period shows, the settlement numbered probably less than a hundred houses. Its population now numbers 45,000, and it has in thirty years produced $300,000,000 in precious metals. But most valuable in this history is the long line of portraits, with biographic sketches annexed, in which the American physiognomy and character as affected by the Western environment are so instructively exhibited. They typify the men who are now in the saddle, politically speaking, wielding through the Senate of the United States an utterly disproportionate power to shape the national policy and to fix the national tone. They are worth scrutinizing even to the very cut of their hair.

The ready-made reading-notice sent out with the July number of *Godey's Lady's Book* asserts that the magazine celebrates the beginning of its sixty-eighth year by the issue of an anniversary number, the title cover of which is a reproduction of the first cover ever used by the magazine. But the cover so reproduced in no way resembles the original, which was a plain piece of printer's work without aid from the engraver, the only words in large type being "The Lady's Book." "Godey's" did not form part of the title till several years later. The cover now given, with the interpolation of the original date (1830), was first used about 1855.

The new fortnightly review, *La Diplomatie* (Paris, 50 Boulevard Haussmann), appears to have taken its crease, and is to be described as a quarto, with a pictorial cover containing the portrait of some sovereign or other personage; and made up in-

ternally of an editorial review of the politico-diplomatic situation the world over, regular foreign correspondence in the same line, and an agreeable miscellany concerning "mundane life," Parisian life, the theatre, finance, trade, science, literature, in a certain irregular constancy. This lighter portion is often illustrated with portraits. The recording of diplomatic documents the review will perhaps leave entirely to the *Mémorial Diplomatique*.

The railway from Loando into the interior of the Portuguese colony of Angola is now running as far as Ambaca, a distance of 225 miles. The construction of the road, according to the *Revue Scientifique*, has been entirely by negroes, under the direction of European engineers, mostly French. At the same time, technical instruction was given to the negroes so successfully that "it may be said that they manage the line at present," as well as form the personnel of the telegraph service and are the artisans in the workshops.

The progress made on the Great Siberian Railway during the year 1896, according to the official report to the Czar quoted in the Consular Reports for June, consisted mainly in the construction of 878 miles of roadbed, making the whole length of rails already laid, excluding stations and sidetracks, 2,262 miles. The work of providing for steam transport across Lake Baikal was also begun, and will be finished in 1898, when the railway will probably be completed to Irkutsk. Up to the present time, $38,045,388 has been appropriated.

In the same publication is an interesting account of the successful prevention of hailstorms by means of explosions. An owner of extensive vineyards in Austria has erected six stations on six prominent heights about his land, and commanding a territory of about two miles in extent. These stations each contain ten mortars loaded with 4¼ ounces of powder. At the first indication of a storm a corps of volunteers, consisting of neighbors who are also owners of small vineyards, hasten to the stations and shoot the sixty mortars regularly and simultaneously until the clouds are scattered. In one of six instances last summer "the cloud wall opened up funnel-like, the mouth of the funnel began to rise in the form of consecutive rings, expanding gradually until all of the clouds scattered and entirely disappeared. There was no hail or even a sudden downpour of rain."

The annual report of the State Geologist of New Jersey for the year 1896 is a thick volume of varied contents and exceptional interest. Much of it (and not the least valuable part) is in continuation of past research. Such is the report of progress in the investigation of the surface geology of the State, conducted by Messrs. Salisbury and Knapp and now practically concluded; the fresh list of artesian wells by Lewis Woolman, accompanied by an account of recent significant discoveries of fossils in the Fish House black clays; Mr. Vermeule's notes on the great flood of February 6, 1896, in northern New Jersey. Quite new, and possessing a real economic and sanitary importance, is the last-named writer's engineering scheme for the drainage of the Hackensack and Newark tide-marshes—a problem of a kind in which New Jersey abounds, viz., How far is this a State matter, properly to be executed at the general expense? Or, if a local concern, how to unite in it the communities directly interested? There can be little doubt that the proposed redemption of the marshes would be a profitable undertaking apart from its indirect beneficial effects. Numerous maps and sections and other illustrations enrich this volume.

While our effete republic is first filling the new posts in the National Library politically and then "covering them into the civil service," the effete Italian monarchy is holding a competitive examination for assistant librarians in the Government public libraries, under article 122 of the statute regulating those institutions.

The valuable Necrology annually prepared for the Alumni Association of Andover Theological Seminary by its Secretary, the Rev. C. C. Carpenter, records the death of thirty former members of the institution, the smallest number for any year hitherto reported. Owing to three deaths at unusually early ages, the average duration of life is reduced to seventy years; but there were nine deaths at over eighty and seven between seventy and eighty. Perhaps the best known of those who passed away was Dr. A. H. Quint; but Prof. Blaisdell of Beloit College and the Rev. Luther Farnham, the Secretary of the General Theological Library in Boston, filled important positions. A list of the addresses of the present members of the Association accompanies the Necrology, and if the membership can be enlarged to an extent sufficient to justify the expense, a full list of the addresses of all living alumni will be prepared for publication next year. The annual fee of membership is one dollar, the payment of which entitles the member to receive the publications of the Seminary, including the next general catalogue, to be issued probably in 1900. Remittance may be made to the Treasurer, the Rev. W. L. Ropes, Andover, Mass.

Among the Jubilee honors given in England, some are not without interest to Americans. Mr. Maxwell Lyte, the deputy keeper of the records, has been made a Knight of the Bath. The Grand Cross of the same order has been conferred upon Sir Arthur Haliburton, the Under-Secretary for War, who is a son of "Sam Slick." Sir Arthur is a native of Nova Scotia.

—The *Century* for July contains some entertaining illustrated articles on Sport—"After Big Game in Africa and India," by H. W. Seton-Karr; "Hunting the Jaguar in Venezuela," by William Willard Howard; and "Sports in the Seventeenth Century," by W. A. Baillie-Grohman. The jaguar is not usually a very terrible beast, though Mr. Howard makes the most of him, and describes a curious way of destroying him, which sounds thoroughly Venezuelan. The hunter directs at him a long spear, at an angle of forty-five degrees, the butt of the shaft planted in the ground. The animal springs at the hunter, and impales himself on the spear, while his crafty enemy "dodges to one side and rolls over out of harm's way." The contrast of the popular European sports of the seventeenth century with those which Europeans to-day pursue in Asia and Africa, shows that we have opportunities of which our hunting ancestors hardly dreamed. John C. Van Dyke's "William Hogarth" is written to accompany three of Cole's new series of wood engravings after Old English Masters. There are a good many pictures by Joseph Pennell in this number, some illustrating a sketch by Mrs. Pennell, called "Play in London"; others, and better ones, an article on "The Churches of Poitiers and Caen," by Mrs. M. G. Van Rensselaer.

—Dr. Edward Waldo Emerson, in the *Atlantic*, publishes a correspondence between Sterling and Emerson, with a short sketch, which altogether reveals clearly not only these two idealists of a day now past, but, by way of vivid contrast, their friend Carlyle. The letters breathe an atmosphere of friendship and purity and at the same time of complete abstraction from the world. As we get further away from the period to which they belong, we grow more and more out of literary sympathy with the feelings and conceptions that underlie what is said. We clearly comprehend that Sterling thinks that "there are hardly, perhaps, three Englishmen living with the slightest thought of what art is," and cannot help thinking that he felt that he stretched a point in admitting that there might be more than two. Then we read what Dr. Emerson calls Carlyle's "dismal summary" of Sterling's life, and wonder whether Sterling himself knew what art was. Aspiration is the one quality which breathes through the letters—the aspiration of lonely, yet humane saintship, eager for sympathy; and, perhaps, in a world that goes generally on its belly, this ought to be enough. But there is much more in the letters than this. Sterling's two Englishmen seem to have been Tennyson and Carlyle, though the former, he fears, "will hardly wake out of tobacco smoke into any sufficient activity"; the latter he calls "a gigantic anti-poet." Alvan F. Sanborn has a paper on the "Future of Rural New England," in which he describes the dead New England town—the antithesis of the "live" New England town as described by him in the May number. He adverts to one new feature of New England life which must in the course of time have a considerable influence on its character, though its full importance he does not, perhaps, appreciate—we mean the permeation of New England by city life, which establishes itself side by side with the old New England and more or less swamps it. "City people" are making homes in many parts of it for half the year, and thus bringing in capital and taste; the Episcopal Church, coming from the cities, is building pretty churches, and alienating the parishioners from the old barn-like Congregational church with its horse-sheds; dairy farms are being established which supply the city; good roads are demanded by "summer residents," and are being supplied by the State, a distant corporation, having its capital in a city. Yet the old political town-meeting machinery is still managed by the local assemblages of half-educated farmers, who look askance at all these innovations.

—The most important articles in *Scribner's* are on John Cabot, by the Marquis of Dufferin, who is chairman of the Cabot celebration committee, and on William Morris, by Walter Crane. Both are illustrated, and the former is accompanied by curious maps and facsimiles. Besides these, "Cavendish" gives utterance to some wisdom on the subject of "Whist Fads," which will probably please equally well those who play a good game and those who play little and care less. "The Modern Business Building," by J. Lincoln Steffens (illustrated), is the

fifth of a series of papers on the "Conduct of Great Businesses," by various hands, all of which are more or less entertaining. Mr. Steffens touches on the extraordinary changing "sky-line" of New York, such as, thanks to the topography of Manhattan Island, in combination with tall buildings, exists nowhere else in the world. Another paper on "Undergraduate Life," this time at Yale, by Henry E. Howland, gives a good deal of amusing local information. Mr. C. D. Gibson's "London" continues to be illustrated by sketches from life.

—Capt. James Parker, U. S. A., contributes to *Harper's* for July an interesting article on West Point "as an element in the system of national defence." Assuming that the object of a military academy is not simply to furnish officers for our little regular army (it is also assumed that a large standing army is out of the question), but to furnish a reserve of highly educated officers in case of need, he says that we have no adequate reserve. In 1812 the maximum of cadets was fixed at 260, the population being then 7,500,000, or at one cadet for every 30,000 population. The population is now not far from 75,000,000, while the maximum number of cadets allowed is only 370. In time of war we should have only some 1,400 West Point officers to count upon, and as the size of armies has enormously increased in the last thirty years, we may be said to be worse equipped for war in this important respect than we were in 1860. Capt. Parker thinks that in case of any actual fighting we should require at least 16,000 officers (*i. e.*, to officer 400,000 troops) of which the Military Academy ought to supply half. To produce 8,000 available graduates, six times the present number of cadets should be under instruction. To accomplish this end, he would have two additional military academies, one in the West and one in the South, for he says "the facilities at West Point could not easily be enlarged to accommodate this number of cadets"; and he would have appointments based on competitive examinations, as in the civil service. All this seems, on paper, plain sailing, but the difficulty arises when the question is asked, How are we to dispose of the graduates? As the army is not to be increased, there will be something like three graduates for every commission. Now a commission is the prize which draws young men to West Point, yet the author sees no way out of his difficulty but the discharge of all the superfluous cadets as soon as they shall have completed a term of service, say six months, with their regiment. This inevitably suggests a doubt whether the diminished chance of getting anything more than an education out of the course would still be sufficiently attractive to draw young men. Capt. Parker makes several suggestions of detail, but evidently speculation will not solve the main question, which is, how far the success of West Point is dependent on what is now its main feature—the certainty that a young man who succeeds there will get a commission for life. Capt. Parker's arguments apply, *sub modo*, to the army itself, as well as to the academy. That is, if our reserve of officers should grow, so should our *cadre* of men. In actual war a trained professional nucleus in the ranks gives steadiness to raw soldiers, just as trained officers create the army. The whole question is interesting, but Capt. Parker's treatment of it is not for Jingoes.

—Students, teachers, and readers of history will alike be grateful to Prof. Albert Bushnell Hart for his 'American History Told by Contemporaries' (Macmillan), of which the first of four volumes has recently appeared. If we may judge from the present volume, the plan of the series contemplates a collection of extracts from representative contemporary writers, arranged at once chronologically and topically, and intended to illustrate the social, economic, and political life of the people rather than to narrate the events of their history. The first volume deals with the era of colonization, from 1492 to 1689, the illustrative selections being grouped under the heads of Norse, Spanish, English, French, and Dutch discoveries, the conditions of colonization (as regards its reasons, its regulation, and the character of the emigrants themselves), and, finally, the separate colonies in order, and the general characteristics of the Southern, Middle, and New England sections. The extracts, of which there are one hundred and fifty-seven, are short, few exceeding three or four pages in length. Each is prefaced by a few lines of introduction, with bibliographical references; there is also a useful general introduction on the sources and their use. Legal and constitutional documents are, as a rule, excluded, and the purely literary merit of the pieces chosen has been a secondary consideration. The volume has a good index, and a consolidated index to the series is promised. It is, of course, obvious that the preparation of a work of this character is primarily a matter of selection, for the available material is very great, and the judgment and skill of the editor will be shown as much by what he omits as by what he includes. Professor Hart has drawn his illustrative extracts from a wide range; we have most of the better known pieces, besides many familiar only to students, while the selection as a whole calls only for praise. Some more general comments suggested by the appearance of the work we reserve until the publication of the series shall have reached a more advanced stage; we do not hesitate, however, to commend the undertaking as likely to prove of indispensable usefulness in the study of American history.

—Writing from London, on the 2d inst., a correspondent says:

"The executive committee are busily engaged in making preparations for the coming conference of librarians, at which about 300 librarians from the United States are expected to be present. The meetings of the conference will take place in the famous Guildhall of London. Sir John Lubbock will be the President, and, in his absence, it is probable that Mr. Justin Winsor of Harvard will be moved into the chair. About thirty-seven papers have already been set down on the agenda. Twenty minutes will be allowed for a paper, and five minutes to a speaker taking part in a discussion. The conference will be opened at the Guildhall on Monday, the 12th, with a *conversazione*, and the reading of a paper by Dr. Garnett, C. B., the Keeper of Printed Books at the British Museum. The members will on the same evening be entertained by the Savage Club. On Tuesday they will be given a welcome by the Lord Mayor of London, at 10:30 A. M. From four to seven P. M. there will be a reception by the President and Court of Governors of that clerical institution known as Sion House, where are many old books relating to the English colonies in America. That same evening there will be a reception, by the Lord Mayor, at the Mansion House, from nine to eleven. On Wednesday, the 14th, the members will be entertained at a garden party, from four to seven, by the Marchioness of Bute. From ten to twelve o'clock that evening they will be given a reception in St. James's Square by Lady Lubbock. On Thursday, the 15th, there will be a visit to the library of Brook House, Park Lane, the town residence of Lord Tweedmouth, brother of the wife of the Governor-General of Canada. During the same hours there will be a visit to Apsley House, the residence of the Duke of Wellington, and there will be afternoon tea at Grosvenor House, with the Duke of Westminster, London's principal landlord, as host. At eight that evening there will be a special performance of 'The Merchant of Venice' at the Lyceum. On Friday, the 16th, there will be a visit to Lambeth Palace, the Archbishop of Canterbury's London house, where will be an exhibition of books and manuscripts. During the same hours Stafford House will be thrown open to members by the Duke of Sutherland, and London House by the Bishop of London. These are not all the junketings that are contemplated. Moreover, the department of science and art of the British Museum and the Public Record Office are to be made specially accessible to the participators in the conference, and they are to be made free of the Zoölogical Gardens from Sunday, the 16th, to the Saturday following. Of London clubs, the City Liberal, the Junior Athenæum, the National Liberal, and the Savage will open their doors to the male members, and the gentler sex will be welcomed by the Alexandra."

MASPERO'S STRUGGLE OF THE NATIONS.

The Struggle of the Nations: Egypt, Syria, and Assyria, by G. Maspero, Hon. D. C. L. and Fellow of Queen's College, Oxford, Member of the Institute, and Professor at the College of France. Edited by A. H. Sayce, Professor of Assyriology, Oxford. Translated by M. L. McClure. D. Appleton & Co. 1897. Pp. xii, 794. $7.50.

This book continues 'The Dawn of Civilization,' by the same author. It begins with the period of early contact and conflict between Babylonia and the western edge of Asia, and between Asia and Northern Africa. The date cannot be precisely fixed. When all the witnesses shall have been heard, it seems probable that a much earlier time will be accepted for these first contacts (at least those between Babylonia and the west) than Maspero contemplates in this volume. Professor Sayce, in his preface, refers with reason to the increasing antiquity of our sources, and the increasing clearness with which authenticity and trustworthiness may be ascribed to them. Dates of 5000 B. C. for early Babylonian civilization, and of 4000 for regular intercourse with Syria, in war and peace, now seem moderate. It is not a ground of criticism that Professor Maspero's statements already need modification here. It is only an evidence of the restless and rapid course of enlarging knowledge in our time. The author's endeavor has been to make use of the latest discussions. To a remarkable degree he has done so. All the recognized authorities in Assyriology and Egyptology are represented in his abundant notes; the references are given with care, and various opinions fairly stated. Even Mr. Petrie's discovery of "Israilû" on an Egyptian stele of Minephtah's time finds a place (pp. 436-443).

Maspero has some unusual qualifications for such work as he has undertaken. He has large knowledge as an Egyptologist, familiarity with the literature bearing on the rest of his field, the historical instinct, the power of combination, the gift of

pictorial narrative. The result is a work of comprehensive scope and sound basis, truthful, in the main accurate, and in a high degree attractive. Its abundant maps and illustrations—four hundred and more—increase its fitness for the intelligent public for whom it is designed. Some of them have exceptional value, even for those already well informed. Notwithstanding the abundant footnotes and citations of authorities, the aim of the work is essentially popular. The author does not usually debate points about which scholars are disagreed. He gives different views, and often selects one, but does not argue it out. His work is not of the same kind with that of Wiedemann, Tiele, and Müller; Eduard Meyer's 'Geschichte des Alterthums,' which covers much the same ground, is more suggestive and stimulating for students, and a better guide to investigation, although a book a dozen years old is in this field no longer modern. Maspero attracts by the breadth of his canvas and the interest of his subjects, by the artistic grouping of his materials, the lucidity of his style, and the aptness and profuseness of his illustrations. His, then, is a book for a gentleman's library more than for a specialist's table or shelf.

It is noticeable that Egypt occupies the largest amount of space. This is due partly to the fact that the period covered in the volume includes the golden age of Egypt, the time of its greatest glory, political, architectural, literary. It is due partly to the resulting abundance and variety of material at hand, inscriptions, public and private, secular and religious, drawings and carvings of many kinds, objects of use and of ornament, permitting a fulness of description of military operations, household life, and common social phenomena such as we have as yet from no other ancient people. The unwrapping of the royal mummies, of itself, gives an opportunity for individual portraiture and characterization which no writer is at liberty to neglect. If an additional reason for the prominence given to Egypt be found in the special familiarity and independent competence of the author with reference to this department of his subject, it is only natural that it should be so. No doubt he has conscientiously endeavored to be impartial, and do full justice to each branch of his subject. The wonder is not that he occasionally fails, but that he so largely succeeds. It is in no fault-finding spirit that we express the wish that he might, *e. g.*, have dwelt a little more upon the early Babylonian culture, even if he could not portray it with the lingering affection which he devotes to that of Egypt in the long chapter entitled "The Close of the Theban Empire."

The pages occupied with Phœnicia and Syria (in the broad sense) are sufficiently full for the purpose. The author assumes a modest attitude toward the "Hittite" question. He seems rather less at home in Hebrew history than elsewhere. His work here contains frequent quotations and paraphrases from the Old Testament, and, for the rest, follows to a large extent Renan's 'Histoire du Peuple d'Israël,' although mildly, and without the ostentation of patronage which marks the attitude of that charming writer toward the Scripture narratives. He carries the Hebrew history down to the death of Ahab. The building of the nation, with its preliminaries, and the first two hundred years of the monarchy are covered, in a painstaking way. But the treatment is rather meagre and sometimes external. For example, we ought to hear more of the conflict between the unifying influence of the Yahweh religion and the centrifugal force of tribal and local prejudices. Besides things of this kind, in the author's desire not to bring in critical discussions which are still *sub lite*, he (or the translator for him, see below) leaves it sometimes obscure how far the paraphrases and quotations he makes from the Old Testament represent his view of the real history, and, on the other hand, while no one would ask for an equal space in such a work as this for the Hebrews as for the Egyptians, it would seem that some of the critical positions taken demand, for consistency, more statement of reasons or reference to authorities than we actually find.

One single danger Maspero has escaped. His general critical attitude is well known, but Prof. Sayce's name on the title-page occasions the fear lest that scholar's opinion as to the opposition between archæological science and the literary criticism of the Old Testament might have found a representative in France also, in Maspero's person. Happily there is no indication that this is the case. He does not even allude to the possibility of the acquirement of literary culture by the Israelites on their march from Sinai (!), nor in any other way do his own views lend aid to the reactionaries.

A few details may be noticed. One is surprised to read that the submerging of the cities of the plain "doubled the size of the" Dead Sea (p. 63). Maspero can hardly be thought wise in following Renan with the identification of the Haran of Gen. xi. 31, 32 and "the Syrian town Haurân": on the other hand, he shows a discreet caution in saying (p. 325) that a "monotheistic conception" of the religious innovations of Amenôthes IV. "does not seem to me [him] to be fully justified, at least at present, by anything in the materials we possess." The "Israîlû" of Mînephtah (p. 443) is presented with its variety of possible interpretations, but the impression left is one of uncertainty, and indeed the whole section dealing with the Exodus is vague. On pp. 479, 480 it takes a second reading of the account of the punishment denoted by the phrase "they died of themselves" to perceive the relation between the opinions expressed in the note and that of the author in the text. Pages 573 ff. contain a brief account of views as to the origin of the Phœnician alphabet. No decision is announced, but the only table given is that of the hieratic signs with alleged Phœnician and Greek equivalents. We miss on p. 787 some allusion to the connection between Ahab's treaty with Benhadad and the impending Assyrian invasion, but perhaps this will be considered in a later volume. This seems to be promised (p. 786), and may be expected to carry on the history from the ninth century B. C., of which the present volume touches only the earlier part. The sequel is sure in advance of a hearty welcome.

The translator's work is for the most part done so as to make the book very readable, and seldom to suggest the foreign idiom. "Traitorously" (p. 687) should rather be "treacherously." The attempt of the translator to stem the tide of criticism as to the mode of Sisera's death is rather plaintive and ineffectual. The reference to "C. Trumbull" and the PEF Quarterly Statement (p. 447) instead of to Dr. Henry Clay Trumbull's elaborate volume on Kadesh-Barnea is apparently from the original.

An article in the *Athenæum* for January 2, 1897, under the signature "Verax," charged upon the translator various omissions and alterations in parts referring to the Bible, made apparently in the interest of traditional as opposed to critical opinions. The existence of these omissions and alterations is unquestioned; they have been justified (in the *Athenæum* and in the London *Daily News*) by the Secretary of the Society for Promoting Christian Knowledge, under whose auspices the volume appears, on two grounds: first, that "it was our desire merely to soften certain expressions out of regard for the susceptibilities of English readers"; and secondly, that Prof. Maspero gave permission to make the changes. If Prof. Maspero accepts the changes as representing his views, the translator must be absolved of the charge of *mis*representing him. But there is still a responsibility to the English-reading public, and a curious question as to the reason for certain discriminations. Enough criticism is left to make sad havoc with the views currently understood to be represented by the S. P. C. K., and one wonders whether these slender modifications mark the limit of Prof. Maspero's good-nature. On the other hand, the effect of the changes is to weaken the statement of critical positions and to introduce a mistiness of view. That this has been done in the translation ought certainly to have been stated, at least in the preface. But what a commentary it is upon the confidence of good people in the truth of history that a great publishing society thinks it necessary to coddle and protect its grown-up readers by devices like this!

THE WIFE OF WASHINGTON.

Martha Washington. By Anne Hollingsworth Wharton. With portrait and facsimile. Charles Scribner's Sons. 1897.

Out of a few letters, most of which have been "edited" beyond recognition, a few relics, and many legends, the life of Martha Washington must be written. From material so slight as to give only occasional glimpses of the wife and almost no indication of the real woman, her character and equipment for the positions she was called upon to fill must be inferred, and without regard to the husband from whose light she derived her lustre. A mere clothing with all graces and fine qualities will result in presenting a puppet or overdressed doll; an intimation that she was a commonplace housekeeper will be resented as unpatriotic as it is unjust. Somewhere between these extremes the truth lies, and this latest attempt to draw an accurate picture of Martha Washington may be praised for its serious tone and its appreciation of feminine qualities. One essential is wanting, for it is the "Lady Washington" of tradition rather than the mistress of Mount Vernon and the wife of the first President that is delineated.

Nor is it strange that the attempt should fall short of success, for a good biography needs something more than mere research and a record of dinners and levees. Martha Dandridge was not different from other Virginia women of the last century. The social system of the colony was not calculated to

produce great as well as good women, and it is ridiculous to reason that because Washington was a great man, his wife must have been an extraordinary woman. Of the many great men that Virginia produced in the last century—the product, it must be remembered, of conditions peculiar to the colony—nearly all possessed as good wives as Washington, and yet it does not follow that there is abundant material for a new "Female Plutarch." The woman was the helpmeet, and doubtless bore her share in the anxieties and perils of the day; but her part is not to be described in the formal periods of history, however lovable may have been her qualities or noble her sacrifices.

In this respect Martha Dandridge stands in no prominence among her companions. Of a family which did little to distinguish itself, and which did not rank among the leading families of the colony, her early life was spent in the surroundings of a slave plantation. That fine women could come from that atmosphere, we know; but little attention was paid to education beyond the household arts of sewing and managing the shiftless and wasteful service of negroes, with dancing and a little music as accomplishments. A round of visits among the neighboring planters, an occasional visit to Williamsburg, with a presentation at the court of the often not very savory representative of the King, completed the necessary education of a girl, and she was then ready to receive offers of marriage. The glamour thrown by romance around the life on a tobacco plantation is dispelled by an examination of the farm accounts which reveal the pressure of the almost inevitable debts of the planter. Martha Dandridge was fortunate, for she early married a plain planter of New Kent, who inherited property, and, on his death, left her so well provided for that she was known as the "richest widow" in the colony. Of four children by this marriage, two died in infancy, and the two who lived became the wards of Washington when, after two years of widowhood, Mrs. Custis married the young Virginia officer.

Obscure as had been her life before this event, it became eventful only through Washington's career. The loss of her daughter and marriage of her son were the only notable events before the Revolution. From that time, mention of her doings becomes more frequent, and some little evidence is given of the impression made upon those who met or knew her. Her simple manners, plain style of living, her industry and perfect sincerity, and her compassion for the trials of the soldiers in the time of war are the prominent characteristics most dwelt upon. Later, and on the return of peace, as mistress at Mount Vernon, or as wife of the first President of the United States, she lived more in public view, but no additional characteristics are developed. Her home duties were many and exacting, and there is no question of her having performed them completely and without complaint. As the "lady of the President" she was somewhat isolated socially, and a natural reserve added to the dignity which appertained to the station. But it is not true that "the Washingtons quietly and unostentatiously mapped out their social duties according to their own ideas of propriety." That matter was made the subject of solemn questions submitted to the Cabinet and the Vice-President, and was determined by equally solemn answers and opinions; and the result tended to excite that scurrilous journalism of the day which believed that the charge of being "monarchical" was fatal, and yet in attacking the President on that charge, spared the wife—an example which the scribblers of modern sensations might do well to imitate.

The restraint imposed upon her by these rules of etiquette, and the heavy demands made upon her time by the almost ceaseless round of visitors, proved irksome to Martha Washington, and it was with relief that she returned to Mount Vernon, where the care of the house and of her grandchildren was so congenial to her tastes. In her whole life there was no event worth relating; and in her character it is only the sterling qualities possessed by every good woman that call for notice. As an example, it is well to direct attention to her as a type; but it is hopeless to invest her career with an interest peculiar to herself, or to distinguish her from the many whose fame as beauties or wits depends upon family tradition. As a result, it is still Washington who is the prominent figure in the book, and the uncertain tales of tottering memories serve only to pad out a story of the wife's uneventful career.

The most valuable part of the book is a very small number of Mrs. Washington's letters. That she wrote with difficulty is so well established that hardly a production of her own exists. It was her husband who drafted the letters for her use, and the formal sentences are very remote from her curt and easy phrases. What are properly attributed to Mrs. Washington prove her to have been devoid of humor or imagination, and are the straightforward and unadorned notes of one to whom composition was painful. Not a few of those printed in this volume have been so recast into modern form as to be unrecognizable as her own utterances, while others are clearly not of her writing. Some of the records of contemporaries are interesting, but the recollections of aged servants and of those who belonged to the succeeding generations are as uninteresting as they are unreliable. One such recollection is so little known that it will bear repeating, if only to serve as an example of what is gravely handed down as fact. Mrs. Boudinot, on being asked what she remembered of "Lady Washington," replied: "Oh, a child's recollections, my dear. I remember saying to my mother that I thought Lady W. a very dirty woman. She asked me why, and I said, 'Because she spits on the carpet, and her servant wipes it up with his pocket-handkerchief,' and she explained to me that it was not a handkerchief, but a napkin that he carried for that purpose." When the story of Mary Washington being in the habit of smoking a pipe is put with this, we begin to doubt the wisdom of written biographies that contain so large a proportion of oral tradition as does the work under review.

It is because the author of this biography has treated of historical records in other works that we are inclined to be severe on the many errors to be found in the present volume. The greatest freedom is taken with names, and the errors are such as could have been easily avoided. It is too late in the day to excuse Thompson as the spelling of the well-known Secretary of the Continental Congress. Lady Temple was not the wife of the "British Minister," for no minister of that name was appointed. The name of Mr. Daniel Huntington is twice misspelled. "Bouchier" is an incorrect spelling; G. W. P. Custis was not the "adopted son" of the General, but is three times described in the will as "my ward." "Fontleroy" is not the spelling given by Washington to his early flame; and the assertion that certain remarkable letters were addressed by Washington to Miss Mary Cary is against all evidence. It was Col. Wood, not "Ward," who represented Washington in his early election contest; the Bryan Fairfax place was Towlston, not "Towelston"; Magowan, Miralles, and Patey are the proper spellings for "Magowen," "Mirailles," and "Patcy." The author has discovered a number of officers, "favorites" of Washington, who have hitherto escaped the record of history—as, for example, Jacob Ford and Benjamin Grymes. It was Hodijah Baylies, not "Henry," who was an aid of Washington. The borrowing of "£10,000 for Washington's expenses before setting out for the capital" is magnified just one hundred times.

Bird-Life: A Guide to the Study of Our Common Birds. By Frank M. Chapman. D. Appleton & Co. 1897. Small 8vo, pp. xii, 269, pll. 75, figs. 25.

Wild Norway. With Chapters on Spitsbergen, Denmark, etc. By Abel Chapman. Edward Arnold. 1897. Large 8vo, pp. xiv, 350, with 63 illustrations.

Mr. Chapman's recent 'Handbook,' which we found we could hardly praise too highly, is speedily followed by another volume of similar purpose, addressed to more juvenile readers. It is a good book—any book which this author should write about birds would be a good one—but it is less maturely considered than his former treatise, and must stand in the shadow of a standard of excellence which the author can accuse only himself of having already set up. Neither work will be likely to help the other much; they are too much alike not to interfere with each other, and the exceptional difficulty of writing acceptably for children may not prove to have been wholly overcome in this instance. How it has been met may be said in the author's own pleasant words (p. vi):

"The following pages are not addressed to past masters in ornithology, but to those who desire a general knowledge of bird-life and some acquaintance with our commoner birds. The opening chapters of this book briefly define the bird, its place in Nature, and its relation to man, and outline the leading facts in its life-history. The concluding chapters present the portraits, names, and addresses of upward of one hundred familiar birds of Eastern North America, with such information concerning their comings and goings as will lead, I trust, to their being found at home."

This plan is admirably conceived and well carried out; there is a particularly pleasing daintiness in its execution. The author has also been fortunate in his artist, Mr. Ernest Seton Thompson, who can draw birds with a technique superior to that of Mr. Fuertes in most respects, though lacking in a certain touch the latter can give his compositions. The work may be commended without reserve to those who, not finding their needs fully met by the same author's 'Handbook,' may desire something superior to the numerous ebullitions of diluted popular ornithology we have had recent occasion to criticise.

Mr. Abel Chapman's three previous volumes of adventures in wild lands have made his name familiar as that of one of the keenest of sportsmen, who writes vividly of his experiences. The present work represents the mature results of sixteen years' exploits in the wilds of northern Europe, during which the Anglo-Norseman has made the most of his opportunities, and become a veteran whose story is well worth attention. "As regards salmon-fishing," he says, with rare modesty, "I write as an amateur, and the chapters thereupon should be read as the impressions of an enthusiast, rather than of an expert. In big-game hunting, having graduated in the craft since boyhood, I write with more confidence"; and, we may add, he can be followed with entire confidence in the verisimilitude of his narrative, regarded as a contribution either to adventure or to natural history. Reindeer and elk are of course the game which towers above all others in Norway; and the way in which these great creatures are brought before us, both with pen and pencil, is equalled only by the manner in which they were brought to book with the author's unerring rifle. The illustrations given of these animals are stronger and more life-like than any we remember to have seen before; the author says truly that "ten years ago nothing that was artistic was correct, and *vice versa*"; but Mr. Whymper has changed all that with remarkable fidelity to nature.

The necessary hardships of 'Wild Norway' can hardly be appreciated by one unfamiliar with the leading physical facts of that "land of fjeld and fjord." Half of it lies at an elevation of 2,000 feet or more; two-thirds of it is unproductive, and only an insignificant three per cent. of the whole country has been subdued by the agriculturist. To hunt there at all demands sacrifices which the author styles "infinite," and should be undertaken, or could be successfully prosecuted, only by the hardiest sort of men, who are careless of hardships, rough living, "and disappointments without end." Reindeer shooting is difficult enough to try any one's nerve and endurance, but there is hardly any large game in the world so difficult to overhaul and secure as the elk. Perhaps this is one of the reasons why, as we note with satisfaction, every part of these animals is utilized when one has been killed —in striking contrast to the wanton killing and woful waste which have always been the rule in our country, where elk and moose have been decimated, and buffalo practically exterminated. Statistics show for Norway for the years 1889-93 a yearly average of only 1,122 elks and 591 reindeer killed, not in the least endangering the perpetuity of either of these animals.

There is a curious little beast in Norway which does not loom up on the horizon like the giant elk, but has his points nevertheless. This is the lemming, whose portrait we must transcribe (p. 280):

"If his powers were proportioned to his pluck, the lemming would make things lively for the hunter. Had the bear, the lynx, or the mighty elk but a thousandth part of the lemming's aggressive ferocity, the relative positions of hunter and hunted would be reversed, and an expedition to the fjeld would require an advance guard of cavalry and a support of Maxim guns. The lemming attacks with reckless fury the harmless passer-by. One small creature (smaller than a rat) will assail, without second thought, a couple of human beings weighing 150 pounds apiece; it will spring to one's knees, biting and barking, and in purblind fury fall back all-ends-up to earth, only to renew the attack again and again."

This is the engaging creature so long famous for the irrepressibility of its migrations on so vast a scale that it was formerly fabled to fall from the clouds: witness the grave 'Historia animalis quod in Norvagia e nubibus decidit' of Olaus Wormius, 1653.

Mr. Chapman's book contains among other good things a great deal of ornithology, from the standpoint of the field naturalist. It would take us too far to specify his experiences with birds, game or other; but we must advert without animadversion to some remarkable statements he makes concerning migration. His position is substantially that of the late Herr Gätke regarding altitudes, velocities, and distances attained by many feeble-winged migrants. Here we must quote once more (p. 337):

"I am convinced that many birds of migratory habits are absolutely incapable, under normal conditions, of flying 300 miles, or anything like it. Among such I would include all short-winged warblers, chats, and goldcrests, quail, landrail, etc. . . . Yet, on the other hand, we have confronting us the solid fact that twice in every year these tiny creatures do traverse Europe from end to end."

He supports his contention with some remarkable facts concerning insect migrations over seas, and comes to the conclusion that some of the factors governing migration "have been overlooked, or yet remain to be discovered." This is scientific heresy; and orthodox believers will continue to hold the bird-seer of Heligoland for a Roman augur.

'Wild Norway' is certainly brought to us in a way which will make us glad to stay at home and read what Mr. Chapman has to say about it. The volume is well written, handsome in all its appointments, and well worthy of its place in the long series of fine books on similar subjects which the same publisher has issued.

Oberlin Thursday Lectures, Addresses, and Essays. By James Monroe. Oberlin, O.: Edward J. Goodrich. 1897.

From these unpretentious discourses and articles one learns incidentally not a little concerning the author's personal history. He was a native of Connecticut, and was still in his father's farmhouse, a boy of eight, when Benjamin Lundy, in May or June, 1828, halted at the door in his pedestrian anti-slavery propaganda which was to bear its richest fruit in Boston. It bore good fruit even in the boy's case, for he was delivering anti-slavery addresses at twenty, and continued in that line till he sought education at Oberlin in 1844. In 1855 he was elected to the Ohio House of Representatives; in 1860 we find him a member of the State Senate. In 1862 President Lincoln appointed him Consul at the port of Rio de Janeiro, and he remained at that post till 1869. From 1871 to 1881, a stirring period, he was a Representative in Congress. He is now one of the professors of his alma mater.

We pick these items out of the truly impersonal reminiscences because the mere enumeration of them shows that Prof. Monroe's experience has many historical relations; and we will say at once that his book is of the sort which usefully supplement formal histories. For example, if one wished to gain an idea of the repressive influence commonly and professionally exerted by the Northern clergy upon the nascent anti-slavery movement, he could not do better than read of the way in which the "venerable Dr. Dow," in his own Congregational pulpit in Thompson, Conn., snubbed our youthful lecturer in 1841. It was as if, said the Doctor, the zealous stripling had awakened him at midnight crying "Fire!"

" 'Young man,' I ask, 'is the fire on this street?' 'No; fire! fire!' 'Is the fire anywhere on Thompson Hill?' 'No; fire! fire!' 'Well, is the fire in the State of Connecticut?' 'No; fire! fire!' Growing impatient, I exclaim, 'Well, young man, where *is* the fire?' At last the answer comes, 'Why, Dr. Dow, the fire is in Lou-is-i-a-ny!' As the Doctor concluded, the old church rang with peals of laughter."

We do not know whether there is a soldiers' monument in Thompson (one such hopelessly disfigures the neighboring village of Brooklyn), but if there is, it shows that the Louisiana fire reached Thompson Hill under circumstances not conducive to hilarity.

The "Thursday Lectures" open with portraits and estimates of the early abolitionists, the successors of Lundy; and these chapters, if not above criticism as a judgment of the lecturer's first associates, are to be praised for candor, and are especially valuable as a record of what is most elusive —the personal quality of public speaking. So far as the abolitionist speakers are concerned, we have no exception to take. Here is a very discriminating word concerning "the prince of all anti-slavery orators—I had almost said, the prince of all the orators I have ever known":

"Mr. Phillips was never described by the reporters and reviewers as being a logical speaker. I do not remember to have seen the familiar epithet 'argumentative' applied to his efforts, and do not suppose they suggested it. He was impatient of the slow, syllogistic processes. Such terms as 'major premise,' 'minor premise,' 'à priori,' 'à posteriori'—I might almost add 'therefore' and 'consequently'—he never used."

In fact, acting upon this hint, we have discovered but one *then* and one *therefore* in Mr. Phillips's unusually argumentative speech on the "Philosophy of the Abolition Movement." But it probably pertained to his rhetoric that he did not knit his logic with the common signs of nexus.

In a later chapter Prof. Monroe performs a similar service for the leading speakers in Congress in his time, giving first place to Blaine as the orator for immediate effect; ranking Garfield, who was no debater, high among the teachers, in which class he rightly places Sumner, who, too, "was not a debater, nor was he, in the sense used here, an orator," but a marvellous rhetorician.

For clear exposition, the chapter on the Hayes-Tilden Electoral Commission is to be commended; and that on Seward's conduct of foreign affairs does not exceed a fair measure of eulogy, though it overlooks the politician's frailties. We are glad to find our author perfectly alive to the hollow pretence of a continuity of principle between the Liberty party and the Free Soil and Republican parties. He was not himself ready to vote the Free Soil ticket in 1848, but he found the path to political satisfaction and optimism when he subsequently concluded to vote even with a half-loaf party, rather than eschew party instrumentalities altogether. His new resolution was severely tested when he went up to the first Republican General Assembly in Ohio in 1856. His

abolition and Liberty party blood made him introduce an amendment to the State Constitution striking out the word "white" from the suffrage qualification. But Ohio Republicanism was by no means on that level, any more than Ohio lynch law is to-day.

"There were perhaps twenty-five Republicans in the House who would have voted with me in favor of this amendment, and it had been my intention to demand the yeas and nays upon its passage, and put everybody upon record. As the time approached, however, to do this, earnest representations were made to me by Republican members that it would do no good to call up the amendment for a final vote; that I knew as well as they did that it could not pass; that to insist upon a vote now would divide the party and produce bitter feeling; that it would commit against the amendment some candid men who were rather friendly to it, but had not yet fully made up their minds; that it would injure the prospects of some young members whose districts were so divided in opinion that for them to vote either way would be political ruin; that to push the issue further would drive the conservatives from our party, and give the next election to the Democrats; in fine, that public opinion was not ripe for negro suffrage, and that I must have the grace to wait. These arguments did not sound very satisfactory. They were not altogether to my taste at the time. But they are very familiar to a man who has acted with any party numerous enough to control legislative bodies."

Thanks to Shermans and McKinleys, they have remained familiar to Ohioans particularly; and, contrasting these trimmers and time-servers, plus the Grosvenors, Forakers, and Hannas, with Chase and Giddings and Wade, with Hayes and Cox and Garfield, one might well look in Prof. Monroe's pages for some sense of a cloud upon his "cheerful yesterdays." But we discern none, nor any evidence of self-restraint in forbearing to compare our present state with that earlier when, as the Italians say, times were better albeit worse—*Si stava meglio quando si stava peggio.*

The First Crossing of Spitsbergen. By Sir William Martin Conway. With contributions by J. W. Gregory, D.Sc., A. Trevor-Battye, and E. J. Garwood. Charles Scribner's Sons. 1897. 8vo, pp. xii, 371, with maps and illustrations.

Spitsbergen was discovered by Barendszoon and Heemskerk in 1576, revisited and further explored by Hendrik Hudson in 1607, after which it soon became the seat of important fisheries of the whale and walrus. While these lasted, Spitsbergen was a busy and populous place during the summer months. Dwellings, storehouses, and try-works for boiling blubber were set up, and Smeerenburg, the principal place of resort, is said to have had a summer population of 18,000 people. By the middle of the seventeenth century the whales had been driven out of the waters adjacent to the island, the fisheries declined, and a few years later Smeerenburg was abandoned to ruin. About the middle of the eighteenth century Russian trappers from the Archangel district made the archipelago the scene of their activity, wintering in scattered huts, and, until the supply of bears and foxes, which formed the staple of their catch, was exhausted, they did very well. About 1830 the last of the Russians disappeared to return no more. They in their turn were succeeded by Norwegians, who now alone make these islands and waters the home of any industry. Sloops and cutters from Hammerfest and Tromsö still visit Spitsbergen in small numbers to secure mixed cargoes of anything which comes to hand, such as eider-down, seals, white whales, shark's livers, and occasional bear or walrus, but chiefly reindeer, the meat of which fetches a good price in Norway. Thus hunters of all the Northern nations have at one time or another sought Spitsbergen for industrial purposes, and, by their ruthless methods of extermination, have left it almost destitute of important animal life. At present it is a No-man's Land, annexed to no state and governed by no laws, without permanent inhabitants. There is no close time for bird or beast, the fisheries are unregulated, and the extermination of its fauna threatens to become complete.

The scientific exploration of Spitsbergen has been the work of the present century. Keilhau, a Norwegian, began the study of its geology in 1827, but the real originator of its systematic scientific exploration was the late Prof. Sven Lovén, who visited it in 1837. He was followed by Torell and Nordenskjöld in 1858, since which time Sweden has sent no less than nine scientific expeditions to the archipelago, while from England and Germany have come Lamont, Leigh Smith, and Von Heuglin. Most of the work was coastwise and but little exploration of the interior was attempted. Up to 1896 the interior of Spitsbergen was practically unknown; the island had never been crossed, and, from the best information he could gain, Conway was led to believe that, after passing a few miles of peripheral bogs, a general smooth area of snow would be found covering the main portion of the interior. The northern and southern portions of the island were supposed to be wholly buried under huge ice-sheets, and in the central portion, where many valleys were recorded as penetrating the hills, it was thought that easy access might be had to the hypothetical snow-covered plateau continuous to the eastern coast. Under this impression Conway provided himself with sledges and ponies to draw them—a combination which proved eminently unsatisfactory. The main object of the journey was to cross the island and reveal the character of its interior. The method originally proposed was that of striking across the island on two or three lines. After a few days' experience this was found impracticable. The intricate nature of the topography involved detailed study of a specific area, and this was successfully carried out.

The plans were approved, and the expedition subsidized by the Royal Geographical Society. A grant from the Royal Society enabled a geologist, Dr. J. W. Gregory of the British Museum, to be added to the party. Other members of the party were Mr. A. Trevor-Battye, known from his exploration of the Kolguieff Island and as an ornithologist; Mr. E. J. Garwood, an expert mountaineer; and Mr. H. E. Conway, artist, whose industry is abundantly in evidence in the numerous illustrations of this volume. It happened that the Vesteraalen Steamship Co. of Norway undertook to establish a tourist service to Spitsbergen, including the erection of a small inn at Advent Bay. The author was able to engage transportation for the party, together with two Norwegian ponies, on the steamer which carried material for construction. They reached Advent Bay June 20, 1896, and here their inland explorations began. Almost immediately it was found that instead of hard rocks and frozen soil, capped inland by a continuous ice sheet, the region to be explored consisted of a congeries of hills composed of rotten and disintegrated material affording neither hand nor foothold. In various places large, nearly level, deeply crevassed glaciers impinged upon the valleys or lowlands, covered with a mantle of snow or slush which, under the continuous arctic daylight, maintained a semi-fluid condition calculated to allow the limbs of man or beast to penetrate indefinitely. From the deliquescent margins of these glaciers issued streams of water which spread out over the boggy lowlands, saturating them until they formed little more than a series of unbroken quagmires, with here and there a patch of sedges and other arctic vegetation. Unprovided with suitable snowshoes, or sledges appropriate to the conditions, our explorers floundered through mud, slush, and water with all the annoyances incident thereto. The record of their experiences appears to exhaust all conceivable aspects of the combination of mud, water, ice, men, and ponies. The tale, in fact, becomes wearily monotonous long before the record is exhausted.

To sum up, the party explored the region about Icefiord and its arms, Advent and Sassen Bays; crossed the island between Sassen and Agardi Bay on the west coast; ascended many hills, none reaching the minimum mountain height of 3,000 feet; and surveyed an area of about 600 square miles in a fashion sufficiently accurate for all practical purposes. Subsequently, in a little twelve-ton launch, they visited the northwest, north, and northeast shores of Spitsbergen, entering many of the fjords, and seeing the whole western coast of Northeast Land. On the 16th of August they sailed for Hammerfest, arriving in time to welcome Nansen back to civilization.

As a piece of literature, the book is overloaded with uninteresting personal detail, though it is a decided improvement on Conway's account of his work in the Himalayan region. It is difficult to make interesting a narrative in which the explorer is chronically up to his knees in mud and water. There are many sketches and a multitude of "process" pictures, mostly very similar to one another, and none of them strikingly picturesque. To accommodate them the book is printed on heavily weighted paper, which makes it impossible to read for more than a few minutes without a book-rest. The publisher has done his part handsomely, but the author needs lessons in condensation. A book one-third the size would have easily contained all the novel and essential facts, as well as a sufficiency of pictures. It would then have interested without wearying, mentally or physically. Books of exploration have of late been growing in size quite disproportionately to their intrinsic interest, and the present volume is an awful example. It is quite time somebody called a halt.

Johnsonian Miscellanies. Arranged and edited by George Birkbeck Hill. 2 vols. Harper & Bros.

It is a curious fate that Johnson, the ostentatiously careless, the man impatient of "minute accuracy," as Boswell tells us, should have become the critical preserve of

so painstaking and precise an editor as Dr. Hill. Everybody remembers how Johnson would not correct palpable errors in his Dictionary, when getting out the second edition, on the ground that he "would not flatter" the impudent fellows who had called attention to his blunders. In his Life of Savage he speaks with pitying wonder of that author's "superstitious regard to the correction of his sheets," and thought the anxiety with which he dwelt upon "the minutest and most trifling niceties" something almost uncanny—it "deserved no other name than that of fascination." For such a champion of the off-hand and the inaccurate to have fallen into the hands of a man who, after working three years on the elucidation of these two volumes, looks his labors over only to sigh, "What improvements could be made!" and to confess that "I have never yet finished an index without wishing that by the help of it I could at once reëdit my own editings"—for such an author to have become the chosen subject of such an editor shows what strange turns literary affinities may take.

Still, Dr. Hill might assert that he had found authority for his methods in his author. Writing of Addison, Dr. Johnson said: "Not to name the school or the masters of men illustrious for literature is a kind of historical fraud, by which honest fame is injuriously diminished: I would therefore trace him through the whole process of his education." But such a tracing through the whole process as Mr. Hill has done must have been beyond dreaming of in Johnson's philosophy. One can only think of the question which Mrs. Piozzi once addressed him: "Will *any* body's mind bear this eternal microscope that you place upon your own so?" The same microscope which Dr. Hill had turned upon Johnson in his monumental editions of Boswell and of the 'Letters,' is here applied in close scrutiny to the 'Miscellanies.' Under that name are included the "Prayers and Meditations" (carefully collated with the original manuscript in Pembroke College), Johnson's own bit of autobiography, the "Annals," Mrs. Piozzi's "Anecdotes," Murphy's "Essay on the Life and Genius of Samuel Johnson," together with a vast range of "Anecdotes," "Narratives," "Extracts," and "Apophthegms" derived from contemporary writers and diarists. All is beautifully printed and commented upon with what can only be called editing raised to the *n*th power.

Dr. Hill's method aims at both the convenience of the student and the delight of the reader. Swarming cross-references put masses of material before the inquirer and apt illustrations light up the page. Thus Johnson's boast of indifference to criticism at once leads our editor to give us in footnotes the views of Addison, Voltaire, Hume, Scott, and Darwin on the same subject. Chesterfield's not very Chesterfieldian phrase applied to Lyttleton, "a respectable Hottentot," sets Dr. Hill off on notes concerning the early use of that word in English—as if he were writing for Dr. Murray and the Dictionary greater than Johnson's. Besides correcting old material so as to make it almost as good as new through new accuracy, he gives us some unpublished matter (mostly letters) and some extracts from rare sources. One of especial interest to American readers was furnished the editor from Philadelphia, and was taken from a book not in the British Museum, Stuart's 'History of the Rise of the Arts of Design in the United States.' It is as follows:

"Dr. Johnson called one morning on Mr. West to converse with him on American affairs. After some time Mr. West said that he had a young American [Gilbert Stuart] living with him, from whom he might derive some information, and introduced Stuart. The conversation continued (Stuart being thus invited to take a part in it), when the Doctor observed to Mr. West that the young man spoke very good English; and turning to Stuart rudely asked him where he had learned it. Stuart very promptly replied, 'Sir, I can better tell you where I did not learn it—it was not from your dictionary.' Johnson seemed aware of his own abruptness, and was not offended."

Dr. Hill informs us that he turned aside from another task to edit the 'Miscellanies,' at the suggestion of Leslie Stephen. But as the other work was a contemplated new edition of Johnson's 'Lives of the Poets,' we may hope that Dr. Hill will now return to his first intention and thus complete his Johnson cyclus.

Hosea Ballou, 2d, D.D., First President of Tufts College. By Hosea Starr Ballou, Member of Rhode Island Historical Society, etc., etc., etc. Boston: E. P. Guild & Co. 1896.

Mr. Hosea Starr Ballou has brought together a great mass of materials out of which a skilful biographer might have made an interesting and effective story of the life of Hosea Ballou, 2d, but his own performance cannot be so estimated. Interesting his narrative is, but more in spite of the biographer than because of him, so little has he done to exhibit his facts in their due coördination and progression. He had an excellent subject, and has given us many incidents and traits, but they are not combined in any shapely presentation of the man or any adequate account of his most characteristic work, the starting of Tufts College on its honorable career.

Mr. Hosea Starr Ballou's connection with a number of historical and genealogical societies does not much profit him when he sets out to clear up his family pedigree. The line, so far as it is given here, is given confusedly. The founder was apparently Mathurin Ballou, a French Huguenot, who came to Providence in 1646, if not earlier. His Christian name, somewhat varied in the spelling, has been a favorite with his descendants, and to him it is not unlikely that they owe a certain tendency to be off with the old opinions and on with the new; else why did he cast in his lot with the "discordant band of anti-errorists" which gathered together about Roger Williams in the Providence settlement? That there was preaching in the blood as well as heresy is evident. "Father Ballou," the celebrated great-uncle of Hosea Ballou, 2d, had three brothers who were preachers. Hosea, 2d, was born in Guilford, Vt., in 1796. He had no college education, but studied theology with Father Ballou in Portsmouth, N. H. He began to preach before he was twenty-one, and in 1817 was settled as minister of the Universalist Church in Stafford, Conn., the only Universalist church in the State. His habit was not only studious, but scholarly, and in Roxbury and Medford he attracted to him many young men as special theological students—a method which had been much in vogue in all the New England sects and which had great advantages. We have an interesting chapter about these students, one of whom, Starr King, had for Dr. Ballou the warmest possible regard. Relating an imaginary visit to Gehenna he said, "Not daring to go alone, I obtained the guidance of Dr. Ballou, knowing that in his society I should be safe from evil spirits."

Dr. Ballou was very influential in helping on the formulation of Universalist thought, and in freeing it from the more obvious crudities which it had taken up from the doctrine of Father Ballou, and more especially from that of John Murray, who, not inaptly, might be called the grandfather of American Universalism. Dr. Ballou's principal contribution was a 'History of Ancient Universalism,' of which Origen was, of course, the figurehead. His scholarly reputation and his residence in Medford made it inevitable that, when Charles Tufts resolved to "set a light on that bleak hill" on which Tufts College now stands, Dr. Ballou should be used to initiate the enterprise. Moreover, he had been one of the most strenuous in the demand for denominational education. The story of his presidency has much of the pathos which inheres in all the small and brave beginnings of enterprises that attain to dignity and power. The contrast between those beginnings and the present standing of Tufts is well brought out. It was a happy fortune for the institution to have for its first President a man whose character will shed a benignant ray on its whole history, however long and honorable it may be. Many estimates of his character are given, some of them pardonably extravagant, while the most infelicitous is that of Dr. Oscar F. Safford, who says: "His name among Universalists is like that of Socrates in the world of letters."

Kajakmänner: Erzählungen Grönländischer Seehundsfänger. Herausgegeben von Signe Rink. Berlin: S. Fischer. 1897. 8vo, 214 pp.

It would generally be supposed that if books by civilized people about Greenland and the Greenlanders were excluded, an account of Greenland literature would resemble the celebrated chapter on snakes in Iceland. We do not remember seeing, in any of the numerous works in which life in Greenland is described, any intimation that a printed literature, written by Greenlanders for Greenlanders to read, has ever existed. Previous to 1850, the only printed books in the Greenland dialect were of a religious or educational character—Testaments, hymn-books, primers, etc., with a few translations into Greenlandic of stories selected from European literature and suitable for reading-lessons. In the next decade the number of works of the latter class was increased, always with a view to their use in the theological training-school for natives at Godhaab. Only three really popular works were available for Greenlanders up to 1860, namely: Wieland's 'Oberon,' and the 'Holger Danske,' and 'Räst i Orkenen' of Ingemann, manuscript translations of which had been made and passed from hand to hand until they literally dropped to pieces.

The universal popularity of the ancient legends orally transmitted from one generation to another, of which a selection has been printed by the late Dr. Henry Rink ('Tales of the Eskimo,' with illustrations by native draughtsmen), indicated a taste for literature among the people, and in 1861 the

first printing-office was established in Greenland. It was planned by Dr. Rink to print an annual volume, the work being done during the winter months, so that the bound copies might be ready for distribution when the season of navigation opened at the beginning of summer. Dr. Rink, being at that time Governor of South Greenland, had unusual facilities for carrying out the project. The Greenlanders throughout the region were requested to send in contributions, out of which the periodical should be made up, such as descriptions of their adventures, hunting by sea or land, or, in fact, original contributions of any kind. The publication was entitled *Atuagagliutit* (literally, "A means by which to induce people to read"), and proved a complete success, having now been regularly issued for thirty-five years. It is edited, illustrated, printed, bound, and published by one man, a native, Lars Möller Arkaluk, who is not unknown to travellers in Greenland. The annual is distributed gratis throughout the colonial administrations, which receive yearly from Godhaab a certain number of copies for distribution in their respective districts, in return for which voluntary contributions flow in to the editor from all parts of the country.

From these simple tales Madame Rink has made a selection, believing that it would have not only an interest for civilized readers, but also some scientific value, as an illustration of the first and only collection of independent Greenland literature, illustrating the lives, customs, and intellectual status of the present Greenland people in the manner of the tales published by her lamented husband respecting their less civilized forefathers. The work was originally written in Danish, but the German translation above cited will be more accessible to most readers. The book contains seventeen sketches or tales, all of which, notwithstanding their apparently Scandinavian authors' names, were written by native Greenlanders. Owing to the differences of construction between the two languages, an absolutely literal rendering was impracticable, but only such modifications have been made as would be necessary on this account, and obscure points are cleared up by the editor's foot-notes. We believe that Madame Rink's little book should find a welcome, not merely from ethnologists and psychologists, but also among those who enjoy the illustration of our common humanity wherever found, even among the glaciers of the frozen north.

The Chances of Death, and Other Studies in Evolution. By Karl Pearson. Edward Arnold. 1897.

In two handsome volumes, amounting to more than 800 pages, that most militant of modern mathematicians, Prof. Pearson, keeps up the tradition of a certain class of scientists by making his modest contributions to omnisciolence. His topics are various, but they may be grouped under three heads. The first exhibit Prof. Pearson as the statistician and constructor of diagrams and frequency curves, and display a robust faith in his powers of manipulating a material which is proverbially treacherous and is often admitted by him to be qualitatively and quantitatively inadequate. His most suggestive results under this head are that 27 per cent. of the married population produce 50 per cent. of the next generation, that society at present recruits itself from below, and that consequently we are threatened with a survival, not of the fittest, but of the most fertile. He also has some interesting remarks on the woman question. Perceiving that the "new woman" cannot flourish unless she can get effective protection against the disabilities of childbirth, he holds there should be an outcry for "some form of national insurance for motherhood" (i., p. 253). This, however, he is confident woman will secure in the socialist state of the future, the inevitable advent of which he paints in the usual optimistic colors. He also defends woman against the attempt of modern biologists to deprive her of her proud preëminence in variability, and denies, on the strength of a laborious analysis of elaborate statistics, that man has been shown to be more variable—a result that should go far to rehabilitate the reputation for scientific accuracy and caution of the royal poet who declared that "souvent femme varie."

The essays of the second class are polemical, and are directed against the anti-scientific and anti-liberal doctrines, as the author esteems them, of Kidd's 'Social Evolution,' Lord Salisbury's British Association Address, and Arthur Balfour's 'Foundations of Belief.' It cannot be said that Prof. Pearson is at his best as a controversialist; for though he can hardly help making some points, he gets too angry with his opponents and is too liberal of abuse, and so in the end he by no means always succeeds in bringing out the enormity of their offences against the spirit of science. This last failing is perhaps most conspicuous in his attack upon Mr. Balfour, whom he takes to task severely for treating as a positive dogma of science what is merely a use of convenient conceptual formulas. No doubt "science" ought never to be more than a description of the concrete in terms of the abstract (for purposes of practical manipulation of the former), and should leave assertions about the ultimate realities which correspond to its formulas to metaphysics. But unfortunately, in ordinary life habitually and in science generally, we unwittingly turn our science into metaphysics, and so need a philosopher to point this out to us; in fact, it would not be altogether easy for Prof. Pearson to clear himself of the charge of sinning with the rest. Hence Mr. Balfour's criticism of the dogmatizing of the methods of science is by no means inopportune, while it must be considered a great mistake to give a political twist to the discussion of question-begging remarks about "reaction" and "the new bigotry." We suppose that when Prof. Pearson makes himself familiar—as for the good of his soul it may be hoped he will do speedily—with the very similar attitude towards the methods of science exhibited in Prof. James's new book of essays, 'The Will to Believe,' he will also resent, as a reactionary outrage to science, what is merely open-mindedness, and cannot by any possibility be brought into connection with the party strife of British Liberals and Conservatives.

In his third section, comprising the whole of the second volume, Prof. Pearson turns anthropologist, and discusses the traces of "matriarchy" and "endogamous group-marriage" among Aryan peoples. He is an ardent believer in the discovery of civilization by primitive womanhood, and draws a vivid picture of the early matriarchy, with its mother-goddess, communal life, and "sex-festivals." The evidence which he adduces for this state of things is derived partly from folklore—he argues that the *Mährchen* date back to such a period, and that the witch was but the degraded priestess of a superseded cult—and partly from philology. But though his researches are laborious and his arguments are frequently ingenious, he does not manage to keep clear of two fallacies which almost always beset the reasoning of his school. The one consists of the assumption that the ancient Aryans were savages, and that we have a right to expect to find in their language and customs "fossils" of truly primitive life. Yet it is quite clear that, geologically, the Aryans are a very recent stock of comparatively civilized warriors, and that an argument which ascribes to them the practice of general promiscuity less than 2,000 years ago proves altogether too much. Yet this is what Prof. Pearson does, *e. g.*, in his derivation of the witches' cats from their sacredness to the mother-goddess of matriarchal times, in spite of the fact that these animals were late importations from Egypt in northern Europe. And, secondly, we find also the assumption that the various forms of sexual relation must have succeeded each other in an orderly evolution, and cannot have coexisted. Judging by the facts of the present day, nothing seems more improbable—unless, possibly, it be the supposition that in a rude age the strong could ever permanently have submitted to be deprived of the exclusive ownership of their wives and children by a social prejudice in favor of promiscuity. The universality of matriarchy can never be established by sporadic traces of past promiscuity. We have no right to argue from the practices of the common people to the habits of the chiefs. And, inasmuch as the Aryans were a ruling race, and the "patriarchal" system was, as Prof. Pearson admits, more efficient and therefore survived, and since, moreover, there is such a thing as "reproductive selection," which in ancient times probably recruited society from above rather than from below, the anthropological evidence does not as yet really render untenable the view that modern man, with his decidedly monogamous instincts, is predominantly descended from the tribes, or classes within the tribe, which were always substantially monogamous in their habits. On the other hand, malice might suggest that the life of the minority and the interest taken by some in the *chronique scandaleuse* of anthropology afforded prima-facie proof of descent from the lower strata of early society.

The Out-of-Door Library: Angling. Hunting. Athletic Sports. Mountain Climbing. Charles Scribner's Sons. 1897.

These four volumes are composed of thirty-two articles, by nearly as many different authors, that have appeared in *Scribner's Magazine* between July, 1887, and September, 1896. In most cases the illustrations have not suffered from the necessary change in size; the text is worth reprinting; and with large type, heavy paper, and an appropriate cover of dark green, the publishers have made an attractive set of books. Their title, however, is somewhat of a misnomer. They do not tell us how to fish, to hunt, to engage in athletic sports, or to climb mountains. They are not that much-desired series of carefully written monographs on the various phases of American out-door life, a second Badminton Li-

brary prepared from the cis-Atlantic standpoint. They are best read at home, and need not be taken into camp. Mr. Rogers's adventure with the wounded grizzly, and Mr. Grant's capture of the tarpon—to cite two out of many equally interesting papers—can hardly fail to quicken one's pulse and kindle one's enthusiasm as he sits by his fireside. Yet the various chapters, with the exception of that on surf-bathing, do not render much assistance when one starts to put into experience the inspiration they have aroused.

This is particularly true of the volume on mountain-climbing. The nature-lover who reads Mr. Wilson's picturesque account of the birth of a snow-squall over Tuckerman's ravine, his description of the fascinating forms of the huge frost feathers that grow on Mount Washington, and the glories of the winter sunsets and the wondrous sundogs to be seen there, resolves forthwith to visit the "crown of New England" while it is adorned with its ermine robes. On perusing the chapter again, he is perplexed to find on page 5 that "it would be madness to make the winter visit at the present time, however, for the Government station has been abandoned, and there is no place of refuge there"; while on page 52 he learns that "a winter ascent should not be attempted without a careful guide." Nowhere is stated the essential truth that one unused to snow-shoes and unable to make both the ascent and descent in one day without excessive fatigue, has no right to be on the mountain in winter, whether a house of refuge is open or not. Since the signal station was closed the summit has been visited in midwinter by an increasing number of tourists, and the entire Presidential range has been repeatedly traversed by amateur climbers. The reward is great, the danger lies in the weather. Having some skill with snow-shoes, and a thorough knowledge of the range, a good walker can witness in safety a sunset from the summit any fortnight in the year, provided he has the self-control to turn back at the first indication of an approaching storm.

Educational.

CALIFORNIA, Belmont. (In the foothills near San Francisco.)

BELMONT SCHOOL for Boys hopes to deserve the confidence of Eastern as well as of Western parents by surrounding its boys with as stimulating an intellectual, spiritual, and physical life as is found in the best Eastern schools, and by offering a home which in beauty of surroundings and fineness of climate for sustained work no Eastern school can hope to equal. To this end it is equipped with every needful educational, sanitary, and recreative appliance to fit boys for the best colleges and technical schools, and it should give to them a healthful impulse towards good thinking and good living, and leave with them a heritage of pleasant and helpful memories. The catalogue, containing views of the school and a record of the colleges and technical schools entered by its graduates, will help to give an idea of its spirit and the work it is doing

[*Educational continued on page 78.*]

Practical. Popular. Scientifically Exact.

Treats of the science and the art of gardening, and is a trustworthy record of progress in horticulture. The weekly issues contain practical directions for cultivation under glass and out of doors, correspondence on seasonable topics, editorials and articles on forestry, and on legislation affecting the national forests. The contributors are botanists and specialists of the highest standing. The illustrations are original, accurate, and artistic.

"Winning, delightful, and accurate."—*N. Y. Tribune.*
"Wise, intelligent, entertaining."—*Harper's Weekly.*
"Rich variety of remarkable engravings."—*N. Y. Post.*
"Dignified, pleasing, scholarly."—*Chicago Evening Journal.*
"Foremost journal of its class."—*Boston Herald.*

Beautifully illustrated. Weekly, $4.00 a Year

Specimen copy free on application.

Garden and Forest Publishing Co

Tribune Building, NEW YORK.

NEW BOOKS PUBLISHED BY THE MACMILLAN COMPANY

FOR THE YOUNG FOLKS. *JUST READY.*

CITIZEN BIRD: A Story of Bird-Life for Beginners.

By MABEL OSGOOD WRIGHT, *Author of "Birdcraft," "Tommy Anne," etc.* and Dr. ELLIOTT COUES, *Author of "Birds of North America," etc.*

Cloth, 12mo, $1.50.

Illustrated with Drawings from Nature by LOUIS AGASSIZ FUERTES.

A charming story for the young people, which contains not only much information about the life of birds in general, but also a guide to all the chief varieties of North American birds, their habits, economic value, etc.

The Rural Science Series.

Edited by Professsor L. H BAILEY, *Cornell University.* Two volumes.

The Principles of Fruit-Growing.

Fundamentals Common to all kinds of Fruit-Growing.

By Prof. L. H. BAILEY, *Professor of Horticulture, Cornell University.*

Cloth, 12mo, $1.25.

The Fertility of the Land:

A Discussion of the Relationship of Farm Practice to Saving and Augmenting the Productivity of the Soil.

By I P. ROBERTS, *Director of the College of Agriculture, Cornell University.*

Fully Illustrated. $1.25.

Genesis of the Social Conscience.

The Relation between the Establishment of Christianity in Europe and the Social Question.

By HENRY S. NASH, *Professor in the Episcopal Theological School, Cambridge.*

Cloth, 12mo, $1 50.

"Professor Nash's volume fulfils the promise of its title. It does more, indeed, for the author is something more and better than a mere epitomizer of other men's thoughts. Not only is his treatment of the great thesis which he has undertaken to discuss free and suggestive, but he shows himself to be a clear and original thinker."—From *The Tribune*, New York.

The Myths of Israel.

The Ancient Book of Genesis, with Analysis and Explanation of its Composition.

By AMOS K. FISKE, *Author of "The Jewish Scriptures," etc.*

Cloth, 12mo. $1,50.

The author resolves the ancient Hebrew Book of Genesis into its component myths, explaining their significance and bearing in the literary and religious development of the Hebrew people.

The Social Teachings of Jesus:

An Essay in Christian Sociology.

By Professor SHAILER MATTHEWS, *Chicago University.*

Cloth, 12mo. *In Press.*

It is based on the belief that Jesus as a strong thinker must have had some central truth or conception. Starting with this fundamental conception, the author endeavors to trace its application by Jesus himself to various aspects of social life.

NEW NOVELS FOR SUMMER HOLIDAY READING.

The Grey Lady.

By HENRY SETON MERRIMAN.

"Deeply interesting, original, and cleverly constructed."—*The Oakland Tribune.*

"Presented with genuine skill and humor."—*New Orleans Picayune.*

The Choir Invisible.

By JAMES LANE ALLEN, *Author of "A Kentucky Cardinal."*

Cloth, cr. 8vo, $1.50.

"Intensely dramatic."—*Boston Daily Advertiser.*

In the Tideway.

By FLORA ANNIE STEEL, *Author of "On the Face of the Waters."*

Cloth, 16mo, $1.25.

A Rose of Yesterday.

By F. MARION CRAWFORD, *Author of "Casa Braccio," etc.* Cloth, Crown 8vo, $1.25.

Mr. Crawford is, as ANDREW LANG says, "the most versatile and various of modern novelists. . . . A master of the narrative style, he throws a subtle charm over all he touches." Mr. Allen, also, so Bliss Carman writes, is "one of the first of our novelists to-day," with "a prose style of wonderful beauty," while Mrs. Steel's new book is described as "a piece of evenly brilliant writing."

SHORT STORIES,

In the Land of the Snow Pearls.

Tales of Puget Sound.

By Mrs. ELLA HIGGINSON.

Cloth, cr. 8vo, $1.50.

Old Times in Middle Georgia

By the Author of "Dukesborough Tales."

By R. MALCOLM JOHNSTON.

Cloth, cr. 8vo, $1.50.

Each of these volumes is a picture of life in one section of the country, very successful in preserving the local atmosphere. As the Detroit *Free Press* says of the tales of Puget Sound, "there is not a dull story in the book." To Mr. Johnston we owe the permanent possession of a view of life which now belongs to a vanished past.

OF INTEREST TO ADVANCED STUDENTS AND COLLEGE GRADUATES.

C. A. DUNIWAY, Harvard, Editor-in-Chief.

ADDRESS

THE MACMILLAN COMPANY, 66 Fifth Avenue, New York.

The Nation.

NEW YORK, THURSDAY, JULY 22, 1897.

The Week.

While Chairman Dingley was explaining on Monday how the House conferees on the tariff bill had got the better of the Sugar Trust, Wall Street was betting millions of dollars that the Sugar Trust had got the better of Dingley and of the United States of America—betting and putting up the money. It is impossible for anybody but experts to understand what is meant in the way of protection to the sugar-refining monopoly by the conference report on this subject. Dingley himself does not know, but the sugar-refiners and speculators knew perfectly well, and when they put up the price of Sugar stock 11 points in a single day, it may be assumed that they had good reasons for doing so. In the babel of tongues at Washington an idea seems to prevail that the Trust and their speculative following, including Senators themselves, are trying to make it appear that they have won a victory when they have not; that they are boasting on the streets and in the hotel corridors how they kept up the fight in the conference and finally got all that they expected, with a mere change of words which was not a change of substance. Such boasting, of course, excites the ire of the Dingleyites, and they "hurl back" the insinuation.

Undoubtedly there will be much hurling of charges and epithets on the stump this fall apropos of the sugar tariff, but all arguments will sink out of sight in presence of the fact that when the present Congress took hold of this subject American Sugar Refining common stock stood at 110, and that when the conference report was made it stood at 146. Result: net gain of 36 points on $37,000,000 of stock, mostly water, or a gain of $13,000,000. It may be said, and it is doubtless true, that a large part of this gain is due to the stock of sugar that these people have imported in advance. For this also Congress is responsible. The McKinley bill of 1890 set out with the proposition of a free breakfast table, a free sugar-bowl, and all that. The Dingley bill has ended with a tax of nearly two cents per pound and a bonus to the Sugar Trust of $13,000,000 in one lump. That is a free sugar-bowl with a vengeance. The truth is that the sugar-refiners do not need one atom of protection and ought not to have it. The one-eighth differential that the Dingley bill proposed was a sheer gratuity, all the more outrageous since the Trust itself was a confessed monopoly. Even if we allow Mr. Dingley's claim that he has defeated the unholy conspiracy in the Senate, he has still to answer the charge of putting an unnecessary burden on the consumers of sugar for the benefit of millionaires. The only excuse for this act is that he was obliged to do this in order to make the bill consistent with itself. That is to say, the bill was a device to make a distribution of the national earnings among private individuals, with the possible chance of getting some more revenue for the Government, and it would not be fair to leave out anybody who had contributed largely to the funds of the last campaign.

Mr. Dingley finally abandoned his absurd contentions about books, and consented to allow their free importation when twenty years old or when printed in languages other than English. It must have been hard for him to drop his powerful argument that we printed in this country "an abundance" of books in foreign languages. But we are too much pleased to see the proposed tax on knowledge disappear to care very much who plucked this feather out of Mr. Dingley's headdress. The tax on art is still proudly waving in it, however, and this should be enough to reconcile the party of intelligence to free books. Free books and free art too would be a concession to the educated and to the interests of popular culture quite indefensible on the stump.

The Paris award as printed on page 112 of the Diplomatic Correspondence of 1894, shows that there is no requirement or even advice to either of the parties to maintain ships in the waters of Bering Sea. The first article provides that the Governments of the United States and of Great Britain shall forbid their citizens and subjects respectively to kill, capture, or pursue at any time or in any manner whatever the animals called fur seals, within a zone of sixty miles around the Pribilov Islands, inclusive of the territorial waters. The second article says that they shall forbid their citizens and subjects to kill, capture, or pursue in any manner whatever, during the season extending each year from the 1st of May to the 31st of July, both inclusive, the fur seals on the high sea in the part of the Pacific Ocean, inclusive of the Bering Sea, which is situated to the north of the 35th degree of north latitude and eastward of the 180th degree of longitude from Greenwich till it strikes the water boundary described in article i. of the treaty of 1867 between the United States and Russia, and following that line up to Bering Straits. The remaining articles provide that only sailing vessels shall be employed in the fur-seal fishery, that nets, firearms, and explosives shall not be used in said fishery, that these regulations shall remain in force until abolished or modified in whole or in part by common agreement between the Governments of the United States and Great Britain, and that the regulations "shall be submitted every five years to a new examination, so as to enable both interested governments to consider whether in the light of past experience there is occasion for any modification thereof." These are the only provisions of any importance, and the only ones of which we need to take account in the present controversy. There is no provision requiring any patrol whatever. If any subsequent agreement has been made between the two governments in reference to a patrol, it evidently did not specify any particular number of vessels, since no such number is mentioned in Mr. Sherman's alleged dispatch. Yet that despatch conveys to the mind of the uninstructed reader the idea that Great Britain has violated her duty in this behalf—not what we consider to be her duty, but a duty expressed and defined in the award; which is false.

If the announcement by the *Tribune's* Washington correspondent a fortnight ago that the President intended to make wholesale modifications in the civil-service rules was put out as a "feeler," it has not taken long to show that the country would not condone such a repudiation of the most binding personal and party pledges. The *Tribune* itself upon reflection has become convinced that the step proposed would be a dreadful blunder. In an excellent article on Wednesday week it exposed the humbug of the spoilsmen's talk about Cleveland's "midnight order," pointing out that it was issued on the 6th of May, 1896, "and met with the general commendation of the press of both parties, including the *Tribune*"; showed that even if the charges of partisanship in the Government Printing-Office are true, they constitute no argument for abolishing the competitive system, since "the power to dismiss men and fill their places by impartial examination—thus at once rebuking favoritism and vindicating the merit system—may give a satisfactory solution of the difficulty"; justified the present inclusion of chiefs of division in the classified service; and concluded with the declaration that "the extension of the merit system is a Republican policy, and spoilsmen might as well reconcile themselves to the fact." This is the right sort of talk, and will show Mr. McKinley how utterly inexcusable and indefensible would be the surrender to the spoilsmen which

he was reported to be on the point of making.

"Labor" has been insisting that it was high time it got some "recognition" from the Administration, and on Saturday Mr. McKinley tendered it the nomination of the notorious Powderly as Commissioner of Immigration. But "Labor" is more indignant with the President now than before he had done anything for it. The Central Labor Union, at its meeting on Sunday, adopted a resolution declaring that the nomination of Powderly "is the greatest official insult ever offered by the federal Government to organized labor." The President of the American Federation of Labor explains the opposition by saying that "Powderly is not a man who is in touch with the labor organizations of this country, or who can be trusted in a position of such responsibility." But neither does his nomination command the endorsement of people outside the ranks of these organizations, since everybody knows that he would never have been thought of as Commissioner of Immigration except for his claims as a representative of "Labor."

The new Librarian of Congress has at least shown that he knows the absolute need of expert knowledge in his chief subordinates, even if the President was willing to overlook that requirement in his own appointment to the head of the Library. Mr. Young evidently perceives that there are positions into which the ordinary politician's man could not be put without bringing disaster to the whole institution. His choice of Mr. Hutcheson to be in charge of the reading-room was made strictly on the standard of merit, and so was his appointment of Mr. Solberg, announced on Monday, to be Register of Copyrights. This official has varied duties to perform requiring technical skill and executive capacity beyond the ordinary; and Mr. Solberg's training and studies and writings prove him to be a master of the intricacies of copyright law. He will, as Register of Copyrights, have to answer all communications relating to the subject (now numbering, it is said, about 140 letters each day); to record, index, and classify all copyrights granted; to receive, receipt for, and deposit all moneys transmitted for copyright (upwards of $50,000 annually); to prepare the weekly catalogue of title-entries of copyrighted articles; to take charge of copyright business with citizens of foreign countries; with many other kindred matters. The unusual attainments obviously needed for the proper discharge of all these duties are possessed by Mr. Solberg in so eminent a degree as to make his appointment ideal. It must be set down greatly to the credit of Librarian Young.

The platform adopted by the National League of Republican Clubs, a notorious organization of office-seekers, contains an extraordinary assortment of absurd and mischievous propositions. Most political platforms contain some suggestions of statesmanship, some recognitions of the existence of rational principles of legislation, some endorsements of established rules of political wisdom. These asseverations may be perfunctory, but they at least throw a mantle of decorum over the low and selfish purposes of politicians. But the platform of this League contains nothing to which the epithet statesmanlike could be applied without doing violence to language. It would be regarded as a discreditable production by any backwoods debating society, and in its complete omission of everything rational and inclusion of all that is dangerous, it is perhaps unsurpassed. The mere enumeration of its "planks" is enough to discredit it with all unbiassed citizens. As to the achievements of President McKinley and a Republican Congress, they enumerate two, and two only, and these they praise without stint—the sending a Monetary Commission abroad to keep up the agitation for bimetallism, and the presentation of a scheme for seizing the Sandwich Islands. For the future, they propose intervention in Cuba, discriminating duties on freight brought here in vessels of foreign ownership, a bounty on beet-sugar, woman suffrage, "modification of the civil-service law," and the exclusion of "unworthy" immigrants. We venture to suggest to intelligent Republicans that they should compare this programme with that adopted at the same time in Kentucky by the National Democrats. It will be an exercise that may involve some humiliation of spirit, but the results cannot fail to be salutary.

The resolutions adopted by the bankers of New York State at their annual convention in Saratoga on Friday have the true ring. They do not mince matters or deal in roundabout phrases. They recommend the retirement of all Government paper and the substitution of a safe bank currency under Governmental control. The time has gone by when there was anything to be gained by the policy of silence or of half-measures on the part of the banks. At this time, when the politicians at Washington are eating their own words and shrinking from any reform whatever, firmness of tone is more than ever necessary on the part of those who understand the dangers of the present currency system. The New York bankers know that the policy of timidity never makes friends or accomplishes any good in this world. Hence they have spoken the truth with clearness and emphasis. For so doing they are entitled to the thanks of all intelligent men, whether Congress agrees with them or not.

The report of the Bureau of Statistics on the export and import trade of the United States for the fiscal year ending June 30, makes in many respects the most remarkable showing in our history. The country's merchandise exports during the past twelve months have outrun all precedent. They cross the billion-dollar mark for the first time since 1891, and exceed the total even of that year by $21,708,943. The year's enormous total of exported merchandise, $1,051,987,091, passes no less than $169,380,153 beyond the total in the fiscal year 1896. Simultaneously the country's import trade has decreased $15,350,769 from 1896, and falls $102,000,000 below the total of 1893, the maximum in our history. As a result, the excess of exports over imports rises this year to $287,613,186; a balance twenty-three millions greater than the highest previous record—that of 1879—and nearly eighty-five millions in excess of 1892, a year comprising the enormous cereal exports after the foreign harvest failure. But for the abnormally heavy import movement since last March, forced by the threat of increased customs duties, the balance in our favor would be very much greater. Had imports during March and the three ensuing months continued, as they usually do under normal circumstances, in a volume no greater than the February import movement, the total export balance for the fiscal year would have exceeded $394,000,000.

It is hardly necessary to add that exporters were greatly helped by the tariff act of 1894, which, with all its imperfections, gave raw materials on advantageous terms to some of our most important industries. How widely the extension of export in manufactures has gone this year may be judged from the fact that up to the close of May (the detailed report for that month is just at hand) exports of machinery increased $7,073,000 over 1896, or 36 per cent.; exports of copper $10,962,000, or 67 per cent.; exports of bicycles $4,740,115, or 340 per cent.; exports of cotton-seed oil $2,559,000, or 50 per cent.; exports of wood and wooden goods $6,299,000, or 21 per cent., and exports of cotton cloths $4,923,000, or 10 per cent. The clever search for markets is illustrated by the fact that export of cottons to China and the other Asiatic states ran up $4,975,000 over the year preceding, and that shipments of bicycles to Great Britain itself rose from $324,312 in 1896 to $2,082,963 in the same eleven months of 1893. On the other hand it is evident that consumers in the United States have faced the problem of hard times with courage and honesty, and have cut down heavily on luxuries. Such shrinkage, during the eleven months ending May 31, as the $3,487,000 decrease in imports of jewelry, the decline of $8,-

791,000 in raw silk imports, and of $3,266,000 in imports of manufactured silk, with the fall of nearly a million dollars even in import of foreign-made gloves, is conclusive on this point.

The Supreme Court of Kansas has just come to the rescue of the people from the serious trouble threatened by careless law-making in that ill-ruled State. The last Populist Legislature passed a bill which was designed to repeal many redundant, obsolete, and inoperative provisions, about 300 pages of which had accumulated on the statute-book. After the session had closed, the discovery was made that, if the new law should stand, it would abolish half-a-dozen judicial districts, embracing many of the most populous counties in the State, and involve the courts in great confusion. The matter was carried to the Supreme Court, and that tribunal was fortunately able to set the law aside as plainly unconstitutional, since it contained a multiplicity of subjects which were not expressed in the title, whereas the Constitution expressly provides that a bill shall contain only one subject, which must be so expressed. An amusing feature of this decision annulling the action of a Populist Legislature is the fact that it was rendered by the new Populist Chief Justice, who has earnestly protested against the encroachments of courts and their tendency to defeat the will of Legislatures by a resort to technicalities.

The attention of Mr. Bryan and ex-Gov. Altgeld should be called to an extraordinary revelation of the enormities of the "money power" which has recently been made in England. A select parliamentary committee appointed to inquire into the practices of money-lenders had before it Isaac Gordon, a native of Russia and still a Russian subject, but who has resided in England for some fifteen years. This enterprising person carried on business in several different places and under eight different names, his reason, as he frankly stated, being that if he traded under the same name everywhere, his customers "would not be likely to enter the trap again." The plan seems to have worked very well in some ways, as one unfortunate dressmaker borrowed from Gordon three times, supposing that she was dealing with three different money-lenders; but as she eventually became bankrupt, the profits of the transaction were not as large as the rate of interest would indicate. Another customer borrowed £395, and, after repaying £445, became bankrupt, being still indebted in the amount of £362, of which Gordon succeeded in recovering more than three-fourths. The witness displaying some signs of pleasure in relating this transaction, the chairman severely observed that he seemed to be delighted at his customers' bankruptcy, to which the witness cheerfully replied: "Oh dear, no. It is only a matter of business."

Mr. Gordon testified further that he exercised much discrimination in selecting loans. Clergymen he had dropped; "they were an awful lot." Young officers and undergraduates he would none of; nor did he condescend to the "ignorant, common class," or have dealings with members of Parliament. Women owning annuities and tradesmen were his favorites, and he had sometimes made loans to persons of this class at 3,000 per cent. Security Mr. Gordon never demanded, for the excellent reason that when people had securities they knew better than to come to him. He expressed a willingness to comply with the law if it limited the rate of interest, provided he found business still profitable, but was strongly opposed to having the courts review his transactions. As he admitted that he had been imprisoned for "fraud, or misrepresentation, or something of the sort," his aversion to courts need not excite surprise. It was shared by another witness, Mr. Isaac Samuel (doing business under the name "Fielding's, Limited"), who disapproved of the propensity of judges to calculate interest by the year. If he lent £5 on condition of being repaid £6 5s. in a week, his profit would be 25 per cent., but the courts would call it 1,000 per cent. per annum. This practice tended to create a prejudice against money-lenders, some of whom the witness admitted were beggarly people, who had no money of their own to lend, and charged a commission for introducing borrowers to substantial concerns like his own. Dickens has sometimes been accused of exaggeration, but he left no description of the extortions of usurers that equals the evidence presented before this parliamentary committee. It is probable that a recommendation will be made that professional money-lenders shall take out licenses and give bonds for good behavior.

Some weeks ago the House of Commons, in a moment of hilarity, passed on first reading a bill to extend the suffrage to women. But it fought shy of so much as taking it up on second reading; in fact, showed a disposition to burke the measure altogether. This male cowardice brought out at last the following petition, signed by a number of ladies, and presented in the House on July 6:

"That your petitioners view with indignation and alarm the existing procedure of the House of Commons, which reduces legislation to a mere game of chance, and permits the repeated and insulting postponement of the consideration and satisfaction of the just claims of women to citizenship. Your petitioners therefore humbly pray that your honorable House will so reform your procedure as to secure in the future fair consideration of public questions with some regard to their relative importance, and will on Wednesday, July 7, affirm the right of women to citizenship by passing through the stages of committee and of third reading the parliamentary franchise (extension to women) bill."

An old member rose to ask if a "petition couched in language of this sort ought to be received by the House." The Speaker said it was for the House to say. Then somebody else inquired whether the honorable member who presented the petition was not answerable for its language. Speaker Gully said that honorable members presenting petitions must exercise their own discretion in doing so; and added impressively: "The right honorable gentleman has in this case exercised his own discretion." The bill was withdrawn.

The fate of Greece is discussed in the *Contemporary Review* by Mr. E. J. Dillon in a long and, on the whole, instructive and suggestive article. The truth is that the Government of Greece, like that of the United States, is in such a condition as to make the annexation of outside territory inexpedient. The internal problems are so serious as to demand the employment of all the available political virtue for their solution. But a few years ago the interest on the public debt was "scaled down," while at the same time extravagance prevailed in every department of the Government. The "spoils system" flourishes luxuriantly, and the number of office-holders is frightfully large. The entire adult male population of Greece is about 500,000, and over 17,000 of these are Government functionaries. The army numbers at the highest estimate 80,000 men, but the civilians employed in the War Office are nearly 5,000. The Department of Finance has over 2,700 functionaries; that of the Interior has nearly 4,700. Under such an incubus of public servants taxes have been doubled within a few years, in spite of the repudiation of the debt. As Mr. Dillon points out, the Greeks can hardly be regarded as inferior to the Rumanians; but the Rumanians have succeeded in maintaining a respectable government and in securing material prosperity. It is a deplorable thing that Greece should become tributary to Turkey, as is proposed by the Powers, for no more taxes can be wrung from the people without oppression. But it is clear that the amount of the tribute could be raised without increasing the taxes simply by reforming the Government, and if the exaction of the tribute should have that result, it might eventually be for the advantage of the Greeks. If they will learn to govern themselves, they will have opportunities enough for expansion in the future.

"DIGNIFIED" DIPLOMACY.

The Republican platform called for a foreign policy which, while "firm" and "vigorous," should also be "dignified." Reduced to practice in its four months of being in power, the party's theory of dignified diplomacy seems to be a mixture of deceit and slang-whanging. Secretary Sherman's two exploits up to date are his deception of the Japanese Minister in the Hawaiian affair, and his hectoring letter to Lord Salisbury about the sealing regulations, which an English newspaper characterizes as "an explosion of bad manners," and goes not wide of the mark. Mr. Sherman's method of presenting his case is itself irritating because it imputes bad faith to the British authorities. Thus he says, near the beginning of the despatch:

> "It is not pleasant to have to state that the impartial character which it has been the custom to attribute to the reports of naturalists of high standing, *has been greatly impaired by the apparent subjection of this report to the political exigencies of the situation.* It is further to be regretted that the report was so long delayed that no opportunity was afforded this Government to examine it before the definite and final rejection of the President's proposals, based mainly upon its conclusions, was communicated to me. This conduct recalls the incident which preceded the arbitration at Paris, and which came near rendering that arbitration abortive, when a similar report of a British commission was withheld until after the case of each Government was exchanged and the report of the American commission made public."

"Political exigencies of the situation" is a phrase imputing bad faith. It is a locution not used in diplomacy, except where one party wishes to make the continuance of the correspondence difficult. If Lord Salisbury had used it, it would have been considered impertinent and insulting. If it is not so considered on the other side, it must be because they think that the Americans are not used to refined manners and do not recognize the force of words. After beginning his discourse in this offensive way, Mr. Sherman concludes by saying:

> "We have felt assured that, as it has been demonstrated that the practice of pelagic sealing, if continued, will not only bring itself to an end, but will work the destruction of a great interest of a friendly nation, her Majesty's Government would desist from an act so suicidal and so unneighborly, and which certainly could not command the approval of its own people."

Here we have it again. Not only is the kind of sealing authorized and fixed by the Paris tribunal "suicidal" and "unneighborly," but it "could not command the approval of its own [the British] people." In other words, we know better than Lord Salisbury does what the British people approve of. No wonder that such language results in a polite refusal to reopen the question at this time.

There are some most curious circumstances attending the publication of the document. If it was an explosion, it was an unexpected explosion, and the question is, Who fired the mine? Some weeks ago there was much Jingo chuckling over a forthcoming seals correspondence. It was hinted that Mr. Sherman had written a peppery letter of which the Administration was very proud, and it was said that the whole thing would soon be laid before Congress to show what a "sassing" Salisbury had got. But suddenly there was a cooling down at the State Department. Mr. Sherman had not been so merciless to poor Salisbury, after all. Anyhow, the correspondence would not be given out just yet. You see, there was a very delicate bimetallic negotiation going on in England, and she might not be willing both to change her standard of value and to submit to a public slapping of her face. Besides, Special Agent J. W. Foster was still negotiating about the seals, and he had a notion, foolish but traditional, that to call a man a scoundrel was not the best way to win him over to your way of thinking. Oh no, no inflammatory correspondence would be given out, and President McKinley had a message all written informing Congress that it was "not compatible with the public interest" that the correspondence should be laid before it.

At this interesting juncture, off went the "exclusive" bomb in the very *Court Journal*—we would say the *Tribune*. There was Sherman's letter in all its senile fury—*Sir Anthony Absolute* bursting into diplomacy. Everybody was set guessing how the *Tribune* got it. All the world wondered, too, how the *Tribune* could think the publication of a document which McKinley wanted suppressed a good way to back its friends. The conviction that Mr. McKinley is absolutely wise, great, and good is, we know, firmly entrenched in the *Tribune* office—at least it was until Platt ran off with all the spoils. How could it be wise to give to the public what Mr. McKinley thought it unwise to give? There is a mystery here—perhaps several mysteries.

One ingenious theory is that the Envoy-editor's getting his luncheon every day at Windsor Castle had something to do with the case. Naturally Lord Salisbury would appeal to him for help. The British Premier must, of course, have read the *Tribune's* rebuke of Mr. Foster for being "needlessly aggressive" in his statement of the sealing difficulty, and what more likely than that he should want the *Tribune* to rebuke Secretary Sherman also? Surely a paper edited by so polite a diplomat and such a great favorite with the Queen would expose and resent such boorish manners. In this way, some able reasoners maintain, Secretary Sherman's letter found its way "exclusively" to the columns of the *Tribune*. We hesitate to pronounce judgment on this theory. Unaccustomed as we are to royal circles and the subtle methods of editor-diplomats, we can only record the theory, express our simple-minded wonder, and pass on.

Another theory is that Mr. Sherman himself gave out the letter. He is still fond—perhaps fonder than ever—of seeing himself in print. It would be well, too, to put an end to the unpleasant rumors that his powers were failing. Just read that letter! Could a man in the prime of life be more insulting? Besides, the occasion called for something vigorous. It had just been announced in London that the British Government had declined to reopen the sealing question until the *modus vivendi* should expire in 1898. Declined, have they? Well, at least the country ought to know that the Secretary made faces and shook his fists at Salisbury. Whatever the President might think of what was or was not compatible with the public interest, the main thing was to let the people know that there is life in the old man yet.

A more commonplace and, we regret to say, more likely view is that the *Tribune* was simply carried away by the temptation to score a "scoop." Confronted with a "scoop," the most diplomatic and statesmanlike editor in the world trembles and yields. It may be bad policy; it may offend the President, before whom it is the paper's duty to grovel; it may embarrass the party and make its diplomacy ludicrous rather than dignified; but a "scoop" is so glorious that policy, President, and party have to take second place. This must be the *Tribune's* excuse. It will be sufficient in the newspaper world, but we fear that in the political world it will hardly pass. The many "original McKinley men" on the *Tribune* must sadly think so as they see Platt bagging office after office which they had intended for themselves.

THE LOUISVILLE CONVENTION.

The convention of the National (sound-money) Democrats held at Louisville on July 14 was a success far exceeding the hopes of its promoters. It was in that respect akin to the turn-out of the same party in the recent election in the State of Michigan. In the latter it will be recalled that a few men on the State committee, contrary to the advice of the party leaders, decided to make a separate nomination for Judge of the Supreme Court, merely to keep up the appearance of an organization. To the great surprise of those who had opposed this policy, and of themselves as well, their ticket received nearly 35,000 votes, against less than 7,000 cast for Palmer and Buckner in the Presidential election. This fact proved that at least 28,000 Sound-Money Democrats in Michigan had voted for McKinley. This number taken from Bryan and given to the Republicans was just sufficient to account for the 56,000 majority by

which the latter carried the State. The probability is, however, that a much larger number of Sound-Money Democrats voted for McKinley in the fall of 1896 than voted for their own ticket in the spring of 1897, as the latter election did not attract general interest.

The Louisville convention was remarkable for the number and spirit of those attending it, but no one should have been surprised by the strength and national reputation of those who took the leading part in it. It was well known beforehand that Mr. Carlisle, Mr. Watterson, and Mr. Breckinridge were unswerving supporters of the movement, and that they would never yield an inch to the demands of the silverites. It was not known that the masses who went with them last year were equally firm. The usual result of a party split is a compromise and a coming together of the broken parts. It is much easier to "make friends" after the bitterness of the strife is past, after personal animosities are healed, and after the fact has become clear that offices are not to be gained by fighting each other. Consequently there is always a drift toward peace and harmony after an internal contest which has resulted in defeat. Many predictions had been made that peace and harmony would be found in Kentucky this year. The chances of such a result were greater there than in Michigan because the Kentucky Democrats really forfeited State control and the local offices by their division. United, they were the majority party, whereas the Michigan Democrats were the minority party and had nothing to lose in any case.

When we contemplate the powerful reasons making for "harmony" in Kentucky, we are all the more impressed with the noble devotion to principle which inspires the National Democrats of that State and holds them true to their convictions. At this juncture, when the Republicans are doing everything possible to alienate their Democratic supporters of last year by tariff legislation little short of infamous, such devotion is all but heroic. We express our own admiration for it, and we draw new hope from the promise which these men bring, of the ultimate downfall of both free silver and the robber tariff. Mr. Carlisle is right in saying that those two heresies go together. The Bryanites in both House and Senate have, with a few honorable exceptions, concurred with the Republicans in passing the Dingley bill. That is, they have opposed it in such a way as to secure its passage, and some of them have even voted for it outright. Evidently such men are not to be relied on for any share in the battle royal which is still to be fought in order to emancipate the people from the slavery of protection.

Mr. Carlisle usually makes the best speech of any occasion in which he participates. It was so at Louisville. He said that there was not a genuine Democratic sentiment in the Chicago platform, and that no Democrat was bound by it, no matter how many State or national conventions endorsed it.

"You are here to-day," he continued, "to repudiate it absolutely and unqualifiedly, and to reassert the true doctrines of the party with all these modern heresies eliminated. The paralysis of trade and industry, resulting in the loss of public revenue and in destroying the ability of the people to meet their private obligations, was produced mainly by unwise currency and fiscal legislation, and the return of prosperity has so far been prevented by continued partisan agitation in favor of still more radical and destructive measures on the same subjects. The whole field of domestic industry and enterprise, every calling and occupation in which an intelligent and progressive people can possibly engage, has been subjected to the most searching investigation by trained experts, stimulated by selfish personal interest, to discover useful articles of consumption upon which new or additional burdens could be so imposed by law as to rob the people of their honest earnings, without raising revenue for the Government."

Mr. Watterson said that, "as a political issue, the free and independent coinage of silver at the ratio of 16 to 1 was as dead as African slavery." The splendid rally of the Sound-Money Democrats at Louisville certainly goes far to confirm this belief, for it is only necessary to convince the local politicians in Kentucky and everywhere else that the offices do not lie that way in order to kill it. Let them once understand that the National Democrats intend to stand for their principles, now and for ever, and that their votes are necessary to Democratic success, and the Bryanites will drop free coinage and come back to the principles of Jefferson, Jackson, and Tilden. The Louisville convention is fresh proof of the steadfastness of those who supported Palmer and Buckner last year. It will notably confirm the faith of their friends in other States, and in other cities, too. It will not fail to have its influence in our coming municipal campaign. It has already had its influence in Massachusetts. It will find its echo in every Northern and Western State where an election is to take place this fall. Nothing more hopeful has been seen in the political field during the present year.

THE MINERS' STRIKE AND THE LAW.

The struggle of the coal-miners to secure higher wages naturally arouses the sympathy of benevolent people. It does not appear to admit of question that the wages which these miners have lately received are insufficient for their comfortable support. The prices at which bituminous coal has been sold this year have been such as to render it impossible for capitalists to make a profit out of the business if they paid the miners "living" wages, and it is doubtful if any profits have been made even with the low wages actually paid. This unsatisfactory situation has been brought about by the desperate struggle for business of several insolvent concerns. These concerns have reduced prices below the cost of production, and their solvent competitors have had to lower their prices in order not to lose their own trade altogether. Under these circumstances it seems quite reasonable that the miners should try to make an agreement with their employers to restore prices and wages to normal figures. Were such a restoration accomplished, the beneficial results would be very extensive, and the consumers of coal could not complain of an advance in price sufficient to afford a reasonable compensation to those engaged in its production.

Yet it does not seem to have occurred to the newspaper writers who are now trying to gush with sympathetic zeal for the miners' cause, that the aims of the miners are altogether unlawful. That very anti-monopoly legislation which these same writers have done their best to promote, stands squarely across the path of coal-miners as well as of other persons who think of entering into any agreement to fix the price of labor or of any commodity. It was but a few months ago that the Supreme Court of the United States decided that an agreement among railroad managers "for the purpose of mutual protection by establishing and maintaining reasonable rates" was an illegal agreement. It is not material that the agreement in that case related to freight charges, while the agreement which the miners are struggling to reach relates to coal. The principle is the same, and while there was much doubt concerning the applicability of the anti-monopoly law to railroads, there can be little question that it applies to such a commodity as coal when it becomes an article of interstate commerce, especially since many railroad corporations are engaged in coal-mining.

As Judge Peckham pointed out, the coal-miners cannot be heard to maintain that their struggle is not for the purpose of restraining trade, or for establishing rates above what is reasonable. It would make no difference if they demonstrated that the result of the agreement which they desire would be not only to increase their own comfort, but also to increase trade. Whether the rates of wages which they propose are reasonable or not is quite immaterial. It is the law of the land that any agreement to maintain rates is prohibited by act of Congress, and whatever inconvenience the miners now have to bear is not to be removed by any agreements of theirs. True, the miners might, perhaps, lawfully contract with their employers to accept lower wages than at present. Even the Supreme Court would hardly, unless it should change its mind, hold that such an agreement was in re-

straint of trade, as involving the maintenance of rates. Under some circumstances employers might be pleased to learn that such an agreement was legal, but they would hardly desire it now, and the miners are too near starvation to listen patiently to such an elucidation of their legal rights. They have been assured that the courts were against them, and that the judges were bribed by their employers. When they find it literally true that the Supreme Court has declared illegal all agreements that they may make with their employers for maintaining the price of coal and the wages for mining it, they may reason ably conclude that there is no falsehood in the stories of the venality and hostility of the judiciary.

Some claim may be made that the law still tolerates agreements between the individual workman and the individual master to maintain a fixed rate of wages. It may be urged that wages and prices are different things; that the law is intended to regulate the compensation of capitalists, not that of laborers. An examination of Judge Peckham's reasoning will show that this view cannot be maintained. It may be thought reasonable, but he shows that reason is not to be considered in the construction of an act of Congress. There is no escape from the sweeping rule that any agreement to maintain rates, reasonable or unreasonable, is in restraint of trade, and, therefore, illegal, whether it is made by railroads or grocers or coal-miners.

Were agreements concerning wages excepted, it would make no practical difference. It would be idle for the miners to demand higher wages if the price of coal is not to be advanced. Miners' wages are generally regulated by a "sliding scale"; they vary as the price of coal varies. Nor do the miners desire individual agreements with individual masters. They want rates which combinations of masters shall agree with combinations of workmen to maintain. Such rates, however, the masters can evidently not agree to pay, unless there is some agreement concerning the price at which coal is to be sold. A man might be very quickly ruined if he agreed to pay a specified rate of wages without reference to this price. He might find that it cost him more to mine a ton of coal than he could get for it, and his workmen would soon find that their wages not only were not maintained, but were extinguished altogether.

We are very much afraid that the Governors of the coal-producing States have participated in a conspiracy to encourage acts in restraint of trade. They have been proposing arbitration, with a view of establishing agreements of an unlawful character between the miners and their employers. They cannot plead ignorance of the law, as the miners may, and it becomes them to be extremely circumspect in their recommendations. They must take care to suggest nothing that can be construed as tending to maintain reasonable or stable rates for coal or for coal-mining, for that is a crime. We do not know what counsel the Governors can lawfully give in the present emergency, and can only suggest that a conference of anti-monopoly newspaper writers and legislators should be called to devise expedients for raising miners' wages and decreasing the cost of producing coal at one and the same time. These people have passed laws that leave the miners in a bad legal scrape, and they ought to point the way out of it.

NO ENTANGLING ALLIANCES.

Some of our readers will recall an amusing satire that appeared during Mr. Greeley's Presidential campaign, in which the country was represented as having been conquered by foreign Powers exasperated to hostility by our disregard of diplomatic customs. As Mr. Greeley was not elected, the prophecy was not fulfilled; yet the course of events recently has been such as to make our foreign relations a subject of some anxiety. Were Washington to return to life, he would certainly be reassured concerning one danger, and would admit that his warning against "entangling alliances" had been heeded. With the exception of Venezuela, of whose claims we have somewhat accidentally found ourselves the champions, it may fairly be said that we stand without an ally on either continent. None of the Powers has any reason to regard us with a particularly friendly feeling, and several of them have good reasons for cherishing sentiments of hostility. If such isolation is desirable, we may congratulate ourselves on the success of our diplomats in attaining it.

As to France, the Power with which we have, as our earliest ally, always maintained friendly relations, the evidences of her present irritation are manifest. She has already imposed retaliatory duties on our products, and is only waiting for the passage of the new tariff act to adopt severer measures. Mr. Depew would hardly be called as a witness by those who disapprove of the policy of the Republican party, but he voluntarily testifies concerning an incident which he properly describes as remarkable. At a dinner in Paris which he attended, and at which one of the French Ministers was present, our Ambassador referred to the traditional friendship between France and the United States. "The French Minister, replying, said in substance: 'Yes, we have traditional friendship, and desire to maintain it. But friendship between nations is not sentiment, but acts. If your new tariff excludes our goods from your markets and injures our trade, then you are unfriendly and hostile.' It was a singularly blunt speech for a Frenchman, and plainly said: 'Fine words butter no parsnips for us.'"

The utterances of the German Emperor are not intrinsically of the weightiest character, but his position gives them importance, and when he talks of "the American peril," we need not blink the fact that this means hostility. Back of the Emperor stands a strong party, increasingly aggressive, and as "quick to resent insults" as the chaplain of our House of Representatives prayed that we might be. This party will presently show us that if we propose to discriminate against German beet-sugar, we shall not have the game to ourselves. Nor will the German Government be propitiated by Mr. McKinley's nomination as consuls at important German cities of men who were formerly German subjects. We have a right to appoint whom we please, but this practice has always produced irritation in the past and is sure to arouse resentment in the future. Four of these German-Americans were recently appointed to German posts in one day, and the posts filled are among the most important in the German empire. This is not the way to promote friendly relations with any country, least of all just now with Germany.

The English are doubtless the last people in the world to wish to quarrel with us. They have manifested for many years a very friendly disposition, and have pursued a conciliatory policy under circumstances of extreme provocation. Until recently they supposed that these friendly sentiments were reciprocated, but the Venezuelan episode undeceived them. They learned that, while they had friends in this country, the number of Americans who had been taught to hate them was startlingly great, and that, as Rufus Choate said at the time of the *Caroline* controversy, the thunder of cannon in a war with England was music to which this nation had no great objection to wake up. There can be no genuine friendship under such conditions as these, and when our underbred amateur diplomats attribute the conduct of blackguards to the representatives of the British Government, we need not suppose that a gentlemanly forbearance is any indication of an affectionate approval of our methods. We occasionally see people enduring much indignity in their efforts to quiet a tipsy acquaintance, but true friendship is not promoted in this way.

The "singularly blunt speech" of the French Minister, which Mr. Depew thought so significant, was a repetition of the complaints of the deputation from the South American states recently entertained by our merchants. These visitors acknowledged the courtesy of their hosts and the magnificent possibilities of commerce exhibited by our country, but

they frankly declared that, if the proposals of our tariff-framers were to be enacted, they should return home and advise immediate measures of retaliation. Nor is the spirit that we have stirred up in our neighbors on the north less unfriendly than that aroused in the South American states. The Dominion of Canada has promptly made arrangements to respond to our tariff by duties of its own, and to establish with England that reciprocity in commerce which we have labored to extinguish. The wisdom of this latter step is so obvious that we may expect the relations between the Dominion and the mother country to become increasingly close, while we shall become more and more estranged from both of them.

A few years ago nothing would have seemed more absurd than an alliance between Spain and Japan. That there should be any harmony between the most effete of European Powers and the most progressive of those of the Orient seems incredible; and yet we have behaved in such a way towards both of them as to make their alliance a matter for serious discussion. Our Congressmen have had capital sport with Spain; they have thought her so feeble that we could insult her with impunity, thereby winning much fame for themselves. Not all of them would threaten Japan with so light a heart; that Power recently displayed a combination of pugnacity and vigor that was rather startling. Nevertheless we have taken a step in negotiating the treaty with Hawaii the meaning of which the Japanese understand perfectly well. They are sufficiently astute to know that "friendship between nations is not sentiment, but acts"; and while they are wise enough to keep their own counsel, it is not difficult to imagine what that counsel is.

We are still fortunately at peace with all the world, but, as Senator Hale observed in urging the prompt completion of some more naval vessels, "foreign complications are pressing upon us." These complications are not alliances—north, south, east, and west we may look in vain for a Power, civilized or uncivilized, whom our policy has not tended to alienate and irritate. Some day our statesmen may carry their offensive behavior a little too far, and we may then find ourselves in difficulties which will be witnessed with satisfaction by all the peoples of the earth.

MR. CHAMBERLAIN AND THE RAID.

Mr. Joseph Chamberlain has often been said to be the most American among English public men. He is aggressive, showy, "smart," absorbed in politics as a game. These qualities have sometimes led to his being compared to Mr. Blaine. Another parallel between the two may now be drawn in the conspiracy of which Mr. Chamberlain appears to be the object. Mulligan letters were maliciously used against Mr. Blaine, and Transvaal telegrams are so used against Mr. Chamberlain. The telegrams have been just as fully "explained" as were the famous letters, and yet there are wicked people who say that the Colonial Secretary's innocence of all connection with the Jameson raid has not been shown. Mr. Labouchere has his suspicions, as revealed in his minority report, in which he says that the Parliamentary committee should have probed more deeply into the evidence implicating Mr. Chamberlain.

What is that evidence? Well, it consists partly in the firm conviction of some of the leading conspirators that Mr. Chamberlain knew all about their plans and approved them. Dr. Harris, Rhodes's agent, thought he had clearly given the Secretary to understand the scheme; he swore so, in fact, before the committee, but when Mr. Chamberlain said that he had no recollection whatever of the conversation which Dr. Harris said had taken place between them, the latter said that he was not the man to set his memory against the Secretary's. He was positive, however, that he had "spoken openly" to Under-Secretary Fairfield, Chamberlain's head man; but then, as Mr. Chamberlain astutely pointed out, Mr. Fairfield was very deaf and might not have heard what he said to him, and besides he was now dead, and it was hardly fitting to involve the character of the dead. Dr. Jameson and the English officers who went with him on the raid all thought that Mr. Chamberlain was conniving at their action. Most significant of all, Cecil Rhodes himself was positive that Chamberlain knew his plans and was supporting them.

The proof that Rhodes thought so is various. One item of it is given as follows in the July *Contemporary Review:*

"A Conservative of the highest honor and standing, whose word no one would dream of disputing, was travelling in the Cape and saw Mr. Rhodes. They discussed the matter freely, and Mr. Rhodes told him plainly that Chamberlain was in it up to the hilt. On that authority, the member saw Lord Salisbury, and was ultimately confronted with the Colonial Secretary. 'Who told you I was in it?' said the Minister. 'Rhodes himself,' said the critic. We omit the reply."

The reply was, according to the story current in the House of Commons, "The traitor!" Other evidence of the highest significance is contained in the telegrams sent to and by Rhodes. Here are two of them:

FLORA SHAW TO RHODES.

"17th December, 1895.

"Held an interview with Secretary Transvaal. Left here on Saturday for Hague, Berlin, Paris; fear in negotiation with these parties. Chamberlain sound in case of interference European Powers, but have special reason to believe wishes you must do it immediately."

RHODES TO FLORA SHAW.

"30th December, 1895.

"Inform Chamberlain that I shall get through all right if he supports me, but he must not send cable like he sent to High Commissioner in South Africa. To-day the crux is, I will win and South Africa will belong to England."

Certainly no man could have sent that telegram who was not sure that Chamberlain was "in it up to the hilt." What must have been his surprise, then, when the Secretary declared in the House of Commons, within two months' time:

"It is asked of me, 'Was the High Commissioner, were other people, ignorant of this projected invasion?' I say, to the best of my knowledge and belief, that everybody, that Mr. Rhodes, that the Chartered Company, that the reform committee of Johannesburg, and the High Commissioner were all equally ignorant of the intention or action of Dr. Jameson. That is the belief which I express to the House after having carefully examined all the statements of all the parties concerned."

That was before the ugly telegrams had been "decoded" and put in evidence. It was also before the following letter, written just nine days previous to Mr. Chamberlain's assertion of ignorance in the House, was made public:

"COLONIAL OFFICE, Feb. 4, 1896.

"MY DEAR HAWKSLEY: I told Meade of our conversation, and he said we must at once tell Mr. Chamberlain. We did so, and he requests that you will ask your various clients who have sent telegrams about him or the office to send copies to me through you. He does not recollect saying anything anent the insurrection which was supposed to be impending which he would greatly care about if it became public, but he would like to know as a preliminary matter what it is he and we are supposed to have said. Perhaps, also, you could tell us how much of what was sent from here reached the five, or whatever number it was, and, if so, whether it was in substance or in words. Yours truly, E. FAIRFIELD."

Hawksley was Rhodes's solicitor. He replied next day, "Mr. C. knows what I know, and can shape his course with this knowledge."

All this is a cruel network of evidence to be woven about an innocent man. Mr. Chamberlain may escape with his integrity, but what becomes of his reputation for sagacity? Everybody about him knew what was going on, but he was in blissful ignorance. The explanations given by Flora Shaw are too ingenious by half. She was using Mr. Chamberlain's name without authority. The "special reason" she had for thinking he wanted the raid to come off "immediately" was that she heard Mr. Fairfield say so at the Colonial Office—but, then, he might have been chaffing. Did she "inform Chamberlain" in obedience to Rhodes's telegram? Yes, she did, and at once wired back that Chamberlain was "awfully angry." We should think he might have been. But he points to his anger as a proof of his innocence; it was simply outraged virtue indignant. The situation, however, as far as he is concerned, is well summed up in the dispatch of a correspondent who says that the Transvaal inquiry has resulted in clearing Mr. Chamberlain of complicity, but that no foreign Power

will believe it. Foreign Powers are notoriously incredulous.

The lame and impotent conclusion of the committee of inquiry, its running away from every hot trail it struck, can be accounted for, says the writer in the *Contemporary Review*, only on one supposition:

"There is only one reason that can, with any probability be assigned—that is, that some member of the Government has made a 'Front Bench communication' to the leader of the Opposition, indicating to him explicitly that there are 'reasons of state' for stopping the disclosures. There can be little doubt that this is what has happened; and conjecture, not only in this country, but elsewhere, will naturally be keen to know what the nature of this momentous disclosure was."

MADAME DE GEOFFRIN.—I.

PARIS, June 29, 1897.

M. Pierre de Ségur has just published, under the somewhat singular title, 'Le Royaume de la Rue Saint-Honoré,' a complete Life of the famous Madame Geoffrin. The Rue Saint-Honoré is but a small kingdom, but, under the sway of Madame Geoffrin, the mother of the Philosophers, as she was sometimes called, it became the intellectual kingdom of the eighteenth century. Not that Madame Geoffrin was herself a great thinker; our modern feminist school would have no right to consider her one of its apostles. She was simply an ambitious and wealthy bourgeoise, fond of society; and the best society she could have was the society of the Philosophers. She made them comfortable and they made her immortal. During the latter part of her life, her friends pressed her one day to write her memoirs, and, somewhat to their astonishment, she promised to do so. On a given evening all her friends were assembled and she began to read:

"Memoirs of Madame Geoffrin, in six volumes, duodecimo. Preface:

"The truthfulness of my character, the naturalness of my mind, the simplicity and variety of my tastes have rendered me happy in every situation in my life; I take pleasure in recalling its events, and a piquant pleasure in the idea that I am going to reveal myself to myself.

"This work will be for me what are generally, for us women, great projects of needlework or of tapestry: the choice of the design amuses us; the execution occupies us for a short time; we work little, we are soon bored, and we don't end the work."

And there, indeed, the memoirs terminated, nor was there any further question of them. We are, however, very well informed as to Mme. Geoffrin: her name is mentioned in the works of D'Alembert, Morellet, Thomas, Marmontel; her correspondence with the King of Poland, Stanislas August Poniatowski, was published by M. de Moüy; M. de Tornézy published a book on her, under the title, 'Un Bureau d'esprit au 18e siècle.' Goncourt, Sainte-Beuve, and others published valuable articles on the famous bourgeoise. M. Pierre de Ségur has used a precious collection of inedited documents. Mme. Geoffrin's only daughter, the Marchioness de la Ferté-Imbault, had no direct descendant, but among her heirs, in 1791, was Louis d'Étampes, Marquis of Mauny, the nephew of her husband; and she left him all her own papers as well as the papers of Mme. Geoffrin. M. Pierre de Ségur was allowed by the present head of the family to use the rich archives of the Étampes; he gives in an appendix the correspondence of the great Catherine with Mme. Geoffrin, and the letters written to her by Grimm from Saint Petersburg during her last malady. M. de Ségur has used also the letters of Mme. Geoffrin to Hume, which are preserved by the Royal Society of Edinburgh.

Mme. Geoffrin was baptized on June 2, 1699, in Paris. Her father, Pierre Rodet, had been a valet de chambre to the Dauphine, and had afterwards bought a small office depending upon the city of Paris. The mother of Mme. Geoffrin was his second wife; she was called Angélique Thérèse Chemineau. Mme. Rodet died after having given birth to two children, a girl and a boy; Rodet himself died in 1706, and the two orphans were educated by their grandmother, Mme. Chemineau, who seems to have been a person of much sense and activity. They lived near Saint-Roch. Diderot represents the child going to church in the early morning "in a flat cornette, a light *siamoise*, pretty as an angel, and joining, before the altar, the prettiest hands in the world." She was only fourteen when she was married to a man of forty-eight, who had fallen in love with her, M. Geoffrin, a modest, quiet man, who was manager and partner in the glass works of Saint-Gobain. Two years after her marriage, on April 20, 1715, Mme. Geoffrin had a daughter, and two years afterwards a son, who died at the age of ten.

The Geoffrins would probably have remained always very obscure if Mme. Geoffrin had not made the acquaintance of the Marquise de Tencin, who was living in her neighborhood, in the Rue Saint-Honoré. Mme. de Tencin had been first a nun at Grenoble; she left her convent and became one of the mistresses of the Regent. She afterwards had a son whom she abandoned, and who became known under the name of D'Alembert; after a life of great agitation, she had finished by opening a salon. How did this great *intrigante* become a friend of an honest and quiet bourgeoise like Mme. Geoffrin? Mme. de la Ferté-Imbault shall answer: "The Marquise de Tencin knew that my father was honest and rich, that my mother had much esprit, that I was their only daughter; she wished to become acquainted with my mother, so as to marry me to one of her protégés." It must be supposed, also, that the Geoffrins were proud to be admitted to the house of the Marquise. Mme. de Tencin was already old; her habitual guests were Fontenelle, Montesquieu, and other important people. Geoffrin had become very rich, and his wife began to give weekly dinners to her new acquaintances. This revolution was opposed to the simplicity of Geoffrin as well as his love of economy; but Mme. Geoffrin had her will, and her Wednesdays became an institution.

Geoffrin died on December 20, 1749, at the age of eighty-four. A few months after she had become a widow, one of her guests, who had been absent for some time, came to the hôtel in the Rue St.-Honoré. "What has become," he asked of the mistress of the house, "of the old gentleman who always sat at the end of the table, and who never said anything?" "He was my husband," she answered coldly; "he is dead." M. de Ségur repeats this anecdote, which has also been related by Sainte-Beuve, and which has, in fact, become legendary. I cannot help having some doubts about its veracity; but " se non è vero, è ben trovato." Madame de Tencin died soon after Geoffrin, and Madame de Geoffrin became, as it were, her heir, and continued to receive her customary guests; they came over to her salon; among the most noted of them were Mairan, Montesquieu, Fontenelle. She added afterwards to this pleiad Marivaux, Marmontel, D'Alembert.

"By a curious phenomenon," says M. de Ségur, "in this chosen assemblage in the midst of a world still new to her, Madame Geoffrin, this *parvenue* who, by her own confession, has received not even an elementary education, who has no tincture of letters, of arts, who has never learned anything excepting in a fugitive way, who does not even know how to spell, moves with perfect ease, is stranger to no subject, inferior to no tasks, provokes, animates, directs the conversation, checks it if necessary, enforces the proper moderation by a word, a gesture, an almost invisible thread. Nobody, it would seem, possessed in a higher degree the gift, peculiar to women, of assimilating naturally and without effort the things of the mind, in the measure in which they can be of use. 'I compare myself,' she said one day to Fontenelle, 'to a round little tree, which has branches on every side. I know a little of everything.'"

Voltaire showed himself several times in the salon of the Rue St.-Honoré, but he never became intimate with Mme. Geoffrin; they soon became hostile. When Voltaire had in his own house representations of "Rome Vaincue," she wrote to a friend, "Voltaire imitates the pastry-cook who eats the cakes which he cannot sell." He often made pleasantries in his letters on "the new Queen of Sheba."

Montesquieu, who was one of the oldest friends of Mme. Geoffrin, and who had learned to appreciate her at Mme. de Tencin's, was offended by a letter which she wrote to him after he had sent her his 'Esprit des Lois.' He imagined that she had written her letter without having taken the pains to read his work. Montesquieu wrote to Mme. de la Ferté-Imbault, who candidly confessed that her mother had made her read to her a few extracts only of the book, during about half an hour. She added that this method, "if it did not do honor to her mother's knowledge, did much honor to her natural esprit." Montesquieu, who was susceptible, and belonged to the "genus irritabile vatum," never forgot this incident.

The man who took and always held the most important place in the salon of Madame Geoffrin was Fontenelle. When she made his acquaintance, he was already seventy-five years old; he was a remnant of the past. He had seen Louis XIV. at the height of his power, having been born in 1657; he died at the age of one hundred, and age never seemed to affect his intellectual powers. "He knows only the mind," Madame Geoffrin said of him. He had an impeccable reason and all the qualities which are compatible with a perfect egotism. "Have you any esteem for me?" Madame Geoffrin one day asked him. "I find you very amiable." "But if somebody told you that I had killed one of my friends, would you believe it?" "I should wait," was the answer. He had the impassibility of a Talleyrand, with none of his vices. Somebody asked him one day: "Monsieur de Fontenelle, did you ever laugh?" "No, I never made ah! ah!" In her 'Nouveaux Mélanges' Madame Necker said of him that "he resembled a delicate machine, which would last for ever, if you put it in a corner, never polished it, or hurt it." Fontenelle's corners were the Academy of Sciences, of which he was Perpetual Secre-

tary, and the salon of Madame Geoffrin. He was a man of great knowledge. His 'Eloges,' his 'Entretiens sur la Pluralité des Mondes' can still be read with much pleasure and to great profit. He had a sort of quiet humor, which gave much piquancy to his air of perfect indifference. Madame Geoffrin once questioned him about his parents. "My father," said he, "was a fool; but my mother had wit. She was *quiétiste;* she was a sweet little woman, who often said to me, 'My son, you will be damned.' But it gave her no pain."

The Wednesdays of Madame Geoffrin soon became insufficient, and she had to take another day—Monday. She drew into her circle all foreigners of any eminence, and her house became cosmopolitan. She also introduced the fashion of asking artists, painters, musicians, sculptors, who had hitherto not mixed much with society people, and her house became in this way at the same time more aristocratic and more popular.

THE SCHOOLS OF ARCHÆOLOGY AT ATHENS.—II.

THE GERMAN ARCHÆOLOGICAL INSTITUTE AT ATHENS.*

Any account of the German Archæological Institute at Athens must be prefaced by a short history of the Institute at Rome and the *Centraldirektion* at Berlin—in other words, of the Institute as a whole; for only then can the motive, the functions, the aims, and the aspirations of so noble and useful a school be made abundantly plain to the American reader; only then can one fully understand what a power it is in all that concerns the advancement of the science of archæology.

The name *Institute* is calculated to mislead and confuse many who are not familiar with archæological matters, for the reason that it is officially applied not only to the directing head in Berlin, the Imperial German Archæological Institute, but also to its two fair children, the Archæological Institutes that are located, the one at Rome and the other at Athens. This confusion would have been avoided if the institutions in Rome and Athens had been called schools. As a matter of fact, in unofficial speech they are often, if not usually, called schools, not only by outsiders, but by those officially connected with them as well, and in like manner the term *Centraldirektion* is applied to the Institute in Berlin.

As I have shown already, the French led the way at Athens fifty years ago, and the grand success of France's School no doubt had much to do with the foundation of the German Institute at Athens just twenty-three years ago; but still too much stress must not be laid upon this thought, for, as a matter of fact, Germany, with her Winckelmann in sculpture, her Eckhel in numismatics, her Zoega, Welcker, Müller, Creuzer, Thiersch, Böttiger, Hirt, was clearly the pioneer not only in founding the science of archæology, but also in the establishment of an Archæological Institute, as will appear immediately. In the course of his scientific travels in Italy in the twenties, the gifted Eduard Gerhard, the semi-blind scholar and enthusiast for everything that appertained to classical antiquity, had been distressed to find that the monuments not only were widely scattered, but were also neglected, abused, and threatened with defacement, if not with actual ruin. It was then that his fertile brain conceived the idea of creating in Rome an Institute of Archæology, whose chief business it should be to study, draw, publish, and in so far preserve, at least to science, the monuments that were so precious for a knowledge of antiquity. Gerhard, with the intelligent and enthusiastic help of Panofka and the Duc de Luynes, developed and perfected the plan or constitution of the contemplated Institute, which was to be placed under the patronage of the Crown Prince of Prussia, Friedrich Wilhelm, who by good chance happened to be travelling in Italy in 1828. The distinguished Bunsen, by reason of his diplomatic position in Rome, and his scholarly enthusiasm, advanced the project materially; Fea and Borghesi gave their sympathy and active help, so that the birth of the Institute was watched over by men whose names sounded well in the earlier decades of this century—men, too, whose names are not forgotten by the generation of to-day. Besides these, a host of scholars from Germany, France, and Italy, along with a few from England, Denmark, and Greece, joined with the projectors in founding the Institute of Archæological Correspondence at Rome on April 21, 1829. The name given to the institution was justified by the fact that it was to be sustained and kept alive by an extensive correspondence on archæological matters, not only from Italy, but from scholars the world over who had anything of interest to communicate. It was therefore an international institution, conceived, indeed, by Germans, but at the start in no way connected with the Prussian or any other state; on the contrary, being wholly a private undertaking, it was dependent for its revenues upon the proceeds of its publications, though more especially upon the generosity of liberal-minded individuals, such as the Duc de Luynes in France. In the earlier years even Gerhard and Panofka often had to put their hands into their own pockets in order to preserve the Institute from a premature death.

In an institution so constituted, friction was to be expected; the Germans, French, and Italians were jealous each of the influence of the others; each nationality claimed precedence and sought to play the leading rôle. Not only that, but about the middle of the thirties a heated war was waged for the absolute possession and control of the Institute; the Germans wanted it removed to Berlin, the Frenchmen to Paris, but in 1836 Bunsen carried the day, and the Institute remained in Rome, fortunately for the larger interests of archæology. A compromise was made between the warring factions by which, thanks to the Duc de Luynes, the French element was allowed considerable independence of action. The quiet thus restored, with Braun as First Secretary (1838-1856), continued unbroken until 1848, the year of revolution, which marked the absolute withdrawal of the French from the struggling Institute in Rome. The reasons for this withdrawal were threefold: the political troubles which beclouded the atmosphere everywhere in Europe made Frenchmen more than usually languid in regard to matters of purely scientific interest; then the French School, which had been founded at Athens only two years before, had already begun to divert the French contingent to Athens; and lastly, owing to the continual bickerings between the national factions, the Duc de Luynes lost faith in the permanence of the institution and withdrew his effective support. This step left the Institute in the hands of the Germans and the Italians. But, in spite of adverse circumstances, much good had been accomplished during the first two decades of its existence, as may be inferred from the list of eminent scholars who had been in control of the fortunes of the institute: Bunsen, Gerhard, Panofka, Kellermann, Braun, Lepsius, Abeken, Henzen. In spite of the evident nationality of these men, the German language was forbidden in the meetings and in the publications of the Institute. At that time German was still the barbarous language of the North, whose use would have made the coöperation of other nationalities impossible. The papers intended for the publications were written in Italian, French, or Latin, while the language of the weekly meetings was chiefly Italian, though French and Latin might be used. The publications just referred to were three annual volumes: The *Bullettino* appeared monthly, and dealt especially with archæological news; the *Monumenti Inediti*, a folio volume, contained plates of important unpublished monuments; the *Annali* contained longer papers and discussions of the large plates printed in the *Monumenti*.

Financial troubles were always present, and when Braun died in 1856, these troubles threatened to wreck the Institute; but its life was secured by the devotion of Henzen, who remained bravely at the helm, until the addition of Brunn, as Second Secretary, started the Institute upon a new, and, as the event proved, more successful career. Friedrich Wilhelm had been the protector of the Institute from its inception, and had paid the meagre salaries of the secretaries from his privy purse; but Prussia had steadily refused to subsidize the Institute because it was a private undertaking. However, upon the Prince's accession to the throne, a small annual sum was granted to the Institute from the public revenues of Prussia, though as yet it was not recognized as a state institution.

The powerful and inspiring influence of the Institute had already begun to be felt in the universities of Germany, in all of which, thanks chiefly to the Institute, chairs of archæology had been established. In consequence of this fact, Wilhelm, the Prince Regent of Prusia, felt justified in increasing the annual grant to about $4,500 in addition to the petty salaries of the secretaries. At the same time two travelling scholarships, founded by private individuals, were thrown open to all German students, provided they had graduated in a Prussian university. And so, after thirty years of trial, the Institute ceased to be a private undertaking and became an institution of the Prussian State. The Centraldirektion in Berlin became directly responsible to the State, and the connection between the Centraldirektion and the Institute in Rome became closer. And yet it was not until 1867 that the Prussian State, at the instance both of the Centraldirektion and of the secretaries in Rome, began to think of assuming absolute control of the Institute. The reasons for this step are not

* In the preparation of this paper I have been aided most materially by the various writings of Michaelis: his 'Geschichte des Deutschen Archaeologischen Instituts'; his "Das Deutsche Archaeologische Institut" in *Im neuen Reich*, 1879; his "Das Deutsche Arch. Institut in Athen und die Ausgrabungen in Olympia," also in *Im neuen Reich*; his "Aufgaben und Ziele des K. Deutschen Arch. Instituts" in Vol. 63 of the *Preussische Jahrbücher*. The last article has been published in English in the *Journal of Hellenic Studies*, 1889, p. 190 ff.

far to seek: The Centraldirektion wanted state protection of property situated in a foreign country, and the secretaries, by becoming state functionaries, assured to themselves the comforting boon of a pension in their old age. It is interesting to know that this reorganization was finally effected amid the frenzied enthusiasm prevailing at the birth of the new German Empire, and that one of the first acts of Wilhelm as German Emperor was to sign the decree creating the *Prussian* Archæological Institute in Rome. The signing was done at Versailles on March 2, 1871.

This arrangement did not last long; events now began to march rapidly, for in 1874 the German Reichstag relieved Prussia of all concern in the matter of the Institute, made it national German, and the Imperial German Archæological Institute in Rome was an accomplished fact. At this time, too, the Institute was strengthened in other important ways—by the addition to the Centraldirektion of four archæologists in universities other than those of Prussia, by the creation of five travelling scholarships, each of $750 a year, and by increasing the annual grant to the imposing sum of $25,000 annually. But the year 1874 was otherwise memorable in the history of the science of archæology. As we have seen, that year chronicled the final reorganization of the French School at Athens; it also chronicled the inception of the epoch-making excavations at Olympia by the young and ambitious German Empire, thanks to the initiative of Ernst Curtius, and it chronicled the creation of the German Archæological Institute in Athens, thanks again to the initiative of Ernst Curtius. The German Institute, as a whole, became at once the centre of all archæological investigations. Like Athene herself, the Athenian Institute sprang into existence full armed and ready for the fray. Taught by the accumulated experience of half a century in Rome, as well as by the history of the French School at Athens, the Germans could set to work at Athens at once with the consciousness of strength, with well-defined aims, and without having to pass through the usual stage of transition or evolution from a condition more or less chaotic. In the earlier years of its existence the French School at Athens was exclusive, as was also the Greek Archæological Society, but the Germans, in founding the new Institute in Athens, desired that it should be a centre not merely for German, but for international archæological endeavor in Greece. Not that they had in mind to repeat in Athens their memorable experiences in Rome—the cases were different. Being unquestioned masters in their own house in Athens, they could afford to throw open its doors to all the world. The same liberality prevailed at the excavations of Olympia, for all of which the world has to thank the broad-minded Ernst Curtius. Thus by precept and example the German Institute has opened all doors in Athens, and has brought about an era of good-fellowship and of brotherly love in the bonds of archæology that does the soul good, so that, thanks firstly and chiefly to the German Institute, the life of the scholar visiting in Athens is one continued round of supremely blissful, because archæological, enjoyment.

The chief object of the German Institute is to study and publish the precious remains of art of all kinds, to investigate classical sites in the light of everything that appertains to their topography, their epigraphy, their history, and their existing monuments. Besides these functions the Institute organizes and conducts journeys with scientific objects in view, sends out expeditions of exploration throughout Grecian lands, makes excavations of important sites, and collects and publishes information in regard to all these matters. This does not exhaust its functions, for it must assist not only its *Stipendiaten*, or fellows, but all who travel in Greece for the sake of science, by its advice, its help, and the use of a rich library; it must institute regular meetings for the reading of papers on archæological topics of the day, and see to it that all natives and foreigners interested in the science of archæology are invited to attend.

When the German Institute at Athens was opened, the smoke of the Franco-German war had scarcely cleared away and French sympathizers were numerous in Athens. It was, therefore, a matter of great importance to secure as the head of the new Institute a man who in every way was able to cope with the difficulties of the situation and to unite all men in the furtherance of the interests of the Institute. Now, it is not generally known that, for many years prior to 1870, a trained archæologist had been attached to the Prussian Legation at Athens in the character of secretary. This attaché became a diplomatist, but he also gained familiarity with the people, with all matters of archæological interest in Athens and Greece, and with the ways and means of archæological research in the field and in the library. Now a young professor at the new University of Strassburg had previously been attached to the Prussian Legation at Athens for many years as archæological secretary. His name was Ulrich Koehler, and it was he who was chosen to be the first Director, or Secretary, of the Athenian Institute. He was a man of distinguished presence and tactful bearing, a polished gentleman, though for a German somewhat cold. A past master in epigraphy, in history, and in antiquities, he was, as it were, made for the place, the very man to give prestige and repute to the new Institute. With him, as Librarian, was associated Lolling, who knew Greece better than any other living man, and whose gentle, kindly nature was well calculated to make friends for the Institute.

The archæologists of the olden time were handicapped by the scrappy nature of the material with which they had to work. The publications of fifty years ago, despite their magnificence, presented mere fancy selections from a variety of well-known monuments of art with accompanying fancy letter-press sketches, or else they treated of the contents of isolated museums containing collections made by rich men, who were guided in their purchases solely by accident or the idiosyncrasies of individual taste, but not at all by sound scientific method. Among the earlier archæologists only Visconti, Zoega, and Welcker had so great a command of the whole field as to be able to write works that continue to command respect to-day, when men know that nothing but a thorough classification of all accessible monuments of art, entailing, of course, exhaustive treatises on each special branch of art, can lead to trustworthy scientific results, and so satisfy the universal craving for accurate knowledge. Gerhard, whose motto was, "He who has seen one monument of art, has seen none; he who has seen one thousand, has seen one," had early led the way with his 'Etruscan Mirrors,' and with his praiseworthy start in the field of vase-painting. He was followed along this line by Lenormant and De Witte in their 'Élite Céramographique,' though neither publication exhausted the marvellous stores, stores that have since then grown to colossal, even mythical, proportions. Clarac, too, was already on the ground with his 'Musée de Sculpture.' The giants of those days may have dreamed dreams of the future of archæology, but what joy would have been theirs had they lived to see the tremendous undertakings of the German Institute, undertakings that have been the direct results of their far-sighted teachings! What a mighty task was the 'Corpus Inscriptionum Latinarum' undertaken by Mommsen and Henzen, assisted by other scholars; how much was meant by that other Herculean labor, the 'Corpus Inscriptionum Atticarum,' by Kirchhoff, Koehler, and Dittenberger, both tasks having been undertaken by the Academy with the support of the Institute! Among other monumental works of the kind must be mentioned the 'Rilievi delle Urne Etrusche,' by Brunn, continued by Körte, who also continued Gerhard's 'Etruskische Spiegel.'

These and other vast publications which we cannot particularize here, do infinite honor to the Institute, but they do not seem to represent a methodical series of publications, because they owe their origin in the main to the initiative of individuals whose works the Institute was glad to publish, seeing that each of them formed links in the grand chain of publications contemplated by the Centraldirektion in Berlin. But, as time goes on, the method will appear, for the Institute proposes to present to the world exhaustive classified publications on statues, on pictures, on gems, on vase-paintings, on bronzes—in fact, on every conceivable class and category of ancient monuments. The preparation of each of these works requires toil on the part of a large number of men for years at a stretch, and in all this work the Institute at Athens bears its full share.

The Institute at Athens took rank at once with its elder sister at Rome, not merely because of the prominence of the men connected with it, but also because of the work which it began to do in furtherance of the plans of the Centraldirektion. Its individual periodical, the *Mittheilungen*, corresponded in the main with the *Annali* of the Roman Institute. Meantime the organ of the Centraldirektion in Berlin continued to be the *Archæologische Zeitung*, so that archæological periodicals were being published at three different centres, Berlin, Rome, and Athens, and all were official organs of the Institute as a whole, though each had its own individual task and was independent each of the other. Of course the sphere of action of the Athenian Institute is determined by its geographical position. In other words, it must ever be the headquarters for all explorations that are carried on in the Greece of antiquity, and in this sphere it exerts all its influence to the furtherance of the great tasks undertaken by the Centraldirektion. Both the secretaries and all the students, not merely the Fellows, but a well-equipped body of young men who spend their own money, work along the lines that will most effec-

tively promote the vast undertakings of the Institute, for the idealistic tone of mind which makes men pursue science for the love of it is not yet dead in the world.

Chiefly owing to the ever expanding purposes of the Institute as a whole, the old series of publications had to be abandoned, or rather merged into a new series. Other influences also combined to make such a change imperative: the Italians had begun to publish accounts of their excavations and discoveries in their *Notizie delle Scavi*, thus depriving the *Bulletino* of a great part of its material; then whereas, in former days, Rome was the centre of the art of engraving, the new processes of reproducing art monuments have robbed it of its sometime prominence, so that the removal of the folio publication from Rome to Berlin became a matter of necessity; lastly, when the *Monumenti* were published in Rome, too much importance and space were given to the reproduction of Italian monuments, to the great detriment of the monuments of the more important, because purer and more original, Greek art. Consequently a fundamental change in the publications of the Institute was made in 1886. The *Annali* and the *Archaeologische Zeitung* passed over into the *Archaeologisches Jahrbuch;* the *Monumenti* became the *Antike Bildwerke*, both being published in Berlin instead of in Rome. The *Bulletino* was merged into a new periodical which, in imitation of the *Athenische Mittheilungen*, was called the *Römische Mittheilungen*, although the memory of the old *Bulletino* has been preserved in the secondary title. In the Roman periodical both the Italian and the German languages are equally favored. The secretaries in Rome and Athens are wholly independent, both in regard to the editing of their periodicals and in regard to the sphere of their activity. The First Secretary in Athens gives lectures, represents the Institute, and conducts the finances. The lectures of Dörpfeld, the present First Secretary, on the topography of Athens, and his annual journeys to the Peloponnesus, the Islands, and Troy, are features of the archæological year, both because he speaks as a man having authority, and because they are truly international in character. The Second Secretary gives lectures, chiefly on art in the museums, edits the *Mittheilungen*, and has the oversight of the library.

The creation of the Institute at Athens was not accompanied by an increase in the number of stipendia or fellowships. The greatest freedom of action is given to the five Fellows: they may spend all or part of their time at Rome or Athens, or they may spend it in scientific journeys to any part of the world, say, to London or Egypt. If they are present in Rome or Athens, the only demand made upon them is that they take an active part in the fortnightly open meetings of the Institute. However, they are expected to pursue some special, self-chosen line of work, and if they have leisure moments they are required to assist the secretaries in observing new facts, and to seize every opportunity to help along the great undertaking of the Centraldirektion. It were well for men in our own School to take to heart and act upon the instructions given to the Fellows. The Fellow must spend the *entire* year on his *Studienreise*, and at its close he must send to the Centraldirektion an account of how it has been spent. The candidate for a fellowship must have passed either the Doctor's or the Staatsexamen, or both, and a period of three years must elapse between such examination and his proposed entrance upon the enjoyment of a fellowship. The Fellows live in the Institute building, in case non-Fellows (usually ten in number) are not already in possession of the five rooms. The Fellows are not required to take part in excavations, though occasionally they do.

Despite the youth of the German Institute, it can point to a galaxy of distinguished scholars who have been Fellows in Athens, such as Furtwängler, Purgold, Puchstein, Milchhöfer, Weil, Fabricius, Julius, Robert, Schreiber, Dressel, Von Duhn, Körte, Knapp, Von Rhoden, Löschke, Dessau, Schmidt, Wolters, Keck, Schäfer, Hülsen, Schwartz. The Institute is a power on earth for good, and still it is but entering upon its career.

J. R. S. Sterrett.

Correspondence.

A FLAGRANT INSTANCE.

To the Editor of The Nation.

Sir: Mr. Gerhard Gade, after having served as United States Consul at Christiania, Norway, for twenty-nine years, has had a successor appointed by President McKinley. Four years ago our Consulate at Christiania was threatened by a similar catastrophe, but the urgent and strenuous remonstrance that poured in from all sides proved effective enough to influence Mr. Josiah Quincy to send the new Consul to Gothenburg, instead of to Christiania. Consul Gade was appointed by his friend Gen. Grant, and, next to our Consul at Gibraltar, is the oldest in the service. Our present Government could not make a greater mistake, or an error more calumnious to Americans and American interests, than to appoint a successor to Consul Gade. Leaving out entirely all question of gratitude, recognition of long and faithful service—even of decency—there are many reasons why Mr. Gade is preëminently the man for his place. He belongs to one of the best of Norway's families, and lives on one of the few great estates left in the kingdom, where he offers lavish hospitality to every American. His late brother, Chamberlain Herman Gade, was one of King Oscar's dearest friends. Thus Consul Gade is, in an uncommon manner, able to represent, publicly and privately, America. Furthermore, he is a man who entertains and protects not only because of a sense of duty; with an old-school courtesy, a certain Sir Roger de Coverley quality about him, it has become second nature to him, a necessity. We have not many such representatives abroad, and those we have we can ill afford to lose. We truly must blush at the thought of a man of twenty-nine years of exemplary service, at the height of his vigor, being replaced by the "father-in-law of a Western campaigner."

In the recognition of merit we might, perhaps, be taught a lesson by Norway, whose King, in the twenty-fifth year of Consul Gade's consulship, thought that his services in American-Norwegian interests had been great enough to deserve the Cross of St. Olaf. His many years of office have been one long, continuous account of important services, of kindly interest in all travellers, and unflagging fulfilment of his duties. Many will hear with burning indignation the indignity done America in the appointment of a new Consul to Christiania, and hope that also this time the President will see his mistake before Consul Gade has been replaced.

C. B.

July 12, 1897.

THE TOBACCO PLANTER'S ESTATE.

To the Editor of The Nation:

Sir: Coming again, in the article on Washington's wife, in this week's *Nation*, to the usual statement concerning the impecuniosity of colonial Virginia tobacco planters, it occurred to me that I had a rather curious sequence of exceptions to this rule, if it be a rule, among my papers, and I herewith send either quotations or paraphrases of quotations from four wills made in succession by father, son, grandson, and great-grandson, which may interest your readers, both as bearing on the cash on hand in plantation life, and showing the method of portioning daughters in colonial times.

The first will, dated 1710, was made by a man born in the colony about sixty years before. His father's will probably was burned in the court-house of his county some years before the war, and I have no copy:

"Item, I give & bequeath unto my six daughters all moneys due to me in England, Virginia or elsewhere to be Equally divided among them deducting out of Each part what shall appear to be paid to Each of them by my book Ledger No. (4). Item, it is my will & I do order & appoint that in Case my mony will not amount to Seven hundred pounds to Each & Every of my daughters before named with what is all ready paid them that then & in such Case all crops of Tob° growing on the ground or in the houses at my death be sent to England in order to raise the aforesaid Sums of Seven hundred pounds to Each of my aforsd daughters. But in Case there Should be monys Enough to Comply with all debts & Legacys Exprest in this will that then & in Such Case the produce of the sd Tob° to goe to my three sons."

The three sons under the will took all the real estate. A codicil adds to the above £50 each to the youngest two daughters, and there were other small legacies aggregating a considerable sum.

In 1721 the eldest son of the maker of the last will, having three sons and one daughter, divided his estate between the sons, giving the daughter £1,000, and dealing further on with his cash in hand in a way to show the amount to be considerably above £3,000.

The third will, dated 1756, divides the landed estate between two sons, subject to the sale of specified tracts sufficient to provide £500 for each of six daughters, provided that at the time of marriage or coming of age of the eldest daughter the accumulated cash on hand be not sufficient to pay the £500 to each of the said daughters. As the chief of the tracts directed to be sold has always been and is now owned by his descendants, there is reason to suppose the cash was forthcoming.

In the fourth will in succession, dated 1814, for the first time daughters participated in the division of the real estate. There were seven sons and three daughters. The eldest five sons and the children of a deceased daughter had been portioned before the will was made. The two infant daughters received about one-half each of a son's por-

tion, which appeared, roughly speaking, to be eight hundred acres of land and thirty slaves to each one. After the portioning of all the children, the will directs the equal division among them of the residuary estate, real and personal, but charges the said residuary estate with the payment of £400 per annum, one-half in May and one-half in November, to "my beloved wife" during her lifetime. It is worth mentioning that the executors of the last will gave bond in the sum of $200,000.

If I were disposed to attach much greater value than I do to the above proof that rich planters were not unknown, I could not forget the existence of the other sort also, as long as I remember the pessimistic view taken by one good old relative of Gen. Washington, the strong lines of whose face used to get curiously tangled with the claws and horns of the lion and the unicorn on the mortuary tablet of Thomas Lord Fairfax over his head to my closing eyes as the preacher in his black gown droned away, from his high pulpit, and sleep overcame me on a hot Sunday in years gone by. Mr. Washington once said to another gentleman, where I heard it: "Yes, sir, I am a farmer; I raise corn, sir; and my hogs eat the corn, and my negroes eat the hogs, and I get what they leave." B.

MARYLAND, July 17, 1897.

Notes.

John Lane will shortly issue from the Bodley Head Col. John Hay's speech at the unveiling of Scott's bust in Westminster Abbey; 'The Stepmother,' from the modern Greek of Gregory Xenopoulos by Mrs. Edmonds; a parody, 'The Quest of the Gilt-Edged Girl,' by Richard De Lyrienne.

The Macmillan Co. announces 'The Household of the Lafayettes,' by Edith Sichel, and a 'Handbook of Metallurgy,' by Dr. C. Schnabel.

Prosper Mérimée's 'Letters to an Unknown,' translated by Henri Pène Du Bois, will be published immediately by Brentano's.

The celebration of Queen Victoria's Jubilee has tended to retard the publishing of books. Among these is the next volume of Mr. Rawson Gardiner's 'History of the Commonwealth,' and the same historian's answer to Father Gerard's brochure upon the Gunpowder Plot.

The increasing number of visitors to the West Indies from the United States, more especially in the winter time, will be glad to know that Sampson Low & Co. are about to bring out a new edition of 'The West Indies,' the very interesting hand-book, of which the author is Mr. Washington Eves, C. M. G. The new issue will have an entirely fresh set of illustrations, taken from photographs. Mr. Eves is a wealthy London merchant, who owns property in Jamaica, and dispenses a most generous hospitality to West Indians in general, when these visit England.

T. Fisher Unwin, London, has in hand a series of volumes under the general title of "Builders of Greater Britain." The editor is Mr. H. F. Wilson, M.A., barrister-at-law, and late fellow of Trinity College, Cambridge, who has, until recently, been private secretary to Mr. Chamberlain. Mr. Wilson, who has just been appointed legal adviser to the Colonial Office, designs that each biography shall give an adequate picture of the builder in relation to his work. The "Builders" will include those whose sphere of activity has been, in the main, administrative, as well as those who have fought and explored by sea and land. Mr. Wilson rightly believes that American readers will not resent the introduction of the names of William Penn and Lord Baltimore, the founders of Pennsylvania and Maryland. Each volume will contain the best portrait obtainable of its subject, and a map showing his special contribution to the imperial edifice. The following is a list of the first eight volumes, with the authors' names, that have been arranged for: Sir Walter Raleigh, by Martin A. S. Hume; Sir Thomas Maitland, by Walter Frewen Lord; John Cabot and His Sons, by C. Raymond Beazley; Lord Clive, by Sir A. J. Arbuthnot; Edward Gibbon Wakefield, by R. Garnett; Rajah Brooke, by Sir Spenser St. John; Admiral Philip, by Louis Becke and Walter Jeffery; Sir Stamford Raffles, by the editor.

It is now fourteen years since we noticed the first edition of the Messrs. Putnam's 'Authors and Publishers: A Manual of Suggestions for Beginners in Literature,' and said of it that it "ought to be in the hands of every one who purposes to make authorship either a vocation or an avocation." The public verdict has agreed with our own, and the author-publishers now put forth a very elegant seventh edition, considerably rewritten, but consisting in the main of the same subdivisions touching the relations of author and publisher, the method of securing copyright (with the text of the law), and the art of making books, from the preparation of the manuscript to the binding and illustrations. Mr. George Haven Putnam, whose share in this work is the larger, proposes a sort of court for the settlement of disputes between writer and publisher, which he hopes in time might give rise to a body of decisions that would satisfactorily fix the custom for both parties. There seems to us nothing chimerical about this, and it would at once test the reality of the proverbial grievances against publishers.

In connection with the foregoing we may mention a diverting lecture, "Autori e Editori," delivered before the Circolo Filologico of Florence by its President, Piero Barbèra, on March 29, 1897 (Florence: S. Landi). In Italy, it seems, the distinction between printers and publishers is not well understood by authors, who are as little aware of the fortunes of publishers' ventures. A publisher must be content, says Barbèra, speaking from experience, if five out of ten succeed badly or moderately, three or four well, and one extremely well, recouping the losses on the others. In Italy, too, domestic piracy flourishes in the book trade. The lecturer touched upon the evils of advance payments to authors; the choice between a lump sum and a royalty; the practice of taking a work in hand before it is finished and revised by the author; the "incorrigible correctors," like Alfieri and Foscolo and Balzac; the tricks of authors in selling the same work to different publishers, still known, as in the days of 'Le Diable Boiteux'; the want of intelligence in booksellers; the want of criticism in the reviews (as in Sarcey's in the *Revue Illustrée*); the compulsion of publishers to avoid certain lines (as the house of Barbèra novels), etc. The conclusion is that the good author makes the good publisher, as the good wife the good husband.

That "year-book of philanthropy," 'Burdett's Hospitals and Charities, 1897' (London: The Scientific Press; New York: Scribners), presents afresh in its eighth issue the rare spectacle of a combination of active discussion and criticism with scrupulously gathered statistics (these last being for the year ending December 31, 1895). The Queen's Jubilee and the charitable movement proceeding from it furnish the opening section of the new matter; and we remark as of interest coextensive with this survey of English, colonial, and American organized benevolence, chapter iii., descriptive and critical of hospital construction in 1896, and chapter xv., giving figures to show the working-class contributions to hospitals, etc.

Kürschner's 'Deutscher Litteratur-Kalender' for 1897 appears in its long-established form, preserving the plan of previous years, and being only a little larger than in 1896 (New York: Lemcke & Buechner). Two portraits serve as frontispieces: the first, of Dr. Max Ring, in honor of his eightieth birthday, the second of Detlev von Liliencron of Altona. The book is a mine of information about living authors, and is of the greatest value to all who desire to keep informed in regard to contemporary literary productions in German.

The Macmillan Co. publish 'Elementary Drawing,' a series of practical papers for beginners, written and illustrated by Elisabeth Moore Hallowell. The little book is not without merit, and the general system pursued is the right one, but it may be doubted if many of the matters treated of are not beyond the comprehension of such "beginners" as the work is intended for, even if they have thoroughly studied the earlier chapters. The attempt to teach "drawing without a master" is a doubtful one at best. There is at least one serious misstatement. Figure 2 on p. 17 is not necessarily false perspective at all, and is indeed exactly such perspective as is given as correct on pp. 10, 11, 12, and 14. It is the true drawing of an object on one side of a picture in parallel perspective, and can be considered false only if the single object is taken as the whole subject of the picture, in which case figure 3 becomes the proper perspective. The author's positive statement that such perspective is "manifestly impossible" must greatly shock and puzzle the poor student who has just been painfully learning that it is not only possible but obligatory.

For an illustration of the specialization of modern law, one may well turn to Mr. Gustavus Hay, jr.'s, four-hundred-page work on 'The Law of Railway Accidents in Massachusetts' (Boston: Little, Brown & Co.), which treats of the law of negligence as established in that State. Mr. Hay's system of digesting cases under each head of which he treats has been done before, but never better done for brevity and point. His most interesting chapter is on "reasonable conduct," in the course of which he urges with much justification that while a jury is perfectly competent to judge of "reasonable conduct" in cases of track-walking, or leaning from car windows, others quite different from ordinary questions of fact often arise, in which the norm of conduct cannot be cited, because none exists. In such cases, he says, the jury do not find facts, but legislate a new rule of conduct, often to the

railroad company's loss, and perhaps unjustly. For fairness' sake, he urges, the jury should contain at least one railroad man to present the railroad views, just as every peer was once entitled to the presence of one knight upon the jury to judge his matters. As Mr. Hay says, a military man has little patience with a tribunal of civilians, and a sailor, with a court of landsmen; but, interesting as his contention is, it will, we think, be more practicable and more salutary to keep the juries intelligent and honest.

One takes up 'Ruskin et la Religion de la Beauté,' by Robert de la Sizeranne (Paris: Hachette), with anticipations of amusement which are destined to disappointment. A French view of Ruskin should be interesting, but M. de la Sizeranne hardly gives it to us. He abstains from criticism and makes a loyal effort to explain what Ruskin is and what he says, leaving all comment to the reader, and betraying his own dissent only in the caution that it is not the truth, but the opinion of Ruskin, that he is endeavoring to state. To extract a consistent body of doctrine from the multifarious writings of that rhapsodist and poet who mistook himself for a critic, is perhaps beyond the wit of man, but M. de la Sizeranne has produced a picture with many hints of likeness. For the reader of English who has access to Ruskin himself and his more or less authorized interpreters, the present volume is superfluous; but it may well serve a purpose in France.

Admirers of Goethe will be glad to learn of Paul Heyse's poem 'Das Goethe-Haus in Weimar,' in which he gives expression to the reveries that come to his mind on a visit to the house so long occupied by the poet. He recalls the family group with the wife and children, revives the visits of Karl August, Schiller, Herder, Wieland, and numerous other personages who were frequent guests at the poet's home, goes through the various rooms, delighted with their simple yet wisely chosen furnishings, and enjoys the beauty and harmony of the whole place. The pretty booklet of twenty-four pages is illustrated with twenty-one portraits and views of rooms, the garden, works of art, and other articles contained in the house.

Gaedertz's 'Emanuel Geibel,' which has just been published as a memorial to William I., is an enlargement of the author's 'Geibel's Denkwürdigkeiten' of ten years ago. The new material comes largely from letters and poems put at the author's disposal after the death of Frederick William, from the collection of the Hohenzollern family, several members of which, especially the Emperor and Empress William I. and Emperor and Empress Frederick, were great admirers of Geibel. This fact, and the dedication of the book to the great Emperor, indicate tendencies that prevent it from being an impartial biography of the poet. The reader is constantly aware of the homage paid the imperial family, and this interferes with his getting a comprehensive view of the poet and his work in general. The author claims to have brought together the most important materials about the poet and to have produced a "Quellenbuch." Frequent quotations are made from correspondence, and many previously unpublished poems are presented with a statement of the circumstances that called them forth. Two good portraits, one in Geibel's early manhood and one for the year 1870, and several autographs adorn the book.

The indefatigable Professor Paul Fredericq has illustrated the religious history of the Netherlands with an exhaustive essay on the Dancing Mania which formed so strange an episode in the spiritual eccentricities of the fourteenth century. It is issued as an extract from the Transactions of the Royal Academy of Belgium with a very curious facsimile of a procession of Flagellants, from a contemporary MS. of the Chronicle of Gilles Li Muisis. Under his auspices, moreover, is issued a volume containing two essays on the sixteenth-century persecution of heresy—one by the late Jan-Joris Mulder, one of his most promising pupils, on the Inquisition in Antwerp from 1550 to 1566, the other on the Inquisition in Luxemburg by Dr. Julius Frederichs, whose previous labors in this department of history have made his name well known to all students of the subject.

The current number of the *Cosmopolitan* contains an interesting version of Omar's 'Rubáiyát,' in selected verses, by Richard Le Gallienne. The best stanza is perhaps the following:

"So since with all my passion and my skill
The world's mysterious meaning mocks me still,
Shall I not piously believe that I
Am kept in darkness by the heavenly will?"

The melody of this stanza is in marked contrast to the halting monosyllabic verses:

"Oh, come, my love, the spring is in the land!
Take wine and bread and book of verse in hand,
And sit with me and sing in the green shade."

The continuation of Le Gallienne's rendering will appear in the next number of the magazine.

A large part of the fifth number of *Petermann's Mitteilungen* is taken up with the Siberian railway and the related enterprises. Gen. Krahmer, in describing the results of the surveys (especially in eastern Siberia) made during 1895, evidently regards the upper Amur region as of little value for colonization. The winters are five and a half months long and the summers are very wet. Rain falls at times for a week without stopping, and in June and September fogs prevail. A cattle plague has also been disastrous, and the principal industry, gold-mining, has declined. Surveys for the line through Mantchuria, a thousand miles in length, are being vigorously pushed by Russian engineers under Government supervision, though it is nominally to be built by a private company. When the location is finally determined, a large force of laborers, who have just completed the Ussuri section of the Siberian railway, will be immediately set to work at either end. Chinese railways, which will connect with this line, are projected to Pekin and thence to Hankow, to Fusan in Korea, and to Port Arthur. Among the subsidiary works were explorations of the navigable parts of the rivers Yenisei and Obi, which are described by the commander of one of the expeditions. The solitude of these regions is strikingly shown by the fact that the party sailed up the Obi for seven hundred miles without seeing a human creature. On reaching the first habitations, the author says that "great as was the joy on the ships to see at length a shore on which men lived, just so great was the terror of the Ostiaks at the sight of the ships."

The annual report of the Berkshire Athenæum, Pittsfield, Mass., chronicles the completion of an important addition to the library building, giving it now a capacity of about 100,000 volumes, the number at present being 29,000. In order to bring the institution into closer contact with the city, there have been added to the Board of Trustees the Mayor, the chairman of the school committee, and the City Treasurer. The librarian, Mr. H. H. Ballard, contributes an account of the various methods of cataloguing, including the common card catalogue and the system employed by the British Museum. That which he has adopted for the additions seems to be a modification of the latter, and consists of "supplementary pages." He suggests that in time, by the aid of the linotype, "all the catalogues of the country shall be made and issued at a reasonable cost by some great central bureau."

Among the manuscripts acquired by the British Museum during the current year, the following may have some interest for historical students in America: 35073: Letters (58) of literary men of the nineteenth century; 35085: Latin Bible, vellum, thirteenth century, duodecimo, from the Cracherode collection; 35089: Vocabulary of the Aimará Indians in Bolivia, 1866; 35098: Original Entry Book of Sequestrations by Parliament, 1646-1649; 35102: Original Day-Book of Trustees for distributing forfeited lands in Ireland to the Army, 1656-1659; 35107: Original Minutes of the Privy Council, 1695-9, with other papers, 1662-1669; 35117: Original Entry Book of Crown Grants, 1661-1692. In the latter part of 1895, the Museum acquired a collection of manuscripts relating to the family of Waltthall of the County of Chester, of which a branch is settled in America, contenting itself, however, with but one *t* in the spelling of its patronymic. The papers cover the period from 1351 to 1886, and bear numbers from 34815 to 34818.

On Sunday, June 20, the most famous Danish scientist since H. C. Oersted, Johannes Japetus Smith Steenstrup, died in Copenhagen. Steenstrup was born in Vang, Jutland, Denmark, March 8, 1813. In 1841 he became Lector at Sorö Academy, and four years later he was appointed Professor of Zoölogy at the University of Copenhagen, a position that he continued to fill until his resignation in 1885. For more than twenty years of this time he was Secretary of the Society of Antiquaries, and on the death of Madvig in 1886 he refused the Presidency. He was also prominently connected with many other societies both Danish and foreign, making numerous contributions to their transactions. In proof of the estimation in which he was held abroad, it is sufficient to mention that he received the Prussian order *pour le mérite*, the only decoration that Carlyle condescended to accept. Although Steenstrup's *Hauptfach* was natural history, the direction of his studies brought him in close touch with archæology through his investigation of the Danish peat-bogs. To the insight of the scientist and the learning of the archæologist he added the imagination of the poet and the elegance of the accomplished stylist, making a combination of gifts such as has seldom been seen in the history of science and literature. Japetus Steenstrup is not to be confounded with his son Johannes, whose studies of the Danish settlements in England are of first importance.

—The most noteworthy piece in the July Publications of the Southern History Association (Washington) is the reprint of a paper on "John Brown's Raid" by Andrew

Hunter, the prosecuting attorney. We are told that it was first published in a newspaper in 1887, having been written "a few years after the execution of John Brown." The narrative creates a favorable impression of the writer, but it is quite obsolete in its estimate of the magnitude of Brown's force or of the complicity of the North at large in his enterprise. In fact, its greatest value is in its unconscious portraiture of Southern society at the time. When Gov. Wise proposed that the Harper's Ferry prisoners be sent to Charlestown that same evening, Hunter "saw this would not do." The Governor replied: "You have Captain Rowan's company to protect them [from the mob] from the depot to the jail?" "Oh, yes, we have," answered Mr. Hunter, "but that company will massacre every one of them before they reach the jail. My advice is, therefore, don't send the prisoners up to-night, unless you go with them with a party of Col. Lee's marines"—which happened accordingly. Mr. Hunter says, no doubt truthfully, that the story of Brown's kissing a negro child as he left the jail on his way to execution (surrounded by soldiers) is pure fiction; but he answers for the truthfulness of this incident: "While the body was hanging, Strother [*Harper's Weekly's* artist, "Porte-Crayon"] slipped up, raised the cap from the face, and took a sketch of him hanging. He said that the celebrated Lydia Maria Childs [*sic*] had published that she wanted to have a portrait or likeness of Brown in every condition of life to hang in her room, and that he had taken this sketch to send her that 'she might have him too when he was finished.' " Mr. Hunter's amusing proofs of Virginia's panic, in his endeavor to establish the multitude and nearness of Brown's myrmidons, do something to offset the grewsomeness of such a performance as this of Strother's. "John Brown's carpet-bag," presumably hidden in the Capitol at Richmond, but sought for in vain, is about all that is left to throw light on the raid.

—The Royal Geographical Society held its last sessional meeting for the year on the 17th of June, in the theatre of the School of Mines, London. A paper was read on this occasion by Prof. York Powell, who succeeded the late Mr. Froude as Regius Professor of Modern History at Oxford, in which the lecturer advocated the establishment of an English School of Charters, similar to the École des Chartes at Paris under the direction of the French Government. The paper itself will be found in the printed Proceedings of the Society. At present almost the only provision for teaching the branch of historical science for which Prof. Powell advocates support by the State, is at the universities. Messrs. Poole, Madan, and York Powell lecture upon Palæography and Diplomatics at Oxford; and Mr. Hubert Hall, one of the experts of the Public Record Office, is to treat upon the same subjects at Cambridge next term. Lastly, there is the London School of Economics, at 10 Adelphi Terrace. Referring to the discussion upon Prof. York Powell's paper, a contributor to the *Nation* writes from London:

"It is quite amusing to hear men of science pitching into the Government for not voting money for the endowment of scientific research and instruction. How they snort and sneer at the Chancellor of the Exchequer for keeping a tight hold upon the public purse-strings. Of course they are quite right in the opinion they hold as to the value of such studies. They do not, however, realize that they must first teach the public the utilitarian nature of their work. A Chancellor of the Exchequer will always find money where the representatives of the people are ready to vote it. In the case of the Nelson dispatches and relics, offered for sale by Lord Bridport, in 1895, both Sir William Harcourt and Sir Michael Hicks-Beach readily acquiesced in the purchase of those memorials of England's naval hero, when the matter was proposed to them by Sir Edward Maunde Thompson, the principal Librarian of the British Museum. The fact is the British taxpayer knows something about Nelson, and takes a very lively interest in the navy, but the voter's interest in ancient writings is not greater than his knowledge of their value to students of history."

—The Society of Friends of Russian Freedom have just issued in their Pamphlet No. ix. an account of the Russian Nonconformists and the treatment meted out to them by the Russian Government, which contains a well-informed summary of sectarianism in Russia. After some discussion of the officially published statistics of religion in Russia, the importance of separating the *Raskolniki*, or "Old Believers," not only from the "Sectarians," but also from the "Orthodox," is insisted upon. The official estimate of the Sectarians of South Russia at two and a half millions is pronounced an understatement. They really number more than four millions. The suppression in official returns of the Lithuanian sect of the "Uniats" is also an error, based upon the recent and over-sanguine declaration that this sect has been converted to Orthodoxy. For these and other reasons it is maintained that, as a matter of fact, the proportion of Sectarians (including in these the Old Believers as certainly not Orthodox) to Orthodox believers in Russia is something like one to six. So far from true is the prevalent impression that the population of the Russian Empire consists of one homogeneous Orthodox mass. The pamphlet further gives a brief sketch of the origin of the *Raskolniki*, who were originally dissenters from the "innovations" of the patriarch Nikon, promulgated in the second half of the seventeenth century. Under Nicon and the Tsar Alexis, they were outlawed. Catherine II. gave them a certain toleration, and in 1822 Alexander I. gave them religious liberty. Nicholas I. reversed this policy. At present they have full legal recognition, and churches in both capitals as well as elsewhere. They have in recent years tended to take the attitude of Sectarians pure and simple, an attitude more or less forced upon them. As to the rise of Russian sects, specifically so called, this goes back to the foreign immigration first encouraged on a large scale by Peter the Great, and more especially to the German Colonies fostered by Catharine II. From among the indigenous "Old Believers" there came, under these new influences, many sects half mystical and half rationalistic, the Dukhobortzi for instance, and the Molokani. The former have rallied around a sort of Quakerism, introduced early in this century, while the Molokani bind themselves to avoid slavery, war, military service, and the taking of oaths. More active of late years has been the spread of Stundism, and the rise of a group of sects more or less "evangelical," which apparently owe something of their hold upon the people to governmental activity in the suppression of dissent; the lamentable inefficiency of the Russian Orthodox clergy has done the rest. Accordingly, it is believed that there are now a quarter of a million of Stundists in Russia.

—Dr. Fritz Hommel, professor of Semitic languages at the University of Munich, has just published a volume entitled 'Die Altisraelitische Uberlieferung in inschriftlicher Beleuchtung,' in which he enters a strong protest against the modern school of Old Testament criticism. A little more than twenty years ago Eberhard Nestle published at Haarlem a work on 'Die israelitischen Eigennamen nach ihrer religions-geschichtlichen Bedeutung,' in which he attempted to analyze the proper names found in the Old Testament and to use them as a means of testing the authenticity of Hebrew tradition. These conclusions were vigorously assailed two years later by Julius Wellhausen in the first volume of his 'Geschichte Israels,' where he endeavored to show that the proper names in the priestly code ascribed to the Mosaic period were, like the code itself, the fabrications of a much later time, and that the inferences drawn from them by Nestle were therefore invalid. In the present volume Prof. Hommel follows out the lines of investigation indicated and partly opened up by Nestle, and brings to bear upon the subject a vast amount, not only of accurate learning, but also of new and valuable material derived from South Arabian inscriptions, for which he is indebted especially to the recent scholarly explorations of Dr. E. Glaser, who unfortunately has published as yet only a small portion of the hundreds of casts and copies in his possession. Hommel's treatment of personal names and their etymological significance is exceedingly acute and exhaustive, and his work is certainly one of the most learned and valuable of recent contributions to primitive Biblical history. Whether his deductions in confirmation of the truth and trustworthiness of Hebrew tradition touching pre-Mosaic times, the prevalence of monotheism and a high state of civilization among the Israelites at that early era, the reality of Abraham as an historical personage, and not a merely tribal designation, the predominating influence of Babylonian in distinction from Canaanite culture, and other kindred topics, will be generally accepted by Biblical critics and the younger generation of theologians, remains to be seen. The English translation published by the Society for Promoting Christian Knowledge in London reads well, and is generally correct, but not always.

—Mr. H. C. Russell, F.R.S., Government Astronomer at New South Wales, has recently issued a group of valuable papers upon interesting points connected with his work in that remote country, not one-seventh of the whole Australian continent. The extremes of its climate he compares with Sicily and Edinburgh—the temperature of the latter prevails at its coldest mountain town, Kiandra, 4,600 feet elevation. The general features of the country are comprised in three divisions. A long strip of coast district contains fifteen large and navigable rivers; back of this fertile and well-watered region, with its abundant rainfall, comes a range of high lands along the mountains, also with plenty of rain, and well adapted for agricultural purposes; and in the west the great plains, with a number of small rivers. A large capital has been expended here in making tanks and artesian wells, though even now the country is hardly

adapted for raising fruit or cereals. Mr. Russell believes in a certain periodicity of the weather; and in a paper read before the Royal Society of New South Wales, he sets forth his theory that the seasons may be forecast years in advance. Floods and droughts are carefully studied from early records, and generalizations deduced from them. A drought in New South Wales is not merely a few weeks without rain, as in England or America, but occasional periods of months or years when, from the diminished rainfall, the country is almost literally burned up, no crops can be raised, and cattle die in large numbers. In countries having a superabundance of rain, even a considerable diminution is hardly noticeable, while in another place, having just enough in the best times, a slight withdrawal makes serious drought. The same causes operate in both cases—great heat and drying winds. From his diagram upon which all droughts in all countries without regard to their intensity were placed in order of time since 1788, Mr. Russell sees marked evidence of a nineteen-year cycle. Going backward still further he finds noticeable verification. The nineteen-year cycle would seem to have been in marked progress not less than a thousand years, and may, Mr. Russell assumes, be trusted to continue and justify forecasts based upon it for a long time to come. A paper upon the ocean currents around Australia is compiled from seventy-six records which had been put into bottles and cast into the sea at various points, and Mr. Russell has charted not the supposed track taken by the bottle, but the shortest line between the points of throwing overboard and of finding. The mean rates of motion over the same ocean are, however, singularly alike. In the case of three bottles set afloat off Cape Horn they seem to have followed nearly the same tracks, and to have travelled 9.0, 7.9, and 10.3 miles daily, over distances of 9,517, 8,617, and 9,585 miles. One bottle going southward made nearly eighteen miles a day. More of these "current papers" are found on the coast between Melbourne and Adelaide than in any other part of Australia.

KNIGHT'S WORDSWORTH.

The Poetical Works of William Wordsworth. Edited by William Knight. 8 vols. Macmillan.

The Prose Works of William Wordsworth. Edited by William Knight. 2 vols. Macmillan.

When it was announced, some time ago, that Prof. Knight was about to reëdit Wordsworth, the news was received by literary students with what Dr. Johnson might have called feelings of expectancy mingled with trepidation. Prof. Knight was known as an enthusiastic and untiring Wordsworthian, possessed of a singular faculty for collecting materials and getting at inaccessible things. He had also commanded, for years, the good offices of many close students of Wordsworth, some of them men of learning and acuteness. On the other hand, his former edition (Edinburgh, 1882-86) had not given an altogether favorable impression of his accuracy or his good judgment. The beautiful volumes of this older issue were in every library, and, despite their inconvenient size, in every hand; but, the more they were used, the clearer it became that they needed thorough revision, and the stronger grew the doubt whether Prof. Knight could ever fit his habit of mind to the requirements of editorial exactness. Ten volumes of the new edition, out of a promised sixteen, have now appeared, and one can arrive at a tolerably correct estimate of the merits of the performance.

Volumes i.-viii. contain the Poetical Works, and have, accordingly, a special title-page. The Prose Works come next, in two volumes. Vols. xi.-xvi. will contain Dorothy Wordsworth's journals, the letters of William and Dorothy Wordsworth, a large amount of bibliographical matter (including an entirely new "Bibliography of Wordsworth Criticism"), and a Life. The Life, we are assured, will be considerably shorter than that published in 1889, for the letters and journals will not have to be included in it. The Correspondence will afford much unpublished matter. Prof. Knight mentions, in particular, the poet's own letters to Wrangham, and more than a hundred letters from Dorothy Wordsworth to Mrs. Clarkson. All this will be worth having, and insures for the new enterprise a respectable position among the books of the century, whatever may be thought of its claims to definitiveness. The two volumes of the Prose Works call for no comment. We shall, therefore, confine ourselves in this notice to the Poetical Works.

Two fundamental questions confronted the editor at the outset: the formation or selection of a text, and the settlement of the order in which the poems should be printed. Both problems are discussed at some length in the preface. For the former, Prof. Knight has certainly reached a correct solution. Wordsworth was continually revising his poetry, often for the better, but not seldom decidedly for the worse. An eclectic text like that formed by Matthew Arnold in his well-known volume of 'Selections,' would very properly be resented as an impertinence in a complete edition. To take one text for one poem, another for another, was equally out of the question. Accordingly, Prof. Knight has decided to accept the form which Wordsworth himself finally adopted—that is to say, the text of 1849-50—but to register, in footnotes, all the variations, except those of spelling and punctuation, shown by the editions published in the poet's lifetime, or discovered in manuscript. No conceivable objection can be urged against this method, and its advantages are manifest, not the least of them being the opportunity it affords to students of literature to observe the motions of the artist's mind and the artist's hand. Every imaginable kind of shift is represented in these textual notes. The general is substituted for the particular, the particular for the general; homely expressions make way for more elegant ones, conventional elegances are replaced by vigorous bits of homeliness; amplification and retrenchment are alike conspicuous. Particularly interesting are the many instances in which a word or phrase once rejected finds its way back into a verse, only to be expunged again, perhaps, in the process of incessant revision.

The second problem, that of the order of the poems, is less satisfactorily solved. Wordsworth's own careful and instructive grouping into "Poems of the Imagination," "Poems of the Fancy," etc., is abandoned, and a chronological arrangement is carried through. To the justifying of this procedure Prof. Knight devotes much space in an argument which, we fear, must be rated among "too curious and striving apologies." His main argument is, of course, that his plan affords special opportunities for studying the development of the poet's mind and art. He does not convince us, however, that a chronological table, like Prof. Dowden's, would not, in this respect, have answered every purpose. We cannot help thinking that no editor has a right to disregard his author's wishes in so deliberate and far-reaching a fashion. From Wordsworth's point of view, an arrangement by dates is, as he once said with much emphasis, "the worst possible," and, however instructive Prof. Knight may find his own new order, most readers will prefer that to which the poet himself gave so much time and pains, and which is in some respects a very significant expression of his critical theories. We need not go into the question at large, for, in the present instance, Prof. Knight's method is condemned by its results. Poems which belong together by every principle of sentiment and association are ruthlessly torn asunder, and yet, after all, consistency is not attained. Especially curious is the treatment of "The White Doe of Rylstone." This is referred to 1808, "although part of it —probably the larger half—was written during the autumn of the previous year, and it remained unfinished in 1810." Consequently, it appears in Prof. Knight's fourth volume. The Dedication, however, was not written until 1815. In this case even Prof. Knight has not sufficient resolution to separate the two, and he has, therefore, printed the dedication along with the poem. When he arrives at the year 1815, however, in the sixth volume, he repeats the Dedication, "from a MS. copy which differs considerably from the final text, and was probably the first draft." Anything more vexatious than the to-and-fro motion thus forced upon the reader it would be hard for the most perverse of editors to contrive. We may mention by the way that Prof. Knight says nothing of the whereabouts of this MS. copy, ignoring the first duty of an editor—the obligation to define the sources of his text. It is his habit, indeed, to insert variants marked simply "MS.," with no hint as to what manuscript is meant. A recent publication has shown that he derived much of this material from the Longman papers, and has incidentally discredited his accuracy as a copyist.

We could wish this were the only editorial obligation which Prof. Knight had neglected or but slightingly performed. Unhappily, the omission just remarked is but too characteristic of his methods. The textual notes, to be sure, are much better than those in his former edition, and, though they do not always bear close scrutiny, may be accepted as substantially accurate. Still, in one vexatious instance, they show in a conspicuous way the carelessness, or, at all events, the vacillation, which pervades the work. In printing "Simon Lee" it was clearly Prof. Knight's intention to register variants fully in the footnotes, as usual, and there is, accordingly, no hint in the body of the volume that this has not been done. In an Appendix, however, which, characteristically, is furnished with no backward reference to the page where the poem is printed, we read that "it was found impossible to describe, within the limits of a footnote, the endless shiftings to and fro of the stanzas and half stanzas," and accordingly we have an addi-

tional two pages and a half of textual apparatus. If this appendix formed a part of the editor's first plan (which we very much doubt), the introduction to the poem, or the first textual note, should have apprised the reader of its existence and whereabouts,

If we pass from the textual to the explanatory and illustrative notes, we find a prevailing unsteadiness of purpose and of performance. Take, for example, the matter of imitations and parallel passages. It is no doubt difficult to maintain any consistent principle in calling attention to such things. But Prof. Knight does not seem to have striven to maintain any principle; rather, he has jotted down, somewhat idly, a few passages in other authors that occurred to him or were sent to him by correspondents. Sometimes the parallel is slender enough. It requires a microscopic eye to detect, as Canon Ainger and Prof. Knight have done, a reminiscence of Lady Winchelsea's vivid if ill-finished lines,

> "Whose stealing pace and lengthened shade we feel,
> Till torn-up forage in his teeth we hear,"

in Wordsworth's prosaic and ineffective

> "The horse alone seen dimly as I pass
> Is cropping audibly his later meal."

Why, too, should it be thought necessary to quote "L'Allegro" when Wordsworth merely mentions Euphrosyne (vol. vii., p. 185)? There is no real allusion to Milton in the passage thus annotated. Quite malapropos is the quotation from "Henry V." made to illustrate a passage in the ode "Imagination—ne'er before content." Wordsworth, apostrophizing the God of Battles, has in his mind a thought very different from that of Shakspere's king. He is contemplating the great purposes of God as worked out by the hand of man in warfare; in "Henry V." it is the punishment of the individual offender that is in question. Other examples of this kind of annotation might be cited. On the other hand, clear cases of imitation or allusion are not seldom overlooked. In general, we cannot discern that any principle of choice has been observed, or even conceived, with respect to the citation of parallels.

A rather large number of Prof. Knight's notes are of what used to be called the "school-boy" sort. In particular, he has thought it right to explain many classical allusions of a distinctly every-day character. "Leonidas, king of Sparta, killed in the heroic defence of the pass of Thermopylæ, B. C. 480"; "The Nine Muses, called the Pierides, from Pieria, near Olympus, where they were said to have been born, or first worshipped by the Thracians"; "Numa Pompilius, the second king of Rome" (there follows a quotation from Niebuhr); "The statue of Amenophis in the vicinity of Thebes—called by the Greeks the statue of Memnon—was fabled to give forth a musical strain when touched by the first ray of sunshine"; "The Hamadryads were supposed not only to haunt the trees, but to live in them, and to die with them"—one is at a loss to decide for whom remarks of this nature are intended. In a school-book of a very elementary kind they might possibly be in place, but in a dignified library edition of an English classic—! Yet, even in this point, Prof. Knight has not managed to be steady in his commenting. "Bold Bellerophon" falling "headlong from the fields of air" is left noteless by a scholiast who thinks it his duty to explain "the bright immortal Theban band" and to tell his readers that Alcæus wrote odes, and that "the Julian spear the way first opened" refers to "the conquest of Britain by Julius Cæsar." Besides being elementary, some of these classical notes are vague and feeble. Thus,

> "Fabled Cytherea's zone,
> Glittering before the Thunderer's sight,"

if it calls for any comment, calls for a reference to the fourteenth book of the 'Iliad,' instead of which we find the following obscure and ineffectual remark: "It was near the island of Cythera that Aphrodite was said, according to some legends, to have risen from the sea foam. Hence the term 'Cytherea's zone.' The 'Thunderer' is, of course, Jupiter Tonans." To tell the truth, one cannot help suspecting that Prof. Knight is not very ready with his Greek and Latin authors; for, apart from such commonplaces as Leonidas and Jupiter Tonans, he appears to have depended almost entirely on friends and correspondents for his knowledge of Wordsworth's classical allusions. Even for such obvious learning as is required to explain "Laodamia" and to compare "Dion" with Plutarch, the editor relies upon another, and the scrap-book appearance of the annotation is in some measure due to the necessity he is under of crediting to various persons information that ought to have been within his own reach.

In fact, the more Prof. Knight's notes are examined, the more slovenly they seem. Nothing surely can be more familiar than the story of "King Lear"; yet, when Wordsworth, in eight lines of "Artegal and Elidure," summarizes it (from Shakspere and not from Geoffrey of Monmouth), Prof. Knight seizes the opportunity to insert an extract from Milton's 'History of England' which occupies a whole page of the very finest type. This is mere padding, nor can a more respectful term be applied to much of the five pages of anecdotical matter appended to "The Brownies' Cell." No blame attaches to Mr. Malcolm M'Farlane, patronizingly described as "a very intelligent sheep-farmer in Buchanan parish," for furnishing Prof. Knight with some irrelevant reminiscences of a whiskey-drinking congregation in Scotland. It was Mr. M'Farlane's plain duty to write freely, and he is doubtless as much surprised as we are to find the importance attached to this part of his communications. The letter from Prof. Sellar (vi., 206) need not be called padding, for it helps to fill a page that would otherwise be mostly white paper. Yet we venture to think that Prof. Sellar did not intend it for formal publication.

On the "Fish-women" sonnet we observe a note that is downright amazing. "The name Amphitrite," runs this curious bit of sciolism, "is probably derived from the noise of waters pouring through the rifts of rocks, and there may be an allusion to this in the concluding lines of the sonnet." One might excuse the obsoleteness of this comment, but it is not easy to pardon its frigidity. To explain

> "Their voices into liquid music swell,
> Thrilling each pearly cleft and sparry grot,
> The undisturbed abodes where sea-nymphs dwell"

as an etymological allusion is certainly an exploit.

Almost as good is the remark, "Here the reference may be to Cædmon's *Paraphrase*," attached to the well-known stanza in which Wordsworth refers to the hymns of the Druids:

> "Not such the initiatory strains
> Committed to the silent plains
> In Britain's earliest dawn:
> Trembled the groves, the stars grew pale,
> While all too daringly the veil
> Of nature was withdrawn!"

If Prof. Knight would refresh his memory by reading a few pages of what he calls "Cædmon's Paraphrase," he would at once admit that it contains nothing to make the stars grow pale or the groves tremble. As to its having been "committed to the silent plains in Britain's earliest dawn," the less said about that the better.

Another instance of lack of penetration is the note on the sonnet entitled "Captivity." "Why this sonnet was printed from 1819 to the last edition of 1849 with inverted commas," says Professor Knight solemnly, "I have never been able to discover." Surely there is no great mystery here. Wordsworth is not speaking in the first person in this poem: it is an ejaculation of Mary, Queen of Scots, from beginning to end. This is the plain reason for the quotation marks, which, we suspect, have never perplexed anybody before.

A few miscellaneous flaws may here be collected. The note on Mithridates and Odin (iii. 137) is vague and feeble: one is left in doubt whether Professor Knight regards the Scandinavian god as an historical character or not. Yet there is nothing really obscure in Wordsworth's allusion. In striking contrast with the editor's indecision on this point is his dogmatic dictum about Stonehenge, which is, we are informed, "a Saxon ring, set up—after the Romans had left Britain—for parliamentary and coronation purposes" (v. 112). To ascribe to Spenser the epitaph on Sidney quoted at i. 267 is a serious error. For Taliesin the reader is referred to nothing better than "Pitseus" and Sharon Turner (vii. 13). What German scholar is meant by "Welcher" (vi. 204) it is not hard to guess, but the misprint is amusing. "De rerum naturæ" (vii. 328) is another ugly slip of the types. At ii. 204, one expects some information about "the German of Frederica Brun"; what is offered instead is an ill-expressed and indeed scarcely grammatical note, with regard to the Scottish ballad "Binnorie," with a misprint in the title given to it by Scott—a note hardly intelligible and thoroughly misleading. At i. 77, "published" should of course be "published in part." At ii. 243, Chaucer's little schoolboy is made to sit *in*, instead of *at*, his primer. Useless repetition is not lacking. Thus, in volume vi. we are thrice informed, in the compass of two pages, that a certain sonnet was published January 28, 1816. Lack of exact references may almost be called a characteristic trait of Prof. Knight's notes. Wordsworth refers to "Tasso" for the phrase *dolcemente feroce*, and Prof. Knight contents himself with a like indefiniteness. Nobody expects chapter and verse from poets, but editors exist for the express purpose of giving them. Other examples of this carelessness are iii. 40, vi. 186, vii. 17, 305, where 'Sartor Resartus,' Gray's 'Journal,' Bede's 'Ecclesiastical History,' and Burn's 'History of Westmorland and Cumberland' are quoted or cited by title merely, with no hint of chapter or volume or page or edition.

It is not to be inferred from all this that Professor Knight's notes are valueless or that all of them are slovenly. As a whole,

those that concern themselves with literary or historical comment and illustration or with exegesis are disappointing, either for what they contain or for what they omit, or from their form. But in three particulars Prof. Knight has done excellent service to literary history. He has collected every scrap of evidence which can help to determine the dates of the several poems and the circumstances under which they were written; he has explained all personal and autobiographical allusions; and he has given much time and pains to Wordsworth's topography. In the last-mentioned particular, the interest of which need not here be insisted on, he has had enthusiastic and intelligent collaboration. The Duddon Sonnets, for example, are accompanied by an elaborate commentary of this kind prepared by Mr. Herbert Rix, and have, also, some brief notes by Canon Rawnsley, whose books on the Lake Country are widely and favorably known. Some readers may think the topography over-minutely studied, but we cannot agree with them. The apparent excess is due to the fact not that too much attention has been paid to topography, but that too little has been paid to some other matters, particularly those of a literary kind.

In closing we wish to provide against a possible misconception. Prof. Knight has, in our opinion, done a great service to literature in his new Wordsworth, and his volumes will long rank as a standard library edition of the poet. Such a work, however, demands a high standard of editorial accuracy and elegance, and to this standard the volumes before us do not conform. Though well qualified to be the general manager of such an undertaking, Prof. Knight should not have tried to work without a colleague, but should have selected some associate who could supply his own serious defects in learning, accuracy, and neatness of literary workmanship.

The Sense of Beauty; Being the Outlines of Æsthetic Theory. By George Santayana. Charles Scribner's Sons. 1896.

This book is the best possible complement to Mr. H. R. Marshall's work on Æsthetics. Marshall's theories concern themselves with the elementary conditions that make experiences agreeable or disagreeable. Dr. Santayana has but little to say of these conditions; he takes differences of pleasantness for granted, and traces those further conditions that prompt us to regard the pleasantness rather as a quality of the object than as an affection of the self—such "objectivation of our pleasure" being for him the best definition of the "beauty" of the experience. Between them these two authors place our country well in the van of the literature of this fascinating, though profoundly unsatisfying, topic of speculation.

The great merit of both works is the concreteness and reality with which their authors grasp the subject. An artist reading them will not find the deepest instincts of his Being violated as it is by so much of the grotesque stuff called Æsthetics in the systems of German philosophers, from Baumgarten and Kant downwards. These American writers, he will say, have been there, and know how I and those like me feel about our work. The stainless exclusiveness and absolute supremacy of an abstraction called Beauty, with a big B, play no part in their pages, and the vast and shifting play of Man's æsthetic life has consequently a chance of coming to its rights. Dr. Santayana's pages are indeed saturated with so catholic a sensibility for the most diverse sources of æsthetic value that one is almost surprised to find him standing up as firmly as he does in many places for classic determinism of form (which usually is what the Beauty with a big B means) as against that richness in vague suggestion that characterizes romantic work. This just balance in a strongly sympathetic æsthetic nature is what gives to his various critical judgments such luminousness and weight.

After fifty pages on the nature of beauty, in which he takes an ultra empiricist position, Dr. Santayana discusses (in three separate sections) the sensible material, the form of combination, and the expression or remote suggestiveness of things, as being respectively the sources of our pleasure in them. Form is more essential than suggestiveness, matter more essential than form. Here is a passage in which he defends the claims of pure sensation:

"There is no effect of form which an effect of material could not enhance, and this effect of material, underlying that of form, raises the latter to the higher power, and gives to the beauty of the object a certain poignancy, thoroughness, and infinity which it otherwise would have lacked. . . . Taste, when it is spontaneous, always begins with the senses. . . . The simplest people appreciate the neatness of muslin curtains, shining varnish, and burnished pots. A rustic garden is a shallow patchwork of the liveliest flowers, without that reserve and repose which is given by spaces and masses. Noise and vivacity is all that childish music contains, and primitive songs add little more of form than what is required to compose a few monotonous cadences. These limitations are not to be regretted; they are a proof of sincerity. Such simplicity is not the absence of taste, but the beginning of it. A people with genuine æsthetic perceptions creates traditional forms and expresses the simple pathos of its life in unchanging but significant themes, repeated by generation after generation. When sincerity is lost, and a snobbish ambition is substituted, bad taste comes in. The essence of it is a substitution of non-æsthetic for æsthetic values. To love glass beads is barbarous, perhaps, but not vulgar; to love jewels only because they are dear is vulgar; and to betray the motive by placing them ineffectively is an offence against taste. The test is always the same: Does the thing itself actually please? If it does, your taste is real; it may be different from that of others, but it is equally justified and grounded in human nature. If it does not, your whole judgment is spurious, and you are guilty, not of heresy, which in Æsthetics is orthodoxy, but of hypocrisy, which is self-excommunication from its sphere.

"Now, a great sign of this hypocrisy is insensibility to sensuous beauty. When people show themselves indifferent to primary and fundamental effects, when they are incapable of finding pictures except in frames, or beauties except in the great masters, we may justly suspect that they are parrots, and that their verbal and historical knowledge covers a natural lack of æsthetic sense. Where, on the contrary, insensibility to higher forms of beauty does not exclude a natural love of the lower, we have every reason to be encouraged; there is a true and healthy taste which only needs experience to refine it. If a man demands light, sound, and splendor, he proves that he has æsthetic equilibrium; that appearances as such interest him, and that he can pause in perception to enjoy. We have but to vary his observation, to enlarge his thought, to multiply his discriminations—all of which education can do—and the same æsthetic habit will reveal to him every shade of the fit and the fair."

Our purpose being not to analyze so short a book, but simply to call attention to its merits, we will content ourselves with once more quoting. Here is a passage in which Dr. Santayana treats of the quality of remote suggestiveness in objects of art:

"It is the free exercise of our activity of apperception that gives so peculiar an interest to indeterminate objects, to the vague, the incoherent, the suggestive, the variously interpretable. The more this effect is appealed to, the greater wealth of thought is presumed in the observer, and the less mastery is displayed by the artist. A poor and literal mind cannot enjoy the opportunity for reverie and construction given by the stimulus of indeterminate objects; it lacks the requisite resources. It is nonplussed and annoyed, and turns away to simpler and more transparent things with a feeling of helplessness often turning into contempt. And, on the other hand, the artist who is not artist enough, who has too many irrepressible talents and too little technical skill, is sure to float in the region of the indeterminate. He sketches and never paints; he hints and never expresses; he stimulates and never informs. This is the method of the individuals and nations that have more genius than art.

"The consciousness that accompanies this characteristic is the sense of profundity, of mighty significance. And this feeling is not necessarily an illusion. The nature of our materials—be they words, colors, or plastic matter—imposes a limit and bias upon our expression. The reality of experience can never be quite rendered through these media. The greatest mastery of technique will therefore come short of perfect adequacy and exhaustiveness; there must always remain a penumbra and a fringe of suggestion if the most explicit representation is to communicate a truth. When there is real profundity—when the living core of things is most firmly grasped—there will accordingly be a felt inadequacy of expression, and an appeal to the observer to piece out our imperfections with his thoughts. But this should come only after the resources of a patient and well-learned art have been exhausted; else what is felt as depth is really confusion and incompetence. The simplest thing becomes unutterable if we have forgotten how to speak. And an habitual indulgence in the inarticulate is a sure sign of the philosopher who has not learned to think, the poet who has not learned to write, the painter who has not learned to paint, and the impression that has not learned to express itself—all of which are compatible with an immensity of genius in the inexpressible soul."

But it seems absurd to quote one page more than another from the book. We recommend it most emphatically as one of the best contributions ever made to the subject—penetrating, perceptive, and judicious, and clad in a superlatively good English style.

History of Ancient Greek Literature. By Gilbert Murray. D. Appleton & Co.

Prof. Murray's volume is the first of the series of "Literatures of the World" which is being edited by Mr. Edmund Gosse, and it contains the editor's "General Introduction." We are disposed to believe that there must exist in the soul of the modern book-buyer an insatiate craving for uniformity and correlation, and that the publishers who issue 'Literatures,' 'Heroes,' and 'Epochs' by the series know their public better than we do. Nevertheless, the scholar will always have a rooted distrust of any scheme that would cut out his favorite literature by the pattern of any other. He will find nothing to allure in Mr. Gosse's promise that "great care will be taken to preserve uniformity of form and disposition, so as to make the volumes convenient for purposes of comparison, and so as to enable the literatures themselves to be studied in proper correlation." This will but suggest to him

the estimable efforts of the Chautauqua Reading Circle, for nothing will convince your scholar that a work that is "pleasant enough and picturesque enough to be studied by those who seek nothing from their books but enjoyment," can be to his address. It is nothing less than a slap in the face of the classical scholar of to-day to be told that Greek literature is "independent of philology and political history," especially when Mr. Gosse follows up this remarkable statement with the assurance that, "in preparing these books, the first aim will be to make them exactly consistent with all the latest discoveries of fact."

Let us see how Prof. Murray, in his treatment of Greek Literature, works out this idea of winning both votes. The editor's introduction was framed to catch the vote of the general public; Mr. Murray's preface quietly ignores Mr. Gosse and conciliates the scholar. "Our ultimate literary judgments upon an ancient writer," he says (p. xii), "generally depend, and must depend, upon a large mass of philological and antiquarian argument." He goes on to acknowledge his deep indebtedness to Von Wilamowitz-Moellendorff, "whose historical insight . . . has changed the face of many departments of Hellenic study within the last fifteen years." So much for Mr. Gosse's "self-reliant" Greek literature! Mr. Murray's conception of the Greek, as stated in his preface, rejects alike Pater's "æsthetic and fleshly" pagan and the "serene and classical" Greek of Winckelmann and Goethe. Without defining his abstract Greek, Mr. Murray gives us a fairly good negative idea of him—he is, we imagine, the mean of Dr. Johnson's "savages addressed by Demosthenes" and the radiant young demi-gods of Mr. Alma-Tadema's paintings.

In his chapter on Homer Mr. Murray makes more concessions to the learned than to the general reader. Yet we imagine that the scholar who is interested in dialects will seek elsewhere such a close discussion of Aeolic and Ionic as that to which Mr. Murray devotes five pages; in a work which, after all, is meant as a popular sketch, this space might have been more profitably given to quotations from or an analysis of the Homeric poems for the benefit of the general reader, for whom is assumed here a knowledge of Homer which he does not possess. Some account of the classical literary tradition regarding Homer and the influence of the poems on Greek literature and life we look for in vain. Passing to the Lyric Poets, we find scant notice given to Bacchylides, in spite of the recent discovery of several of his odes; here, again, one would have expected Mr. Murray to mention the high place accorded him by the ancients—a place for which it is hoped that the lately acquired poems may account.

The first half of the book ends with an excellent chapter on Thucydides, and the second opens with the drama. Mr. Murray seems to follow Dörpfeld on the question of the Greek stage (see p. 203). The treatment of Euripides is undoubtedly the best part of the book, because the most sympathetically written. Here Mr. Murray gives us the impression that he is really relating his own adventures with the masterpieces that he describes. Your genuine Ibsenite is always restlessly assuring the world that Ibsen is a classic; so Mr. Bernard Shaw announces once a week in the *Saturday Review* that he is vastly superior to Shakspere; so, in his turn, Mr. Murray makes the most of his opportunity and classes Ibsen with Aeschylus as a "Titanic mind" (p. 227), and tells us that the "Oedipus Tyrannus" of Sophocles reminds one of Ibsen's plays, because "the interest turns, not on what the characters do, but on their finding out what they have done." Is this fair to the general reader who knows his "Hedda Gabler" and his "Little Eyolf," but will never correct Mr. Murray's analogy by reading Sophocles? For there seems to us to be an immense difference between finding out what you have done (with Sophocles) and finding out after agonies of introspection what you *are* (with Ibsen). Mr. Murray goes on to compare the symbolism of the "Hippolytus" with the symbolism of "Brand." So that almost before we know it we are left with a trail of Ibsen over our conceptions of Aeschylus, Sophocles, and Euripides. This is a good instance of the fallacy of expressing the past in terms of the present; the writer who does this usually adds a qualification, but the reader carries away the wrong impression in nine cases out of ten. Mr. Murray does not follow the modern tendency, at any rate in Germany, to regard Demosthenes as a patriotic agitator whose influence over Athens was fatal and policy short-sighted. Adolph Holm's arraignment of Demosthenes, in his third volume, ought to have some effect on English scholars; Mr. Murray gives his readers the old-fashioned view of Philip as the villain and Demosthenes as the patriotic statesman.

To attack an author for his exclusions and his narrow range in a volume that was limited to 400 pages is so easy a task that the critic is disarmed. He can only deplore the fact that a historian who consents to survey Greek literature in so narrow a space is inevitably committed to the lamentable theory that Greek literature "stopped short at the cultivated court" of Alexander of Macedon. So it happens that Mr. Murray, like so many others, declines into the baldest summary of names and dates for the period following the death of Demosthenes. He allows a dozen pages only to the whole Greco-Roman period, and gives a bare page to Lucian, whom he calls a "second-century sophist," without having pointed out the enormous difference between the sophists of Plato's day and the showy declaimers who, under Hadrian and his successors, taught the art of using the Greek classics to ornament Roman life. To bracket Dion Chrysostomus with Herodes Atticus and Aristides as a "mere stylist" is an astonishing piece of criticism, unless one goes on to explain, as Mr. Murray does not, what an important and picturesque figure Dion's life and his record of it make him in that interesting and too-neglected period.

Of this whole Greco-Roman period we may say that one excellent way of seeing what classical literature was is by estimating what post-classical literature was not. When Dr. Verrall issues his 'Latin Literature' in this series, we do not expect to find in it that "correlation" with Mr. Murray's book so confidently predicted by the editor. For it is only by the study of Greek literature under the Roman Empire that we can understand the contemporary literature of Rome. Mr. Mackail, some years ago, did, brilliantly, for Latin what Mr. Murray has now done for Greek literature; he gave his quotations regularly in the original, and we wish that Mr. Murray could have done the same, at any rate in footnotes. We are surprised to see colloquialisms, such as "going one better" and "rubbing it in," in a work of serious scholarship which comes from that side of the water on which the Queen's English is supposed to be carefully guarded; the dropping of an "h" in Kirchhoff's name is an unexpected lapse in an author who owes so much to his study of the Germans. But, when all is said that can be said in criticism of Mr. Murray's work, it remains a powerful and original study; μωμήσεταί τις μᾶλλον ἢ μιμήσεται—it is easier to criticise than to imitate.

The Theory of International Trade: With Some of Its Applications to Economic Policy. By C. F. Bastable, M.A., LL.D. Second edition, revised. Macmillan Co. 1897. Pp. xii, 183.

After an interval of ten years, Prof. Bastable presents us with a new edition of his well-known work on international trade. While it has not been found necessary to make any structural changes, or to alter seriously the original materials, the book has been carefully revised, and its references have been brought thoroughly up to date. The author's first purpose is to subject the classical theory of international trade to a critical examination, and to determine the extent to which it requires restatement. In the opening chapter he considers the reasons that led English economists to formulate a special theory of exchange to explain the facts of international trade, and concludes that there are still substantial grounds to justify such procedure. Then he elaborates the doctrines of comparative costs and of the equation of reciprocal demand. The treatment of these subjects follows closely the traditional methods of presentation, but on some minor points a few oversights of other writers are corrected. Concerning the movements of money in international commerce, the author holds firmly to the supply-and-demand theory. Like all other writers upon this particular subject, he is unable to find a substitute for "the quantity theory of money." The last half of the work is devoted mainly to a consideration of the question of free trade and protection, to which the author applies consistently the theory that he has elaborated, even if he is unable to advance much that can be called original.

Undoubtedly such a book as this serves a useful purpose, but its methods of presentation are such as to limit its serviceableness in all except purely scientific circles. The author rightly enough directs his attention mainly to permanent results and to what holds true in the long run. He treats international trade as barter, and works out the theory of comparative costs in terms of units of sacrifice incurred in production. Such a procedure possesses scientific validity, but lacks the features that appeal to the understanding of those persons who have not had considerable training in economic studies. The man of business is confronted usually by the temporary results of economic causes. He knows that most international transactions are carried on by individuals, not by nations as such, and that international trade seems to be based upon differences of prices which are easy to understand. Moreover, he insists that exports are sold for money, and that imports are paid for in the same manner. If the subject

were one of purely academic interest, the economist might fairly overlook these facts; but its practical importance is so great that care should be taken to throw scientific discussion into a form that will be intelligible to persons who are not scientists. This it is not impossible to do. A little attention to immediate and temporary results, a statistical demonstration of the fact that, in spite of immediate appearances, imports do pay for exports in the long run, and a translation of the doctrine of comparative costs into the language of prices, would accomplish this end. The theory of international exchange may be made comprehensible to any intelligent man by such a mode of treatment, while all scientific purposes may be subserved equally well. Since Prof. Bastable fails to do this, his interesting and valuable book will, like most other works on this subject, end in little more than purely academic discussion.

Histoire de l'Ordre Lotiforme: Étude d'Archéologie Égyptienne. Par George Foucart, Licencié en Droit, Ancien Inspecteur des Fouilles et des Musées de l'Égypte, etc. Paris: Ernest Leroux. 1897.

The columns in Egyptian architecture have tempted archæologists, from De Quincy down, to discussions and theories, all turning to account in some way the manifest reminiscences of floral and vegetable prototypes which they display. There is a very obvious relation between the column as we find it and the innumerable representations of it in bas-reliefs and papyri. But there has been a gap which could not be filled up between the picture and the real thing; for though we have abundant remains of early Egyptian building, we have had no columns which could be dated farther back than about half way in the series—that is to say, to the twelfth dynasty. Those in the hypogees at Beni Hassan have been recorded in every book on the archæology of Egypt as the oldest in the world; but excavations at Abusir, three or four years ago, revealed a column of the so-called lotus-bud type in a mastaba or tomb which is clearly identified as a tomb of the fifth dynasty, so that it may be five hundred years earlier than those at Beni Hassan, or, according to some chronologies, eight hundred or a thousand. This discovery, of which an account was published in the *Revue Archéologique* in 1894 by M. De Morgan, has been used by M. George Foucart as the text for a careful monograph on the lotiform order.

The lotiform column predominates in Egyptian architecture: it is that of which the consecutive forms can be most clearly traced, the prevailing one in pictured representations, and, so far as evidence went, even before the discovery of Abusir, the oldest. M. Foucart traces its history in a way that was till now impossible. The actual prototype he believes to have been a wooden column, and he accepts the natural theory that the capital is an imitation of the bunches of lotus which the flower-loving Egyptians used to tie about the tops of the shafts. The theory of a metallic prototype, or even of floral ornaments of metal fastened to the top of the original column, stoutly maintained by Chipiez, he absolutely rejects, and with reason, we think. Tracing the gradual modification of the type in historical examples, he finds not only, as was to be expected, that it diverges steadily from the floral original, but that it falls away as steadily from the beauty of the oldest example at Abusir. This accords with what we know of Egyptian art, in which the elusive period of maturity continually recedes before investigation till there seems no room in history for the time of preparation. The new-found column not only is singularly clear and precise in its representation of a group of half opened lotus buds tied about the top of a fourfold shaft, but has a purity of outline and grace of proportion which are not matched in the later ones. The gradual transformation from imitative forms to purely lithic is shown with unexpected and convincing continuity in the successive examples which M. Foucart has collated, tracing the lotus-column down from the strongly naturalistic monoliths of Abusir and Beni Hassan to the huge and smoothly stuccoed pillars of the Ramassides at Karnak and Medinet Abu—amorphous forms which have so lost the lotus character that some archæologists have called them papyrus-bud columns. He does not convince us when he insists that the clustering of the stone column is simply a development of the square stone pier, dismissing the theory that it is inherited from the wooden original in an argument whose cogency we do not recognize; but he seems right in rejecting the theory of Lepsius and others that the column was born of an attempt to embody the whole growth of the plant, arguing that it began with the buds at the capital, and that the rest was an afterthought of the middle Empire.

M. Foucart keeps close to his main line of discussion, with but slight notice of the other well-known Egyptian types—the palm-leaf, the papyrus or bell-capital, the Hathor capital—but he has many interesting things to say of the development and progressiveness of Egyptian architecture, too often thought of as the type of immutability. We have not seen so adequate and satisfactory a discussion of any phase of Egyptian architecture as this book.

Griechische Geschichte. Von Julius Beloch. Strassburg: Trübner. 2 vols. 1893 and 1897.

An admirable feature of this work is its unity of plan. The reader of Beloch's history will be delighted to find himself pursuing, not the separate narratives of the leading cities, as Sparta, Athens, and Syracuse, but the history of Greece as a whole. Here is great improvement in the treatment of Grecian history, made more practicable, to be sure, by the moderate compass of the work, yet highly creditable to the author. It is to be hoped that future writers will in this respect work along the lines that Beloch has sketched. Equally commendable is his idea of making civilization rather than war the centre of interest. We owe to Greece our science, our art, and our ideals of political and intellectual liberty; how disappointing it is, then, in approaching almost any one of the smaller histories of Greece, to find but a dreary wilderness of military details! But Beloch has restricted himself more than any previous writer to the lessons which ancient Greece has to teach the moderns; he has described briefly the intellectual, moral, and æsthetic conditions of each stage in the development of the race, and has pointed out the influence of these conditions on society and government. It is, perhaps, in treating the economic side of Grecian history that Beloch shows most originality and ability, and has made his largest contribution to existing knowledge. His service in this is especially opportune at the present time, when economic questions are of supreme interest.

His method is critical—he bases his treatment on a careful examination and estimate of the sources; he is the pronounced foe of "mere hypothesis." In some instances, however, he has not lived up to his own ideal. We find him occasionally offering conjecture as unconditioned fact. On the other hand, he often pushes his critical method to extremes, thus relegating well-evidenced facts to the limbo of myth. This criticism should not apply to his disbelief in a Dorian migration. The theory of a Dorian conquest of the Peloponnesus, though not utterly overthrown by Beloch, has experienced a severe shock at his hands, and with it those "aristocracies based on conquest" of which too much has recently been made. Sometimes Beloch seems unjust in his judgment of men and political parties. For instance, he assumes without convincing evidence that Pericles precipitated the Peloponnesian war to extricate himself from political complications at home. And in his treatment of the Athenian democracy, he does not seem to be aware that its faults were not peculiarly democratic, but are to be found recurring in other forms of government, ancient and modern. This unfairness comes in part from his too confident use of partisan literature as evidence. The theory that each form of government has its peculiar ethical flavor—a theory very attractive to the Greeks—is no longer tenable. Yet if comparisons are of any value, no one acquainted with the facts could say that the Athenian democracy was less moral or less humane than the Athenian oligarchies, the Spartan aristocracy, or the monarchy of Philip and Alexander. But Beloch confesses that he is politically biassed by his surroundings: "ein begehrliches Proletariat und ein ebenso begehrliches Junkertum" have led him to sympathize with Theramenes's attempt to restrict the Athenian franchise to those possessed of a certain property qualification, an attempt to straiten still further the life of a city-state already dying of political illiberality. Beloch offers nothing substantial to prove that Theramenes's ideal was either good in itself or practicable. In short, he represents the anti-democratic tendency now prevalent in the treatment of Grecian history.

We miss also in Beloch's work the interest and inspiration that come from contact with the brilliant personalities of Greece. In the prominence which he gives to the race, the individual recedes into the background. Lycurgus, Pericles, and Alexander have indeed been overdone, and it is well to call attention to other things in history than the doings of eminent men; but Beloch appears to have underestimated the influence of great personalities on their age. Also, the reader of conventional Greek history will be constantly surprised at Beloch's treatment of leading characters. He will find Dionysius I., once the bloody tyrant of Syracuse, now cleanly washed and habilitated as becomes a great general, statesman, and tragic poet; Eubulus, a prudent statesman wisely developing and conserving the resources of his country; and Epaminondas, still one of the ablest military leaders of all time, yet lack-

ing in statesmanlike foresight and breadth of view, introducing no new principles into politics, but only aggravating the evils of city hegemony. Beloch's treatment of the political tendencies of the fourth century is fresh and suggestive; and indeed his entire work shows a thorough mastery of the available sources, a discrimination in the selection of material, and on the whole a moderation and soundness of judgment that will make it an indispensable help to every careful student of Grecian history.

BOOKS OF THE WEEK.

Barbèra, P. Autori e Editori. Florence: S. Landi.
Bompiani, Sophia V. A Short History of the Italian Waldenses. A. S. Barnes & Co.

Tyler, Prof. C. M. Bases of Religious Belief, Historic and Ideal. Putnams. $1.50.

"Written with a skill that loses nothing of its effect through being accompanied by an air of freshness, this group of three stories suggests that the author could write as many more and never allow his spirits to flag. Nor would his inventiveness weaken. Apparently there is no limit to it. The situations in these plots grow funnier and funnier. In the last Mr. Foster rises to heights of comicality. Moreover, he never ceases to be plausible, . . . He contrives to body forth his most fantastic personages in a realistic manner. . . . A volume to captivate and to leave a pleasant memory behind."

Apply to ALBERT & CLARK, Pullman Building, Chicago.

SCHERMERHORN'S TEACHERS' Agency. Oldest and best known in the U. S. Established 1855. 3 E. 14th St., N. Y.

An Agency is valuable in proportion to its influence. If it merely hears of vacancies and tells **that** is something, but if it is asked to you about them recommend a teacher and recommends you, that is more. Ours **Recommends**
C. W. BARDEEN, Syracuse, N.Y.

Teachers, etc.

AN EPISCOPALIAN CLERGYMAN wishes to receive into his family two youths or young men for preparation for or the forwarding in their college or other educational course. An exceptional climate permits such work under the most favorable conditions, and the most thorough, conscientious oversight of study, as well as instruction, is assured. The pupils of the gentleman have always gone beyond their class, and have attained fine physical condition.

Golf, tennis, and basketball clubs afford means of daily outdoor exercise; instruction and practice in horseback riding, with so much of the military setting-up drill as the daily inspection by a fine physician connected with the U. S. Army deems conducive to health and of use in forming an erect, easy carriage; lessons in dancing and attendance (unless otherwise desired) at the informal post hops are great factors in the same direction. A large, well-furnished house, abundant, pure water, well-ventilated sleeping room, good library, quiet, refined home life; abundant, well-served table, and constant, careful supervision of clothing, and everything conducive to the comfort of pupils will be given.

The terms, including use of a piano if desired, instruction in German and French by native teachers, are one thousand dollars ($1.000) per year, one-half in advance, balance at the commencement of last half of year. Will take them September or earlier if desired. Address "INSTRUCTOR," Fort Logan, Colorado.

Full particulars given by mail, or will welcome a personal discussion if desired.

*LECTURER ON THE FRENCH LANG*uage and Literature required for Victoria College, Toronto. Must be an experienced teacher and competent to give instruction in the French Language as required by the Curriculum for the B.A. degree in all Departments of the University of Toronto. Duties to begin with opening of session, 1897-98.

Applications, with testimonials, to be sent before August 1 to N. BURWASH, LL.D., President, Victoria College, Queen's Park, Toronto.

*A SPECIALIST IN MODERN LAN*guages, History, Literature, and Political Science, native of Hanover, Germany, Ph.D., A.M., Graduate of Vienna, Paris, and Kentucky Universities, desires a professorship in a good college; 20 years' experience; finest references; moderate salary. Apply WINFIELD BUSINESS AND ACADEMIC COLLEGE, Winfield, Kansas.

A VERY SUCCESSFUL TEACHER, having given up his position for the special study of Greek and German abroad, is open for an engagement. Would also teach Latin or History. Best references. PH.D., care of the *Nation*.

CLASSICS, HISTORY.—An experienced and successful teacher, A.B. of a Northern College, Ph.D. of Johns Hopkins, now professor in a Southern College, wishes position in Northern College or School. Address M. M., care the *Nation*.

*TUTORING IN MATHEMATICS, AS*tronomy, and Physics at pupil's residence. F. H. SAFFORD, Ph.D., Instructor in Harvard University. Address Box 45, Andover, Mass.

AMERICAN SCHOOLBOYS to Sixteen. —A Talk with Parents on a Course of Education, by EDWARD ROTH, A.M. 30 pp. Mailed to any address on receipt of 10 cts. 1135 Pine St., Philadelphia.

*LIBRARIAN OF UNIVERSITY LI*brary, nine years' experience, seeks another position. Address "LIBRARIAN," care *Nation*.

*CHARLES W. STONE, Tutor for Har*vard, 68 Chestnut Street, Boston.

Educational.

CALIFORNIA, Belmont. (In the foothills near San Francisco.)

BELMONT SCHOOL for Boys hopes to deserve the confidence of Eastern as well as of Western parents by surrounding its boys with as stimulating an intellectual, spiritual, and physical life as is found in the best Eastern schools, and by offering a home which in beauty of surroundings and fineness of climate for sustained work no Eastern school can hope to equal. It should give to its boys a healthful impulse towards good thinking and good living, and leave with them a heritage of pleasant and helpful memories.

The catalogue, containing views of the school and a record of the colleges and technical schools entered by its graduates, will help to give an idea of its spirit and the work it is doing.

W. T. REID, A.M. (Harvard), Head Master.

Prepares for Colleges and Government Schools. Thorough business course. *Open all Year.* Fall term Sept. 15. Col. L. H. ORLEMAN, Prin., Peekskill, N. Y.

1875 SUFFOLK MILITARY ACADEMY. 1897

A healthful and delightful Virginia home for boys. Its pupils are now filling high positions in 20 states. Instructors of experience from Harvard and the University of Va. JOSEPH KING, A.M., Prin., Suffolk, Va.

Educational.

WELLS COLLEGE,
AURORA, N. Y.

This institution is provided with a faculty drawn from the best colleges of the country; it is steadily increasing its facilities in library and in apparatus. It offers a number of scholarships to students of ability who need them. Ninety-one courses, required and elective, are offered this year. Wells College is known as a small, but thorough college; it believes that, as such, it can offer young women unique and desirable advantages. For catalogues, address Dr. WILLIAM E. WATERS, President.

West Newton English and Classical School.
Family and Home School for both sexes.
(45th Year.) Apply to ALLEN BROTHERS.

KINDERGARTEN NORMAL COURSE,
ETHICAL CULTURE SCHOOLS, 109 West 54th Street.
JOHN F. REIGART, Superintendent.
Miss CAROLINE T. HAVEN, Principal

SUMMER COACHING SCHOOL
At Bay Shore. WM. S. GREENE, H. F. KRAFFT, Prins., Bay Shore, Long Island.

Teachers, etc.

AN EPISCOPALIAN CLERGYMAN wishes to receive into his family two youths or young men for preparation for or the forwarding in their college or other educational course. An exceptional climate permits such work under the most favorable conditions, and the most thorough, conscientious oversight of study, as well as instruction, is assured. The pupils of the gentleman have always gone beyond their class, and have attained fine physical condition.

Golf, tennis, and basketball clubs afford means of daily outdoor exercise; instruction and practice in horseback riding, with so much of the military setting-up drill as the daily inspection by a fine physician connected with the U. S. Army deems conducive to health and of use in forming an erect, easy carriage; lessons in dancing and attendance (unless otherwise desired) at the informal post hops are great factors in the same direction. A large, well-furnished house, abundant, pure water, well-ventilated sleeping room, good library, quiet, refined home life; abundant, well-served table, and constant, careful supervision of clothing, and everything conducive to the comfort of pupils will be given.

The terms, including use of a piano if desired, instruction in German and French by native teachers, are one thousand dollars ($1.000) per year, one-half in advance, balance at the commencement of last half of year. Will take them September or earlier if desired. Address "INSTRUCTOR," Fort Logan, Colorado.

Full particulars given by mail, or will welcome a personal discussion if desired.

LECTURER ON THE FRENCH LANGUAGE and Literature required for Victoria College, Toronto. Must be an experienced teacher and competent to give instruction in the French Language as required by the Curriculum for the B.A. degree in all Departments of the University of Toronto. Duties to begin with opening of session, 1897-98.

Applications, with testimonials, to be sent before August 1 to N. BURWASH, LL.D., President, Victoria College, Queen's Park, Toronto.

A SPECIALIST IN MODERN LANGUAGES, History, Literature, and Political Science, native of Hanover, Germany, Ph.D., A.M., Graduate of Vienna, Paris, and Kentucky Universities, desires a professorship in a good college; 20 years' experience; finest references; moderate salary. Apply WINFIELD BUSINESS AND ACADEMIC COLLEGE, Winfield, Kansas.

TUTORING IN MATHEMATICS, ASTRONOMY, and Physics at pupil's residence. F. H SAFFORD, Ph.D., Instructor in Harvard University. Address Box 45, Andover, Mass.

AMERICAN SCHOOLBOYS to Sixteen. —A Talk with Parents on a Course of Education, by EDWARD ROTH, A.M. 30 pp. Mailed to any address on receipt of 10 cts. 1135 Pine St., Philadelphia.

LIBRARIAN OF UNIVERSITY LIBRARY, nine years' experience, seeks another position. Address "LIBRARIAN," care *Nation*.

CHARLES W. STONE, Tutor for Harvard. 68 Chestnut Street, Boston.

School Agencies.

ALBANY TEACHERS' AGENCY. 24 State St., Albany, N. Y.—Provides schools of all grades with competent teachers. Assists teachers in obtaining positions. HARLAN P. FRENCH, Manager.

FOR COLLEGE POSITIONS IN THE WEST, Apply to ALBERT & CLARK, Pullman Building, Chicago.

SCHERMERHORN'S TEACHERS' AGENCY. Oldest and best known in the U. S. Established 1855. 3 E. 14th St., N. Y.

An Agency is valuable in proportion to its influence. If it merely hears of vacancies and tells **that** is something, but if it is asked to you about them recommend a teacher and recommends you, that is more. Ours **Recommends**
C. W. BARDEEN, Syracuse, N.Y.

Authors and Publishers

A Manual of Suggestions for Beginners in Literature. Comprising a description of publishing methods and arrangements, directions for the preparation of MSS. for the press, explanations of the details of book-manufacturing, instructions for proof-reading, specimens of typography, the text of the United States Copyright Law, and information concerning International Copyrights, together with general hints for authors. By G. H. P. and J. B. P. Seventh edition, rewritten, with new material. 12mo, gilt top, $1.75 *net*.

"A work that ought to be in the hands of every one who purposes to make authorship a vocation or an avocation. . . . The volume includes a suggestion for the institution of a Literary Court or Board of Arbitration for the settlement of disputes between writers and publishers; a suggestion which seems to us to be in no wise chimerical, and which would at once test the reality of the proverbial grievances on the part of authors."—[New York Nation.

An American Emperor.

The Story of the Fourth Empire of France. By LOUIS TRACY, author of "The Final War," etc. Illustrated. 8vo, $1.75.

"'An American Emperor' is a notable book. The plot is skilfully constructed, and the many dramatic incidents are well described."—[N. Y. Herald.

"This is a rattling good story of intrigue, plot, counterplot, adventure, fight, and phenomenal undertakings."—[Boston Herald.

G.P. PUTNAM'S SONS
27 and 29 West 23d St., New York.

Publications in French.

Attention is called to the following series of reprints, as of great value to the student as well as to the general reader of French.

Romans Choisis.
12mo, paper, 60 cents; cloth, 85 cents.

No. 7. L'OMBRA. By A. GENNEVRAYE. 216 pages.

No. 8. LE MAITRE DE FORGES. By GEORGES OHNET. 341 pages.

Complete catalogue on application. For sale by all booksellers, or postpaid on receipt of price by the publisher,

William R. Jenkins
851 and 853 Sixth Ave. (48th St.), New York.

Midsummer Holiday Number OF THE CENTURY

August Ready Saturday, July 31.

TRAVEL NUMBER.

Castaigne's Splendid Panorama of THE HUDSON RIVER.

A series of large pictures illustrating the Hudson from the Statue of Liberty to Albany, with an article on "The Lordly Hudson," by Clarence Cook.

THE ALASKA TRIP

described by John Muir, after whom the famous "Muir Glacier" was named. Illustrated.

A JOURNEY IN THESSALY,

by Prof. Goodell of Yale, setting forth the scene of the recent fighting between Turk and Greek.

NORWAY.

Articles by Horace E. Scudder and the late H. H. Boyesen, with photograph of the midnight sun.

DOWN TO JAVA,

by Eliza Ruhamah Scidmore, author of "Jinrikisha Days," with a great number of illustrations.

ON MARGATE'S SANDS.

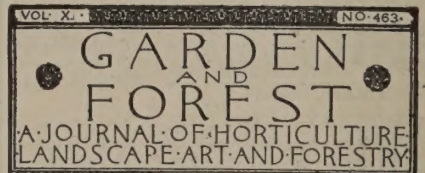
The Coney Island of London described by Mrs. Pennell, with pictures by Joseph Pennell.

Secret History.
UNPUBLISHED FACTS RELATING TO THE IMPEACHMENT OF PRESIDENT JOHNSON.
By JOHN M. SCHOFIELD, Lieutenant-General U. S. A., Retired.

OTHER ILLUSTRATED ARTICLES, SHORT STORIES, Etc., Etc.

Sold everywhere. Price 35 cents.
THE CENTURY CO., N. Y.

Practical. Popular. Scientifically Exact.



Treats of the science and the art of gardening, and is a trustworthy record of progress in horticulture. The weekly issues contain practical directions for cultivation under glass and out of doors, correspondence on seasonable topics, editorials and articles on forestry, and on legislation affecting the national forests. The contributors are botanists and specialists of the highest standing. The illustrations are original, accurate, and artistic.

"Winning, delightful, and accurate."—*N. Y. Tribune.*

Tribune Building, NEW YORK.

The Nation.

NEW YORK, THURSDAY, JULY 29, 1897.

The Week.

The closing days of the tariff debate brought out some good speeches in the Senate, none more effective than the protest of Mr. Pettigrew of South Dakota against the duty of $2 a thousand on white pine, which is double the rate fixed in the McKinley law. This will shut out Canadian lumber, and enable a few owners of timber in Michigan, Wisconsin, and Minnesota to pocket millions of dollars a year from the many thousands of people in this country who must buy lumber. "It is a tax," said Mr. Pettigrew, "not to go into the Treasury, but a tax of $2 on a thousand to be paid into the pockets of these enormously rich men who own the timber," and he asked his Republican colleagues, "How can you justify it? How can you go before the consumers in the States where this lumber is situated and justify it?" The Senator from South Dakota declared that "the bill is full of just such propositions from beginning to end," and expressed this opinion of the measure as a whole, which will be endorsed by impartial people who have carefully studied it:

> "I have watched the passage through the two houses of Congress of the last three or four tariff bills. I was in the other house in 1883, and in this body in 1890 and 1894, when tariff bills were passed, and now again during the pendency of this bill, and this is the worst tariff bill ever conceived or produced. As tariff bills are produced, their framers become more expert in juggling with phrases, covering up what they intend to do and so fixing them that the classes will be enabled to plunder the masses."

In his opening speech on the tariff conference report, Mr. Dingley said without a blush that "he regretted that the Senate had not allowed the retroactive clause of the bill to stand, at least until the bill was about to become a law, because if it had remained, $25,000,000 would have been saved to the Treasury." This was an avowal that the retroactive clause was a "bluff," intended to scare importers from the exercise of their legal rights. So it was said at the time by the opponents of the clause. It was affirmed that Congress had no intention of passing such a provision, and that it would be rejected by the courts if passed. Now it is admitted that the main object was to intimidate importers. But would the Treasury have gained $20,000,000 in this sneaking, underhand way? It is impossible to think so. Any merchant or manufacturer possessing the capital or credit to make importations in advance of his wants would have done so in either case, relying on the courts to upset an obviously unconstitutional act. The only thing that the Government has lost has been a long-drawn litigation, with a prospect of humiliating defeat in the end.

Mr. Dingley's cry for haste with the tariff, on the ground that every day's delay meant a loss to the Treasury of $100,000, sounds hollow in the face of the actual returns. In New York the receipts for Dingley's first day were $128,000, as against $361,000 for Wilson's last day—a clear loss of more than $200,000 caused by the advent of Dingley. Taking the figures for the country as a whole, the comparison is still more instructive. On July 20, when Dingley was clamoring for speed with his tariff to save the Treasury from loss, the receipts from customs were $1,679,631; on July 21, $2,433,435; on July 22, $1,153,890. Mr. Dingley's first full day, July 26, brought in $674,521—in other words, a loss to the Treasury of $900,000 a day, taking the average of the three days when he was shouting that every day's delay cost the Government $100,000. The deficit for July up to date is $10,000,000, and would be much larger but for the extraordinary receipts under the Wilson bill. When the unaided Dingley bill gets to work, we shall have some magnificent monthly deficits to carry the fall elections with.

The Senate committee to investigate the civil-service system has discontinued operations until next fall. It has conspicuously failed in the object of its appointment, which was to discredit the reform. In point of fact, its work has been distinctly favorable to the merit system, as must be the case with every investigation. For example, the Government Printing-Office, with its thousands of employees, has been the object of special assaults by those who would restore the old régime of appointment through political "pull," but the evidence taken as to this establishment has conclusively proved that the application of the civil-service rules has resulted in a great saving of money as well as a marked increase of efficiency. Senator Pritchard and his colleagues of the investigating committee will doubtless make a feint of further effort to establish the spoilsmen's case, but they must see, like everybody else, how hopeless is such a task.

The committees of the House resemble those of the last House almost as closely as differences in membership will permit. There is scarcely a change in the chairmanships of the dozen or fifteen most important. The list illustrates afresh the great advantage which a district gains from keeping its Representative long in service, since a man of only moderate ability will thus ultimately work his way to a committee position of importance. One reason why New York has fared so poorly in comparison with Maine in this matter is the strength of the "rotation-in-office" principle in this State, as against the pronounced tendency down East to reëlect a Representative term after term. New York fares rather better than usual in the committee assignments this time, and one reason is the fact that an uncommonly large proportion of the present delegation are old members.

Poor Mr. Sherman, on his way to Amagansett, leaves behind him a train of interviews on the subject of the famous Bering Sea dispatch and cognate questions. He says that he did sign the dispatch, and that it was the subject of careful consideration between himself and the President, and that they were in full accord about it. This puts the responsibility for the "shirt-sleeves dispatch" where it must fall eventually, because the President is responsible in a peculiar sense for our relations with foreign governments. We are sorry to believe that that dispatch embodies Mr. McKinley's ideas of what belongs to the dignity of the nation, but, however that may be, there are still some unsolved mysteries connected with it. One is the question how Mr. Sherman came to tell Mr. Smalley, the London *Times's* correspondent, that there was no such dispatch in existence; that is, no dispatch of an irritating character. The other is how the dispatch came to be published. Perhaps Mr. Sherman does not consider it irritating to accuse your correspondent of bad faith. Even prize-fighters think differently. The correspondence that passed between the backers of Corbett and Fitzsimmons was much aggravated by charges of this kind. According to one interview, Mr. Sherman is convinced that Lord Salisbury does not consider it irritating, because he has not answered it at all, and that the only persons ruffled by it are the editors of the English newspapers. On the whole, we think that it is time for Mr. Sherman to take a vacation.

The answer of the Japanese Minister to Secretary Sherman's note of June 25 is a calm discussion of the legal and diplomatic questions involved. Minister Hoshi spikes the Jingo gun, and wrings the soul of Roosevelt, by repeating that "Japan has absolutely no designs of any kind whatever inimical to Hawaii." Japan has, in fact, no motive in interven-

ing in the annexation business except to safeguard the rights of 25,000 of her subjects resident in the islands. That is no crime; it is not even an insult, warranting Mr. Roosevelt in organizing the naval militia on the great lakes for the purpose of repelling the Japanese ironclads when they appear in those waters. Mr. Sherman had asserted that the "vested rights" of the Japanese in Hawaii would be respected by this country. The Japanese Minister now asks him what he means by "vested rights." Does he mean what Mr. Bayard meant in 1886 when he told the German Minister that this country would expect "the well-established rights" of its citizens in the Pacific islands, then put under a German protectorate, to be respected? Mr. Bayard explained the phrase to mean that American citizens would not be disturbed in their rights of residence or intercourse or discriminated against. If Secretary Sherman intends to adopt this American contention, well and good. But the Japanese Minister fears that nothing of the kind is intended; that the extension of our naturalization and immigration and customs and navigation laws to Hawaii would work serious harm to Japanese interests, and that the pending claims of Japan against Hawaii would be difficult of collection after annexation. If these fears are groundless, it is for Mr. Sherman to say so, and give a guarantee that they are. Japan is perfectly within her rights in wanting to know about this; she would be derelict in her duty if she did not want to know.

Silver bullion in London touched on Wednesday the lowest point in its history, selling at 26⅜ pence per ounce, as against 27 pence, its previous lowest, in March, 1894. During the break in silver in 1894, wheat sold in New York at 60 cents per bushel, a decline of 7 cents since the opening of that year. The bimetallists made much of this simultaneous decline in wheat and silver. It was in vain that students of the commercial markets pointed out the fact that the world's wheat crop of 1893 had turned out 61,000,000 bushels larger than the crop of 1892, and that the outlook for 1894 favored an even larger yield. As a matter of fact, the United States alone, in 1894, produced 50,000,000 bushels more wheat than it produced in 1893, while the whole world yielded 50,500,000 bushels more wheat than in 1893, and 121,500,000 more than in 1892. But this did not convince the bimetallists. Wheat and silver were declining in price together—what further proof could be asked by a reasonable man?

These *post-hoc* reasoners must now consider the present movement of the markets. Silver bullion is selling in London exactly 5¼ pence per ounce below the price of a year ago; wheat in New York is selling 18½ cents higher than it sold a year ago. The student of statistics is as ready now as he was in 1894 to explain the reason for both movements; he will point out that the world's wheat yield of the past season fell nearly ninety million bushels under that of 1895, and that the outlook for this season's harvest, in the world at large, foreshadows no increase, and possibly a further shortage. As for the decline in silver, he needs to point only to the fact that American exports of silver bullion, for the twelve months ending June 30, 1897, have increased $1,400,000 over the same twelve months a year ago, and $14,600,000 over 1895; this, too, at a moment when the world at large is dispensing rapidly with the use of silver.

It is encouraging to find that an effective fight is to be made, in at least one State in the South, against the threatened relapse into barbarism through lynch law. While the Mayor of Griffin says that he would have helped to lynch a negro the other day if he had known that the outrage was to be committed outside of the city limits, and the editor of an Atlanta daily applauds those who hang and even burn men accused of crime, the Governor of Georgia issues a manly protest against the practice, in which he impresses upon the people "the enormity of the wrong done by so-called lynch law to the reputation of the State, to civilization, and to the rights of man." Gov. Atkinson tells officers of the law that it is their duty to take the lives of their assailants, if necessary to protect prisoners in their charge, and urges the passage of a law requiring a thorough investigation in every case of lynching, and providing adequate punishment when the officer falls short of the full measure of his duty. Georgia has a Governor of whom it ought to be proud, and it must be that the people will in the end rally to his support. Hopeful signs that this will happen are found in the vigorous expressions of opinion against lynching by leading citizens of the State which are contained in a letter from Atlanta published in the *Evening Post* of Saturday.

The tendency to impose what are essentially legislative powers and duties upon the judiciary suffers a check in Connecticut at the hands of the judiciary itself, through a decision just rendered by the Supreme Court. A law had been passed providing that, when a street-railway company wants to begin business, it shall submit its plans to the city council, which has sixty days within which to establish regulations for the location, construction, and operation of the line; but that, if the council shall not act within this period, any judge of the Superior Court, upon application from the company, may exercise the same powers. Such a contingency arose in Norwalk, and Judge Hall decided how the road should be located and constructed. The Supreme Court annuls his action, on the ground that the law under which he proceeded is unconstitutional, because it imposes upon the judiciary powers which are essentially legislative, whereas such powers are explicitly restricted by the Constitution to the legislative branch of the government. In this case only the duty of making certain regulations as to the conduct of a street railway was immediately at stake, but the decision holds that the whole question of a separation of the three departments of the government was involved, and that "the power to make the Superior Court a subordinate legislative body for one purpose involves the power to so utilize it for every purpose."

The Counsel for the Corporation of Brooklyn has rendered an opinion which is certainly in the interest of humanity. The people of New York have ordained in their Constitution that goods produced by convicts shall not be sold or given away to any person, firm, or corporation. But they also ordained that such goods might be disposed of "to the State or any political division thereof, or for or to any public institution owned or managed and controlled by the State or any political division thereof." The municipalities of the State are, of course, corporations, and are thus prohibited by name from using convict-made goods, unless such municipalities are "political divisions of the State." The opinion just rendered is to the effect that cities are such political divisions. The debates in the constitutional convention plainly show that it was believed that the public institutions in the various cities would make use of the prison products. Indeed, it is not improbable that this belief led to the adoption of the clause in the Constitution which forbade the traffic in these products. Moreover, the Legislature explicitly ordained that the labor of the convicts in the penitentiaries should be devoted primarily to the counties in which the penitentiaries were located, "and to the towns, cities, and villages therein." It further provided that the prices of these products furnished to the political subdivisions of the counties should be fixed, in New York and Kings Counties, by the Commissioners of Charities and Correction. It seems, however, that the county of Kings is restrained by law from purchasing supplies, and hence the duty would necessarily devolve on the authorities of the city of Brooklyn, or else the statute would be futile. While the possibility of this result does not make the statute constitutional, it is of some weight in determining the question. If the statute is unconstitutional, the fate of our con-

victs promises to be miserable in the extreme, for there would then be no way of providing them with any regular useful employment, and we might as well set up the tread-mill once more.

The managers of our transportation companies are so constantly the subjects of denunciation that it seems a rather irregular thing to praise them; nevertheless, they are occasionally exposed to such treatment. The New York Central Railroad Company, for instance, has settled some claims made against it by the village of Frankfort in a manner which can only be described as generous. It seems that when the West Shore Railway was constructed, the people of Frankfort expended $77,000 in buying the site on which the repair-shops of that railway were erected, supposing, of course, that these shops would be permanently used, and that the population of the village would be thus increased. As a matter of fact, the population did increase, and the village spent nearly $77,000 more in building a school-house and constructing water works. The Central Railroad, which had bought the property of the West Shore at foreclosure sale, found after a time that the Frankfort shops could not be advantageously maintained, and transferred the machinery elsewhere, thus causing a great decrease in the population of the village and in the value of property situated there. It seems probable from the manner in which the Central Road acquired the property of the West Shore that it could not have been compelled by the village of Frankfort to maintain its shops there. At all events, it could have resisted such a claim in the courts and delayed its adjudication indefinitely. Instead of doing so, it has agreed to turn over all its unused shops and lands at Frankfort to the citizens, to be leased by them to manufacturing establishments; to pay one-third of the water-works bonds; and to assume the payment of the whole of the debt incurred for the school building. Damages for breach of this agreement are fixed at $100,000. It is reported to be the general opinion at Frankfort that the Central Road has behaved very honorably in this matter, and this opinion will not be confined to that village. Money spent in such a way by a railroad brings a return in public favor which may be worth more in the end than a legal victory.

It takes some weeks after the adjournment of a Legislature to fathom all the absurdities in the way of lawmaking which it has perpetrated. In Nebraska what is called a life certificate for a teacher—that is, a voucher of fitness for service, which, once received, answers for all time—has hitherto been granted to any graduate of the State university or State normal school who has proved his efficiency by actual teaching experience, and to other experienced teachers who have successfully passed the required examination. It has just been discovered that an act was pushed through the last Legislature without attracting notice, which authorizes the issue of such certificates on presentation of diplomas granted by private normal schools which make a showing that they are possessed of property valued at $100,000. The idea that the ownership of a fixed amount of property insures a high standard of education on the part of an institution is only less grotesque than in the case of a man. The finishing touch of this extraordinary performance is the fact that the recognition of "the money power" was made by a Legislature in which the Populists held absolute control.

That is a fine point in theology which the Hod-Hoisting Engineers' Union has propounded to Bishop Potter—"If a church or cathedral be built by non-union men, should it be attended by union worshippers?" The matter is not so simple as it might look. A sense of peace—peace "with myself, the world, and Thee," as the hymn says—is essential to the spirit of true worship. But how could a union worshipper be at peace with the world, or even with himself, when within walls which unhallowed non-union hands had reared? Such a man would come under the Scriptural injunction bidding worshippers who have aught against their brother to go first and be reconciled to him—in this case, to go out and revile him as a "scab" and take his job away from him. The Hod-Hoisters do well to call attention to these matters, and a stanch upholder of trades unions like Bishop Potter will find it hard to say why churches should not wear the union label, as well as bread and shoes. Here is a great chance, undoubtedly, to bring the masses to church. Let everything about the sacred edifice be guaranteed strictly union-made; let the Scripture lesson be slightly altered so as to read, "Except the Union build the house, they labor in vain that build it," and the problem would be solved. At any rate, if workingmen do not flock to the Cathedral of St. John the Divine when it is completed, their excuse and justification will be, before the world—non-union men were employed in constructing it. Moreover, they can truthfully say that they warned the ecclesiastical authorities in time.

In the House of Commons on Monday, on a motion to pursue the inquiry into the Jameson raid, Mr. Chamberlain defiantly eulogized Rhodes, affirming that he had "done nothing to affect his personal character as a man of honor," and asserting that the Government proposed to honor him instead of punishing him; and the House, by a vote of 304 to 77, negatived Mr. Stanhope's motion to push the inquiry to the end. This, be it remembered, was only a few days after Mr. Hawksley, Rhodes's solicitor, had openly challenged the Commons to call upon him, if it dared, for the tell-tale telegrams in his possession. The fact that the Liberal leaders acquiesced in this cowardly policy of hushing up the inquiry can be accounted for only on one supposition. It is the one openly asserted in the Continental press, namely, that the telegrams would have involved members of the royal family as well as the Government.

No more striking testimony to the benefits conferred on Egypt by the English occupation has been given than that of the son of a man who was exiled for deeds committed in support of the revolt of Arabi Pasha. Writing to an Arabic journal, in reply to an attack made by another Arabic journal on the English, this person enumerates the following differences between the present and the past condition of the Egyptian people. Formerly the Government collected taxes to the amount of nearly $23 per feddan, or acre; now the taxes are about $7.50 per feddan. Formerly the rulers insulted, flogged, and imprisoned the subjects with impunity; to-day the poorest peasant is protected against assault, and corporal punishment is abolished. Formerly the peasants were plundered by the whole body of office-holders; now not even the Khedive can take a piece of land without the owner's consent. The rulers formerly monopolized the Nile water for the irrigation of their own lands, but under the present government the poorest fellah has the same water rights as the highest dignitary. Offices were formerly given to those who paid the most for them, but they are now allotted to the most capable. The public lands and the public funds were treated by the Khedive as his own possessions, while they are now preserved for the common advantage. The Khedive and his officers and friends used to compel the fellaheen to dig canals and construct embankments for the improvement of their private estates, in addition to what was required of them for public purposes, whereas labor is now compulsory only in times of danger. Several other particulars are mentioned in this remarkable tribute to the advantages of orderly government over despotism, which concludes:

"Such are the benefits of the British occupation, and I do not understand how the pretended patriots who run counter to the existing régime can deny their existence, seeing that they shine as the sun at noonday. The pretended patriots would do better by keeping silence and leaving the occupiers of the country to complete their humanitarian work."

THE PROPOSED MONETARY COMMISSION.

As the extra session drew to a close, it was evident that Mr. McKinley had fatally inverted the order of his subjects. If he had really and intelligently had the reform of the currency at heart, there is no doubt that he could have secured it, or at least a long step towards it, by giving it first place and pushing it with all his power. To have secured the appointment of a currency commission would have been a simple affair. Even some positive legislation might have been obtained, if Mr. McKinley had thrown himself into the task with the same absorbing energy that Mr. Cleveland expended on the Herculean labor of getting *his* extra session to repeal the Sherman law. He would have had with him the gathered impetus of the great electoral victory, of months of discussion, of an aroused and expectant public sentiment. But all this he threw away when, reversing the order of his letter of acceptance, reversing the order of his inaugural address, he put the tariff first before Congress and gave to currency reform not so much as the honor of a passing reference. His tacit orders to sacrifice everything to the tariff have been but too well obeyed. Keeping back his currency message to the end of the session, he finds that it, too, has been sacrificed to the tariff. The keepers of his honor in the Senate made pledges that no such message should be sent, or that, if it were sent, the Republicans in that body would pay no attention to it. The tariff has not been jeopardized, but everything else, including the President's authority, has been.

The closing scene of the session had something of the appearance of a farce. The oft-heralded message on the subject of a currency commission was sent in a few hours before adjournment. The House passed, practically without debate, a bill to carry it into effect. The Senate paid no attention to it, although a few Senators made contemptuous allusions to it, and adjourned after merely referring it to a committee. The subject therefore goes over to the next session. It all looks like a put-up job, as though there had been no intention or expectation of doing anything except to present the appearance of taking an interest in the question of currency reform. The text of the message shows that it is only a languid interest at best. Indeed, the message is at cross-purposes with itself. It says that "the soundness of our currency is nowhere questioned." If that is true, what is a currency commission wanted for? They that are whole need no physician, but they that are sick. The sole and only reason why an amendment is needed is because the soundness of the currency is questioned —because every condition which has made it an object of apprehension and terror in the past exists to-day so far as its own constitution goes—because any untoward event in the commercial world may bring on the same spasms that were experienced in 1893-'94-'95. If nobody questions the soundness of the currency, Congress was justified in adjourning without taking any action on the message, and Senator Aldrich was justified in the sneering remarks attributed to him regarding it.

We believe, nevertheless, that the President was entirely sincere in sending the message, and that when he said that the soundness of the currency is nowhere questioned he meant its soundness to-day, or for some short period while the gold reserve lasts. We believe, too, that if he had a little more firmness, or if the pesky Congressmen had let him alone, he would have sent in the message much earlier, so that at least a debate might have been had on it sufficient to start a similar discussion in the country. All the advantages that might have been reaped from such a debate will now be lost, and the course of the Administration in reference to the subject will be exposed to something like ridicule. At all events the Bryanites will say that all the talk about the need of currency reform is insincere, and they will point to the message, and the time and manner of its reception by Congress, as a fizzle.

Of course, the matter cannot be allowed to rest here. Something must be done to rescue the Administration, if not the currency, from the present trouble. We read in the papers that Mr. H. H. Hanna is about to call his committee together to put in train the steps that were indicated by the resolution of the Indianapolis convention. That resolution required the appointment of a commission similar to the one recommended by President McKinley in the event that Congress should fail to appoint one. We read in the papers, also, that Secretary Gage will be prepared to recommend a plan of his own when Congress meets in regular session, and this, we have reason to believe, is true. As both the Secretary and the Indianapolis people are working to the same end, it is obvious that they ought not to work at cross purposes. Harmony among the friends of sound money is indispensable. They will have hard enough work to carry any plan. Two different plans would work the ruin of both. Therefore, Mr. Hanna's committee, in our judgment, ought to take no step that does not meet the full concurrence of the Secretary.

So much time has been lost by waiting and so much influence squandered by dabbling with international bimetallism, that the chances are against any action whatever on the part of Congress. If the country is fairly prosperous, as now seems probable, thanks to large crops and good prices, the pressure to do something in the way of currency reform will be removed. Congressmen will say things are going right; why disturb them? Most of them will be deaf to the suggestion that trouble will come at some future time. The future does not concern the Congressman of to-day. The primaries of the present, not those of the future, renominate him. Present dangers, not future ones, are those which have influence with him. There is one possible danger, however, which may bring Congress to a realizing sense of the situation. If the revenues of the next two years are not equal to the expenditures, a currency crisis will supervene, even if times are good. The Treasury subsists on its income. If this is not equal to the outgo, the deficiency must come out of the reserve, and, when this begins to decline, the gold will begin to disappear. Then, if not before, there will be a fresh commotion about the currency and a fresh agitation for its amendment.

THE NEW TARIFF AND THE REVENUE.

The Dingley tariff bill is a fresh instance of the recklessness with which the problem of the exchequer is handled by American statesmen. On no point has the party now in power insisted more strenuously than on the need of a substantial surplus revenue. The Republican leaders have not confined their argument to exposition of the general inconvenience of a Treasury deficit; they have reasoned with much force that the currency disturbances of the past few years, the drain on the Government's gold reserve, and the consequent uneasiness in the financial markets, arose directly from the heavy shortage in the revenue. Spokesmen of the majority party have, in fact, not stopped with explanations of what the party ought to do for a surplus revenue, or even with promises of what it would do; they have publicly threatened the party in case it failed to do what was necessary. "The committee," said Senator Aldrich, on May 26, introducing the Senate bill, "believe it to be the imperative duty of Congress to provide in the measure under consideration for a revenue which will certainly meet the requirements of the Government for the next fiscal year. The adoption of a revenue bill which should fail in this purpose, and which should create an additional deficiency in the immediate future, . . . would certainly be fatal to the hopes of future success of any political party responsible for such legislation."

This is strong language; yet, in the face of this warning by the Republican leader of the Senate, Congress has passed a revenue measure from which every trustworthy expert anticipates a deficit. We do not of course include among the expert estimates Mr. Dingley's ridiculous claim that customs revenue, under

his bill, would increase $113,479,793 over the revenue of 1896. Senator Aldrich, the best authority among the Republicans, has sufficiently punctured that pretended calculation, and has shown conclusively that Mr. Dingley made no allowances for decrease in importations as a result of increased duties. In other words, Mr. Dingley framed a bill to exclude foreign products, and then calmly proceeded to reckon a customs revenue based on precisely the same volume of dutiable imports as came in before the duties were advanced. We may safely leave his absurdities to the mercy of the Republican experts in the Senate.

Mr. Aldrich calculated from the Senate bill, which was very nearly as large a revenue-producer as the Dingley measure, a deficit of $29,175,000 for the current fiscal year. To avert such deficit, he made an urgent plea for a new revenue duty on tea and an internal tax on beer, both taxes to stand only until 1900. With these additional taxes, the yield of which is easy to compute, he estimated a narrow surplus of $2,725,028, and supplemented this estimate with the solemn warning which we have quoted. The Senate immediately rejected all the proposed new revenue taxes, and the conference committee framed the bill without them. Finally, a thorough estimate was made by the Senate experts and the Bureau of Statistics, based, not on the importations of a single year, but on the average of the last six years, and making full allowance for the anticipatory importations before the bill should pass.

This estimate, as revised, figures out $169,000,000 customs revenue for the current fiscal year, or $16,000,000 less than the customs yield for the fiscal year ending June 30, 1897. Now let it be considered that the appropriations made in the last Congress, and approved in the present session, for the same fiscal year, run $14,237,836 over the appropriations for the fiscal year 1897. Let it be noticed, also, that in the fiscal year just closed there was a deficit of $18,623,108, and it is easy to see what Senator Aldrich had in mind in his warning speech of May 26.

It is always possible that a year of sudden trade revival—especially when such revival takes the form of increased demand for European goods—will raise the revenue above conservative estimates. But this is only a contingent possibility, and is therefore a factor which no maker of Government estimates has a right to take into account. Moreover, the whole history of our Treasury is a warning against optimistic estimates. We append a short table showing the successive December estimates of the Treasury for the revenue of the fiscal year then current, and comparing these estimates with actual results. The fiscal year 1897 is omitted, because its estimate, of course, made no account of the abnormal anticipative customs revenue since last February:

Fiscal year.	Estimated.	Actual.
1896	$431,907,407	$409,475,408
1895	424,427,748	390,373,203
1894	430,121,365	372,802,498
1893	463,336,350	461,716,561
1892	433,000,000	425,868,260

It must be kept in mind that, when these estimates were framed, one-half of the twelve months which they covered had already submitted their returns of revenue. When we come to estimates drawn, like those of Mr. Dingley, in advance even of the passage of the revenue bill, the teaching of our history shows even more forcibly how far the wish is father to the thought. On the day when the McKinley tariff bill passed into law in 1890, Senator Aldrich himself declared: "I now estimate the aggregate annual reduction made by the bill as reported from the conference committee, at from forty-two to forty-three millions of dollars." The result showed a reduction of $52,205,620 in the fiscal year ending June 30, 1892. On July 19, 1894, the Senate finance bill, whose schedules as then reported were left virtually unchanged in conference, was estimated to insure a customs revenue of $179,251,142. In fact, the customs yield for the twelve months ending June 30, 1895, was only $152,158,617, and even in its second year of operation the yield of the tariff fell $19,000,000 below the Senate estimate.

The action of the present Congress places our Government again in the ridiculous position of a business institution which does not know how to manage its own finances. An individual who estimates his next year's income with excessive optimism, and then deliberately raises his scale of living expenses above even his income estimate, will very soon become a chronic visitor at the pawn-shops and the usurers'. A government which does the same thing cannot escape a similar fate. It is impossible that our government should hold its proper place among self-respecting financial states until it reforms completely its present demoralizing budget system.

THE NORTHERN GOLD FIELDS.

The great gold-finds on the Klondike come at a most awkward time for international or any other kind of bimetallism. Next to good crops and good trade, nothing so depresses true bimetallist lovers of their country and their kind as the discovery of fresh gold deposits. It is such an ugly fact to explain away. Japan's going over to the gold standard may plausibly be accounted for, as it was by Senator Stewart, on the ground that "Japan has been bought up." Russia's leaning towards gold has an obvious connection with Russian tyranny. But when vast new quantities of gold are found, to go into that terrible vacuum in the currency which nothing but silver was available to fill, it begins to look as if not only bankers and creditor-nations and the powers of darkness, but Providence also, were on the side of the gold-bugs.

The alleged scarcity, with diminishing production, of gold has been the leading article in the creed of honest bimetallism. For a time it could assert high geological authority in its support. The distinguished Austrian geologist, Prof. Suess, elaborately proved, only a few years ago, that the gold supplies of the earth were gradually giving out, and that no fresh finds of any consequence could be expected. This was shortly before the tremendous increase in the output of South African gold, which of itself was a shattering blow to the bimetallic argument. Now come these undoubtedly rich discoveries in this far-off corner. If they yield, as estimated, $10,000,000 a year in gold, there alone we should have an addition to the currency half as great as that made by the Sherman law of blessed memory—and they would be full-weight dollars, too, none of your fifty-cent shame-faced token-dollars.

As we say, all this is most ill-timed for international bimetallism. Senator Wolcott's smile, we venture to say, narrows perceptibly as he reads the telegrams in the London papers giving an account of the Klondike gold fields. This thing is playing scandalously into Lord Salisbury's hand. It was bad enough before. The trade and Treasury returns in England for the first quarter of the fiscal year were showing a degree of prosperity most embarrassing to bimetallic logic. The estimates of the Chancellor of the Exchequer had been surpassed by more than $6,000,000. Then there was the unpleasant news from America of good crops and high prices for them. With Nebraska and Kansas farmers paying off their mortgages by the million, how could international bimetallism be expected to make headway? When on top of all this came the authentic accounts of the great discoveries of gold on the tributaries of the Yukon, Senator Wolcott must have been tempted to exclaim with the psalmist, "Lord, how are they increased that trouble me!"

This financial and political aspect of the question is doubtless the most important and instructive for us; but it has another highly suggestive side. These gold finds are in British territory. The Klondike flows into the Yukon near the Alaskan boundary, and the gold has been discovered mainly along its course in the Northwest Territory. Yet the successful miners, the men who come home with tales of fabulous wealth attained in a few weeks, are largely American citizens. That is to say, they are "aliens," "foreign devils," allowed to go freely into British territory and

carry away its chief treasure without let or hindrance. Imagine the case reversed. Imagine the gold fields on our side of the Alaskan border, and Englishmen swarming in to despoil us. What shrieks to high heaven and appeals to Congress there would be! We should have laws in a twinkling to make all alien miners pay nine-tenths of their findings into our Treasury. We should tax them heavily to get into the territory, and not let them get out without paying the uttermost farthing. What some of our States have done in the way of legislation to make aliens smart for lending us capital and developing our resources, fairly indicates what we would do in the case supposed. This stupid English indifference to the nationality of the man extracting wealth from English soil would never be the policy of a wide-awake and paternal and strictly look-out-for-number-one American Government.

The incident throws light on the terrible "land-grabbing" propensity of England. She grabs everywhere, but she throws what she grabs open to all the world. She is well known to grab with peculiar fury when it is a question of getting a bit of gold-bearing land; that always drives her frantic. But, as the Klondike gold-finds show, she lets foreigners come and help themselves to the gold after she has grabbed it. She polices the territory acquired; she makes life and property safe there; she establishes courts; she fosters education and religion; but she gives Frenchmen, Germans, Italians, or even her dearest foes, Americans, the same rights there as Englishmen. This is a policy of incredible silliness, according to American standards. It might be justified on the theory that law and international policy are intended to promote trade and industry, and make human liberty and happiness as secure as possible; but we know that theory to be entirely mistaken. Laws exist for the purpose of discriminating against foreigners, and causing misery in foreign cities, as McKinley boasted that his tariff had done. International relations are to be so managed that every nation's hand will be against its fellow. This being the American conception, and, therefore, the true conception, the obsoleteness, the isolation, the supreme folly of the English policy are clearly proved—and that, of course, is the main thing.

OUR NATIONAL UNIVERSITY.

The address at the opening of the Clark University summer school in Worcester, Mass., the other day was delivered by Senator Hoar, who improved the occasion to make a plea for the establishment of a new educational institution in America. He recalled the fact that, in his last conversation with Agassiz, the great naturalist expressed his surprise that there was no institution in this country where a competent knowledge of international law or of the history or methods of international diplomacy was taught, and the Senator said that he supposed this to be as true now as it was then. "Where," he asked, "is an American legislator or statesman to learn anything of the mechanism of government as it exists in other countries, or, indeed, of a great deal of it as it exists in his own?"

Mr. Hoar referred to the existence of schools abroad, where what, for want of a better name, is called comparative politics is taught, which he supposed to supply in some measure this want to their pupils, and insisted that "we need such an institution in America." He proceeded thus to outline what he had in mind:

> "The cost of its foundation cannot be great. We have men who have large training in our own public life, such men as Senator Allison, or Senator Hale, or Senator Cockrell, or Senator Gorman, who might easily fit themselves to conduct such an institution. A chair in such a university would be an object of high ambition for the most eminent of our statesmen, when he should withdraw from active political life. Such a school established in America would, in my opinion, attract pupils from the whole civilized world. It would be a valuable instructor to the nations south of us, who are growing so rapidly in the art of self-government and taking their honored place in the great family of republics. Europe in such a school would have much to teach, and much also to learn."

It would be difficult to imagine a more curious illustration of blindness to existing conditions than is afforded by these remarks of Mr. Hoar. The Massachusetts Senator is airing theories which would have been timely when our government was established, but which are nothing short of absurd when brought out in 1897. The "fathers of the republic" believed that there was a science of government, that trained statesmen were requisite to its successful administration, that a new nation had much to learn both from the past and from its contemporaries in other parts of the world. The "mechanism of government," as they conceived of it, was to be learned only by careful study of our own Constitution and of the methods pursued in other nations; and a national university, where instruction of this sort should be given, would have been an institution in keeping with the times in which they lived.

Such an institution was never established, and yet we have to-day a national university in which "comparative politics" is taught. It has its seat at Washington. Its head—who is sometimes little more than a figurehead—lives in the White House. The professors give instruction in the capitol. There are branches in Harrisburg, Albany, Springfield, and dozens of other State capitals. It is in intimate association with the city halls of hundreds of municipalities. Its professors are men of the ripest knowledge and fullest experience in the science to which they have devoted themselves. While they often manifest a disposition to perform some of their experiments secretly, their work for the most part must come to the knowledge of the people. This great university, from day to day and week to week, is teaching the "mechanism of government" by object-lessons which command universal attention. No endowment for any new establishment is required, nor need Senator Gorman, or any other of "the most eminent of our statesmen," wait until he withdraws from active political life for a chance to give instruction.

Senator Hoar lamented the fact that "we encounter the trained servants of England and Germany and France, even of Turkey, with an improvised diplomacy," and that "we are expected to do in a hurry, with untrained instruments, that which foreign countries do at leisure, with the instrumentality of experienced servants, who have the best training the world can give." This is one of the defects that he would have supplied by the institution for theoretical instruction which he wants to have established. But of what use would it be to train men laboriously in the methods of diplomacy followed by the rest of the world, when the faculty of our real national university teach their pupils that this sort of thing is "played out," and that the man who never paid any attention to our foreign relations is the man best fitted to conduct them?

Senator Hoar maintained that "we want to know, for our own constant instruction and profit, in regard to every civilized nation," a long list of things which he specified, "in order that we may have for convenient reference and instruction the particulars of the legislative, executive, and judicial mechanism of all the governments of the world." But where would be the use of all this when our real national university has for its motto, "What do we care for abroad?"

"The method of enacting laws" is one of the subjects which Mr. Hoar would have Senator Gorman and other of "our most eminent statesmen," after their retirement, teach from chairs in his new institution. But they are teaching this subject a thousand times more effectively now, as professors in our real national university. What need is there for lectures as to how statesmen shall construct a tariff law for the benefit of a great nation when Jones of Nevada is showing the country the real way in which such a measure is framed by the member of the finance committee who holds the balance of power, and when Burrows of Michigan is standing out successfully for an extra duty of $1 a thousand on white pine, in order that a few rich lumbermen may pocket several million dollars a year more than they would get at the lower rate?

Senator Hoar's appeal for a new institution to teach "comparative politics" is an insult to that real national university in which such great authorities on the science of government as Gorman and Platt and Quay are the chief teachers. Moreover, his idea of an institution where the statesman emeritus gives instruction is absurd. It is only the statesman in active service who can teach effectively, because only he knows the methods of government which prevail at any given time. The retired statesman is retired because he could not "keep up with the procession." It is the "up-to-date" politician alone who understands and can expound the "mechanism of government." Our real national university, as now conducted, covers the whole field.

MADAME GEOFFRIN.—II.

PARIS, July 14, 1897.

Madame Geoffrin's salon became a centre of attraction for distinguished foreigners who lived for a while in Paris. Among them may be cited Lady Hervey, the friend of Horace Walpole, and Walpole himself. Lady Hervey gives a good portrait of Madame Geoffrin in a letter to Hume, in January, 1764. (It figures in the 'Letters of Eminent Persons Addressed to D. Hume,' 1849.) Hume himself, who was for a time Secretary of the British Embassy in Paris, became a friend and remained, after his return to England, a correspondent of Madame Geoffrin, who calls him familiarly "gros drôle" in her letters. Walpole's enthusiasm for Madame Geoffrin was of short duration; he writes to his friend Conway that he speedily became disgusted with a house where he met all the beaux-esprits and the savants, whom he found impertinent and dogmatic. It is probable that Madame du Deffand helped to change the feelings of Walpole; the two ladies were rivals, and Walpole had too much taste and refinement not to appreciate the superiority of Madame du Deffand to Madame Geoffrin. Walpole preferred what would be called nowadays the pessimism of Madame du Deffand to the robust optimism of Madame Geoffrin, and her candid admiration for all crowned heads—Russian, Austrian, or Polish.

Madame Geoffrin was a good friend, but she had singular theories about friendship. The Abbé Galiani, who had become quite a Parisian, said of her: "Madame Geoffrin has a mania for detesting unfortunate people, as she will not be made unhappy by the sight of other people's misfortunes. This arises from a fine cause: she is sensitive, she is old, she is in good health; she wishes to preserve her health and her quiet. As soon as she learns that I am happy, she will love me *à la folie*." She says of herself in a letter: "As for me, I only try to put my sensibility to sleep." Her reign in her own salon and in her circle of friends was very despotic. She had a certain way at her own table of saying, "Voilà qui est bien," which everybody understood, and which meant that she found that a discussion or a story had lasted long enough, and that she wished it to stop. One day the young Count de Coigny, at supper, entered upon a long story devoid of interest; Madame Geoffrin gave signs of impatience, and, wishing to make a diversion, asked him to carve a chicken. Her pains were lost, for he continued his monologue while drawing from his pocket a knife no longer than a penknife. This time Madame Geoffrin lost her patience. "Monsieur le Comte," said she, with her dry, distinct voice, "to succeed in this country, people must have long knives and short stories."

Madame Geoffrin seems to have been an excellent business woman. The archives of the famous glass manufacture of Saint-Gobain tell us that in 1757 the society passed through a difficult crisis, through the fault of the director. One of the partners, M. Gombault, comes one day in great trouble of mind to Madame Geoffrin. "Madame," he says, as soon as he sees her, "all is lost." Madame Geoffrin coolly opens a window on the street. "Why, sir, if all is lost, let us throw ourselves out of the window." And, as M. Gombault did not seem inclined to do so, "then," she continued, "let us dismiss the charlatans and play the cards you have. Take the best man you have, M. Deslandes." M. Gombault was struck with the advice; he appointed M. Deslandes director, and in a short time the manufacture became very prosperous.

Madame Geoffrin married her daughter to the Marquis de la Ferté-Imbault, a descendant of Marshal d'Étampes; the contract was signed on the 18th of February, 1733. The bride received a dower of twenty thousand francs a year. Madame Geoffrin engaged herself besides to "lodge and feed husband and wife, and the children to be born, as well as a valet, a maid, a coachman, and four lackeys, to pay the wages of the domestics, and to clothe them, to provide a stable for two horses." The reunion in the same house was of short duration; a year after the marriage, La Ferté was obliged to make a campaign in Italy; he came back in a consumptive condition, and died on the 26th of March, 1737, leaving a little girl seven months old. Madame de la Ferté became a widow at the age of twenty-two. She resolved to remain in her mother's house, but she had an apartment to herself. They were hardly made to live together. Walpole once saluted Madame Geoffrin with the words, "Oh, Common Sense, be seated!" Madame de la Ferté was virtuous, well behaved, but odd, eccentric, excitable. She despised the Philosophers, friends of her mother, and preferred the *gens de cour;* she moved in the highest society, and was extremely worldly. She spent the winter in Paris, and in summer made visits from château to château, to the Maurepas at Pontchartrain, the Luynes at Dampierre. She excited in the old King Stanislas Leszczynski a great friendship, and paid him a visit at Lunéville, in company with Mademoiselle de la Roche-sur-Yon, an aunt of the Prince de Conti. The King once spoke to her of his wife, who had died a year before, and of his daughter, Marie Leszczynska, the Queen of France. "They certainly were," he said, "the two most tiresome persons I ever met." He excused Louis XV. for having looked for some distraction outside of his family circle. In the Appendix to M. de Ségur's volume there are "Anecdotes of the Reign of Louis XV., from a Manuscript of Madame de la Ferté," which are partly inspired by the confidences of the old King Stanislas. Madame de la Ferté had also among her friends the Abbé de Bernis, who became Cardinal de Bernis, a favorite of Madame de Pompadour and a minister.

Madame Geoffrin counted among the persons with whom she was in correspondence Kaunitz, the Austrian Prime Minister; she was acquainted with Gustavus III., King of Sweden. The archives of St. Petersburg preserve the letters addressed to her by the Empress Catherine of Russia; her letters to the Empress have so far never been found. This correspondence, very active for a time, ceased when Madame Geoffrin imprudently allowed Rulhière to read his 'Anecdotes on the Revolution in Russia' in her salon. Rulhière was secretary to the Baron de Breteuil, Minister of France at St. Petersburg, at the time when Catherine had become Empress, and he was able to give details on the drama of July, 1762. Catherine was informed of this reading by several persons, and did not forgive Madame Geoffrin.

The great event in Mme. Geoffrin's life was her connection with Stanislas Auguste Poniatowski. She had previously known his father. The young Prince brought her a letter of recommendation when he made his first visit to Paris. He was twenty-one years old and handsome. Mme. Geoffrin undertook to protect him from the dangers of Paris; he called her Mamma, and conceived for her a truly filial affection. After his return to Poland, he was appointed, at the age of twenty-five, Ambassador to St. Petersburg, and inspired the Grand Duchess Catherine with a violent passion; she succeeded in placing him afterwards on the throne of Poland. Immediately upon his accession (September 9, 1764), he announced the news to Mme. Geoffrin: "Mamma, your son is King." There is another version: "My dear Mamma, I am King; don't scold me." Mme. Geoffrin was quite intoxicated by this success of her "adopted son." She writes the most hyperbolic letters, she sees in Stanislas a new Henri IV., a new Sully. "My dear son, my dear King, my dear Stanislas Auguste, I adore and embrace you. . . . I really think that I should die with joy if I embraced you. My son, my King! where is the person who can speak thus? I alone!" She began to take an ardent interest in the affairs of Poland. It was no longer enough for her to rule in a little court of artists and writers. In France, she was well aware, her bourgeois condition did not allow her to take any part in the affairs of state. Her attempts in politics with Catherine of Russia had not been successful. Could she not hope to have some influence with a young prince of only thirty years, whom she had known and formed, who had confided everything to her, who called her his mother?

The Duke de Choiseul had not seen without displeasure the election of Stanislas Auguste, which had been accomplished through the combined influences of the cabinets of Berlin and St. Petersburg. The Dauphine of France, Marie Josèphe de Saxe, was the daughter of Augustus III., who had been King of Poland before Stanislas, and the cabinet of Versailles considered the new election a defeat for the house of Saxony, with which it was allied. The new king invited Madame Geoffrin to come to Poland, and, after some hesitation, she determined to make a journey which at that time was not an easy one. Shall she go through Berlin or through Vienna? It becomes an important question. Grimm recommends Berlin, where she will be received with open arms by the Great Frederick, but she does not approve of Frederick. She sees in him "neither a

virtuous nor a great man. . . . In fifty years people will no longer speak of him"—a prediction which can be placed beside Madame de Sévigné's prediction on the subject of Racine: "Le goût en passera, comme du café." She herself decided in favor of Vienna. She started on May 21, 1766, in a great berlin, which had been planned and prepared for a whole year. In Vienna she received many attentions from Kaunitz, and was presented to Maria-Theresa at Schönbrunn, where she saw and admired the Archduchess Marie-Antoinette, who was twelve years old.

The visit to Warsaw did not end as well as it began. The King was full of attentions and as affectionate as in past times; but when Madame Geoffrin undertook to meddle with the politics of the country and to give advice, she soon met with opposition on all sides, and was made to understand that she was but a foreigner. She was, besides, very painfully impressed by the real barbarism, which was ill concealed by a glittering and meddlesome aristocracy, by the condition of the people, of the peasants, who were still in a state of slavery. Altogether, the atmosphere of Poland was not the atmosphere of civilized Paris. We know little or nothing of what really passed between the King and her. The shell of friendship was not broken; they both showed much discretion; but the fact is that, after a sojourn of only three months, Madame Geoffrin returned to France, and that all her friends were struck by the uncontrollable joy she showed on finding herself again among her natural surroundings. Her dream of ambition, if she had had any, was gone, and for ever; she lived now only for her friends and for her daughter. She had an apoplectic stroke in 1776, recovered, and lived about a year more; a new crisis, on the 6th of October, 1777, ended her life. She was buried at St. Roch, in the early morning, without any pomp. She left her fortune to her daughter and a number of legacies to her friends—the most important to D'Alembert, Thomas, and the Abbé Morellet.

THE SCHOOLS OF ARCHÆOLOGY AT ATHENS.—III.

THE AMERICAN SCHOOL OF CLASSICAL STUDIES.*

In April, 1879, certain scholars who were interested in the promotion of the study of classical archæology in America, issued a circular in which announcement was made of a proposition to establish a society for the purpose of furthering and directing archæological investigation and research. The circular also set forth in general terms the objects contemplated and the methods of procedure suggested by the promoters of the undertaking. The proposed institution was to promote and direct archæological investigation and research in a variety of ways: by sending out expeditions for special investigations, by aiding the efforts of independent explorers, by the publication of reports of the results of the expeditions which the Institute might undertake or promote, and by any other means which might from time to time appear desirable. The institution thus called into being was styled the Archæological Institute of America. Its first annual report (Cambridge, 1880) contained important papers by Lewis H. Morgan, W. J. Stillman, and J. T. Clarke. At that time—only seventeen years ago—no instruction was given in archæology at any American university or college; and as one of the objects of the Institute was to promote that study, it suggested the establishment of scholarships of archæology at Harvard, Yale, Columbia, and elsewhere—scholarships similar to the then recent travelling studentship in archæology which was given by Exeter College, Oxford, to W. M. Ramsay, and has brought honor to that ancient university and renown to its holder. This appeal was not wholly unheeded by our universities, and, thanks to it, a number of young men have been enabled to study at the then unborn American School at Athens, to the lasting gain of classical scholarship in America.

But the American School at Athens, if yet unborn, was certainly *in petto*, for in the very first annual report of the Institute we read, among other things:

"France and Germany have their schools at Athens, where young scholars devote themselves, under the guidance of eminent masters, to studies and research in archæology. The results that have followed from this training have been excellent; and it is greatly to be desired, for the sake of American scholarship, that a similar American school may before long enter into honorable rivalry with those already established."

The idea of an American School at Athens, thus publicly suggested for the first time, was not to be a barren one, nor the process of incubation long. The time was ripe therefor, and the promoters of the scheme were destined to see their ambition fulfilled, at least in part, sooner than they had expected, for at the annual meeting on May 21, 1881, a committee, of which John Williams White was chairman, was appointed to devise a plan for the creation at Athens of an American School of Classical Literature, Art, and Antiquities. This committee met on June 22, 1881, and discussed plans; progress was made, but no definite decision was reached on that occasion. At another meeting, held on November 5, 1881, it was felt that, under existing circumstances, it would not be wise to compel the students to pursue exclusively archæological studies at Athens; it was therefore determined to suggest, as the name of the proposed institution, "The American School of Classical Studies at Athens." Accordingly, as the name indicates, a student of the School may study anything that appertains to Greek linguistics, history, architecture, archæology, or antiquities. It was further suggested that the School should be established under the auspices of some of the leading universities and colleges of America, each of which was to agree to pay $250 annually for the support of the School. The money thus raised was to be applied to the rent of a suitable house, to the gradual purchase of a library, and to the general running expenses. The question of the directing head of the School presented difficulties: archæologists, properly speaking, were few, and the Director, whether archæologist or not, could not live without a salary. It was therefore further suggested that the directorship be made an annual appointment, and that the contributing colleges be requested in turn to lend one of their professors to serve as annual Director. This of course meant that his salary, or a large portion of it, should be continued to him by his college during his year of residence at Athens. These suggestions of the committee were adopted by the Archæological Institute of America, and a Director for the first year was chosen in the person of W. W. Goodwin, who opened the School on October 2, 1882, in a house built for a former Prime Minister of Greece. The house not only was large enough to accommodate the Director's family, but had besides a spacious room which was originally intended as a state ball-room, and was as though specially designed for the purposes of the School library.

With the money at the disposal of the Director the house was furnished, and the library was begun with 400 well-chosen books. Mr. Goodwin found himself the guide of eight young men—graduates in American or German universities—each of whom pursued throughout the year some definite subject of study that required considerable research and length of time for its elaboration. The results of these studies were embodied in papers many of which were deemed worthy of publication in the first volume of the Papers of the School. Besides this, at the weekly meetings of the School, papers were read by the Director, or by one of the students, the object being to discuss some important subject of Athenian topography or archæology, even though it were well known, rather than to try to write papers on subjects never before discussed. At still other weekly meetings the Director lectured on the "Agamemnon" of Æschylus and on certain parts of the history of Thucydides. Numerous excursions were made to historic sites by the members of the School, partly under the guidance of the Director, and partly in the shape of tours through distant parts of Greece, the students being their own guides.

At the close of the first year all who had been connected with the School knew that it had been successful beyond the expectations of its friends, and were convinced that it had before it a brilliant future in the history of classical education in America. To be sure, no one could fail to see that the plan of sending out an annual Director was not an ideal one as a permanent policy, seeing that the Director had to retire at the very moment when he had begun to get matters well in hand. Indeed, at the start it was announced repeatedly that the annual directorship was merely a temporary makeshift; no one ever contemplated the suicidal policy of handing over every year the management of the institution to a man who was as much a learner as any of his students; who, in the nature of the case, must lack not only that all-important local and special knowledge, but also the knowledge of the ways and means of archæological study and of conserving the time of the students, so that their efforts might be expended to the best advantage.

The annual directorship was to remain in force until the time should come when the success of the School might justify its friends in making an appeal to the public for a permanent endowment in order to the establishment of a permanent directorship. Indeed, at the meeting of the Managing Committee on November 16, 1883, a committee was appointed to report at the next regular meeting a detailed scheme for securing a permanent fund and to nominate prominent men in the chief cities of the country as a permanent committee, whose duty it should be to carry out the scheme

*The facts contained in this article have been taken from the Annual Reports of the School.

suggested by the provisional committee, and to appoint trustees to receive, hold in trust, invest, and disburse the funds collected for purposes of the School.

This provisional committee twice brought in a report that in their opinion the time for the proposed changes had not yet come; and consequently for the first six years of its existence the fortunes of the School were guided by directors sent out under an annual appointment. But in the meantime friends of archæology in Great Britain had secured from the Greek Government the gift of a building-site, and had actually built a house upon it, though as yet they had neither students, nor Director, nor money wherewith to pay the Director's salary. This fact stirred to action the friends of the School in America, and at the meeting of the committee on May 16, 1884, the question of a permanent home at Athens for the American School was discussed at length, with the final result that Mr. Tricoupis, then Prime Minister of Greece, announced that Greece, in her poverty, was ready to give our School a building-site of the value of $13,500. This more than generous gift naturally awakened enthusiasm at home, and on October 31, 1885, an appeal was made to the friends of classical learning in America for $25,000 wherewith to build for the School a worthy home in Athens. Boston responded to the call with a generous $19,000, and New York gave the rest, the sum total subscribed being $26,553.22. Trustees were appointed to hold the property of the School, and these trustees subsequently secured articles of incorporation under the laws of Massachusetts. The cost of the building was greatly diminished in various ways: Prof. W. R. Ware made the plans and the estimate of the cost of construction, thus giving of his time and energy; Mr. Trowbridge directed the erection of the building. But, besides this, the cost was diminished by direct gifts from American manufacturing houses. Thus, the doors, windows, flooring, bookcases, the entire iron staircase, the hardware for the entire house, a complete set of plumbing fittings, mantelpieces, decorative panels, grates, and fireplaces were given outright by a number of generous firms whose names cannot be mentioned here for want of space. Even the Florio-Rubattino and the Cunard steamship companies gave special rates for freight. Thanks to all these agencies, the corner-stone of the building could be laid on March 12, 1887, and the School now occupies a magnificent home, "the only completely fire-proof building in Greece," "a worthy and enduring monument of the interest in Greek studies which is felt in America, and the visible evidence of our desire that no means shall be lacking for their successful promotion."

As has been said, the supporters of the School had all along intended that the management of the School should ultimately be under the direction of a permanent head, and so, on November 19, 1886, the committee took two important steps: they "determined that an organized effort should be made to secure for the School a permanent endowment of $100,000," and they invited Dr. Charles Waldstein of New York, then reader of archæology in the University of Cambridge, England, "to become the permanent Director of the School when the endowment should be secured," with the expectation that he would take charge of the School in the autumn of 1888. This latter expectation was realized, though to this day the entire sum needed for the permanent endowment has not been secured. But with the advent of the permanent Director the annual directorship did not cease; it had been found to be both unique and wise. The spectacle of a coterie of universities and colleges working together for a common end had never been witnessed before; these institutions still contributed to the support of the School, and it was but right that they should be allowed to continue to send out their professors for an educational residence in Athens.

The institution of the annual Director had never been an unmitigated evil; indeed, it had been productive of great good, for, as the aim of our School was not so much distinguished achievements as it was to arouse in American colleges a genuine interest in classical archæology in general, no better plan could have been devised than that of giving the professors of Greek in our leading colleges the untold advantage of a year's residence in Greece, whence they could not fail to return burning with enthusiasm for everything relating to Greek and Greece. Perhaps their knowledge of archæology was below par, but for all that their year in Greece made them infinitely better teachers of Greek; they had become more capable of guiding their own students not only in archæology, but in Greek literature as well, and they have ever been ready to use all their influence to send enthusiastic and well-equipped young men as students to the School at Athens. The influence of returned directors in creating an interest in archæology in America has been wonderful, as any one who has been watching archæological matters for the last fifteen years can easily see. Indeed, the feature of the annual directorship has been watched by others than Americans, by the Germans themselves. Prof. Conze, the head of the German Archæological Institute, told the writer that a study of our School had so convinced him of the immense importance of the feature in question, that he hoped to see a professor sent out annually from German universities to the German Schools at Rome and Athens.

Thus, at the end of the first six years of its existence, the School could occupy its own large and commodious building, which from first to last cost $30,000, exclusive of the ground. It had a most useful library of well-chosen books, besides scientific and photographic instruments. It had conducted excavations at Thoricus, Sicyon, and Icaria; it had published four volumes of papers, which had been accepted by the scholars of Europe and America as valuable additions to our knowledge of antiquity. But at this juncture trouble arose in regard to the permanent directorship. The friends of the School had failed to secure a permanent endowment, that having been the condition on which Dr. Waldstein had accepted the directorship. His undivided services, therefore, could not be secured, but the Managing Committee effected a temporary compromise by which Dr. Waldstein agreed to give his active services to the School during the months of December and January of each year. Under these circumstances the annual Director was an important factor in the successful management of the School, inasmuch as he was on the ground continuously, during both the absence and the presence of the Director; their work was mutually complementary. This state of affairs lasted for four years. But in November, 1891, pursuant to a resolution adopted in May of the same year, to the effect that after October 1, 1892, the School should have a permanent officer in residence at Athens during the entire school year, from October 1 to June 1, the committee elected Prof. F. B. Tarbell to be the chief executive of the School, with the title of Secretary, for a term of five years, beginning on October 1, 1892. After one year's service, Mr. Tarbell resigned, to accept a professorship in the University of Chicago; he was succeeded by the present Director, R. B. Richardson. At the same time, Dr. Waldstein was elected professor of ancient art. The feature of the annual directorship was retained, with a change of title, Prof. J. R. Wheeler being the first incumbent of the "Professorship of the Greek Language and Literature." His duties were confined to the department of instruction, for henceforth the responsibility and care of administration fell upon the shoulders of the permanent Director.

The value of the School property in Athens is about $40,000. The amount already secured towards a permanent endowment is something more than $50,000, $100,000 being the minimum amount needed. Up to date there have been seventeen directors and annual professors of the School, representing thirteen universities and colleges. The number of students who have been connected with the School is seventy-eight. These students have won their degrees in thirty-seven different American institutions. Of this number forty-six have received higher degrees; twenty-three have received the degree of Ph.D. from American universities and nine from European universities. Fifty-four are now teachers, of whom thirty-one have the rank of professor. These teachers are distributed among twenty-three different States, and each one of them is an infectious centre of enthusiasm for Greek and Greece. The Managing Committee numbers thirty-eight men, representing twenty-five of the leading universities and colleges of America.

After a young man who proposes to make the teaching of Greek his business in life has received the book-learning necessary for his profession, no better preparation for enthusiastic and effective work can be conceived of than a residence of one or two years at the School at Athens. It is hardly worth while to point out how and why such a sojourn must needs be helpful and beneficial to every student of the classics. The intellectual possibilities in the verification and vivification of history, in the study of art and sculpture, of architecture, of vases and vase-pictures, of epigraphy, of geography, of language, of folk-lore, etc., are infinite. But the advantages are not merely intellectual: the influence on the imagination must not be lost sight of, for no true student of the past of Greece can breathe the air which *they* breathed, can see the sites made famous by *their* splendid achievements in behalf of all mankind, can live among the monuments which *those* "immortal men erected to mortal gods," can learn "the secrets of their architecture," can "study geography and history at once by exploring" the battlefields of Greece, by inspecting "her lines of communication through her mountain passes and the sites of her famous cities," and not be better, purer, larger, healthier therefor. In Greece the student will realize as he could never do so well elsewhere how immense is

the debt *we* owe to Greece. Who can look upon the mountain majesty of Parnassus or the softer charm of Helicon, with its Hippokrene and Valley of the Muses, and not understand why the Greeks were poets and artists and lovers of all things beautiful, whether intellectual or physical? Physical geography will tell him at Thebes why it was that her climate was a poor one for brains; at Sparta he will see with his eyes why no walls were needed round the martial city, and he "will understand better the discipline of Lycurgus, with its iron money and its black broth, and the hardihood of Leonidas and the men of Thermopylae."

I cannot close without mentioning another matter that just now lies close to the hearts and consciences of American scholars. It is true that our School at Athens has conducted excavations at a number of places, and has done distinguished work at the Heræum, but it has always been hampered by the lack of money wherewith to do thorough-going, clean pieces of excavating work; and such alone are satisfactory, because they alone can meet the demands of the rigid science of to-day. Slovenly, imperfect, or partial excavations may, indeed, produce valuable results for the science of antiquity, but they do not tell the whole tale, and they may leave precisely the most important things undiscovered, and thereby do infinite harm in the way of preventing other persons, better equipped with money, from undertaking excavations at places from which, as they have a right to feel, the cream has been skimmed by the first excavators. This fear, however, does not always deter men, as may be seen from the case of Thoricus, for, after we had finished our excavations there, others stepped into the breach and made most important discoveries; at Eretria, too, we excavated, with important results, and yet that much is still to be done there is quite clear from the fact that surreptitious digging was going on there last October, and, a little later on, the discovery of a bronze statue by the peasants of Eretria was reported in the Athenian newspapers. We have dug at Platæa, and yet it takes a sharp eye and considerable exertion to discover those same diggings, for Platæa is still virgin soil for the excavator, and the topographical problems of the great battle are still unsolved. The best excavating we have done was that by Dr. Waldstein at the Heræum. We have now undertaken to excavate Corinth. It is a vast, almost an alarming, enterprise, and our honor is at stake—not merely the honor of our School, but the good name and fame of America as well; we *must* do a clean piece of work at Corinth, or else be ranked as incompetent sciolists. Sneers have been uttered at Athens within my hearing to the effect that after we had done playing at excavating Corinth, somebody else would have to step in and excavate the site. We *must* prove that they are ill-founded. To prove our contention, avoid the shame, and bring honor to the American name, we need a pile of money. We have already dug a series of trenches at Corinth, enough to show the vastness of the work we have undertaken to do. We know that ancient Corinth covers a great area, and that it lies deeply buried beneath the soil, the depth of superincumbent earth varying from twenty feet or less to nearly forty feet, it may be. We must buy the site and excavate it remorselessly, and *to a finish*. No trenches, no mere series of trenches, will avail, for trenches have the persistent habit of just missing the most important matters; the entire soil must be removed to a distance from the ancient site, and railways must be built for the purpose; the work must not be done by piecemeal, but consecutively; a corps of archæologists, engineers, and architects must be on the ground continuously, in order to carry on the work with vigor during all the seasons that are available for work. Now that we have put our hand to the plough, we dare not turn back.

There are thousands on thousands of Americans who could give the entire sum needed and never miss it. It is an easy way, too, for a man, or for men, to gain more than ephemeral fame, and, besides the fame, they will gain the undying gratitude of thousands of scholars not only in America, but throughout the whole enlightened world. And while generous-hearted Americans of wealth are putting their hands in their pockets for the excavation of Corinth, let them not forget the American School at Athens; let them go just a little deeper and give something considerable to the School itself, that its permanent endowment may be completed.

Correspondence.

SOUND-MONEY DEMOCRACY IN MICHIGAN.

To the Editor of The Nation:

Sir: In your issue of July 22, speaking of the Louisville Democratic Convention, you refer to the result of the Sound-Money Democratic vote in Michigan at the recent April election, and say "that a few men on the State committee, contrary to the advice of the party leaders, decided to make a separate nomination for Judge of the Supreme Court merely to keep up the appearance of an organization." The error of this statement may not be important, but it is nevertheless considerable. The committee certainly favored making a nomination, though it did not decide to make one, but called a mass convention at Grand Rapids to consider the propriety of nominating a full State ticket—a Justice of the Supreme Court and two Regents of the University. For some days before the meeting of that convention free-silver organs argued against the propriety of its making any nominations, and, before the hour fixed for the meeting of the convention, it was discovered that some delegates doubted the propriety of proceeding to a nomination. An informal meeting of as many of the delegates as could be assembled was held early on the morning of the day the convention met, at which there was a free discussion of the question, resulting in a nearly unanimous determination to nominate a full ticket—so nearly so, that when the convention assembled it proceeded to make its nominations as if the question of not doing so had never been raised.

The vote polled was hardly a surprise to the Sound-Money Democrats, though wholly unexpected by the silverites and not overpleasing or assuring to the Republicans. Not the slightest effort was made to get out the Democratic vote, and it is believed by those in position to judge correctly that the Sound-Money Democratic vote for McKinley was nearly double the vote polled at the April election for the real Democratic ticket.

One feature of that vote has not received the attention its importance justifies. For two months (or more, perhaps) before the election last fall, noon Sound-Money Democratic meetings were held daily in Detroit, and were largely attended. They seem to have produced but little effect on the result of that election, but this spring, Yaple, the Silver candidate for Justice, received in Detroit a vote of only 7,960, while Foote, the Sound-Money Democratic candidate, received 6,864. Nor was this vote peculiar to these candidates. It clearly appeared that the midsummer education of the voters was not lost, though under the pressure of strong fear of Bryanism, the voters did violence to their feelings upon other questions and voted for McKinley; while at the April election they felt free to vote in accordance with their views as Sound-Money Democrats, nearly as much opposed to McKinleyism as to Bryanism. F.

Saginaw, Mich., July 23, 1897.

THE PARTY AND THE NAME.

To the Editor of The Nation:

Sir: With many other readers of the *Nation* I feel a warm sympathy for the principles outlined in your article suggesting issues without a party. The country surely and sorely needs sound currency, sound civil service, and sound tariff legislation. By "sound" I take it that we mean something conceived in sincerity and carried out honestly and rationally.

Cannot some one offer a name around which "the new party" may crystallize? "National Democrats" is a worthy name, but would it not be better to find a title free from either of the old party names? Human prejudice (and particularly political prejudice) is influenced often by apparently trivial things. Perhaps a happy name would do much to forward the success of the principles we consider so vital.

Respectfully yours,

Warren French Sheldon.

Auburn, Maine, July 20, 1897.

HATRED OF ENGLAND.

To the Editor of The Nation:

Sir: Many reasons have been given to explain the dislike and prejudice which some Americans have against England and Englishmen, and some of the explanations given have been quite complicated and ingenious. Now I, an Englishman, have lived for two years in this country, during which time I have dispassionately and patiently studied this dislike and prejudice, and have at length discovered its cause, which is very simple and commonplace, and is all summed up in one little word, and that word is ENVY.—Yours truly, P. J. J.

Chicago, July 19, 1897.

[A longer residence will, we are sure, convince our correspondent that Americans are right in discerning more causes than one for the hatred in question. That the jealousy of rivalry enters in, there can be no doubt.—Ed. Nation.]

WOMEN STUDENTS WELCOMED AT MARBURG.

To the Editor of The Nation:

Sir: The following extract from a letter addressed to me by Prof. W. Vietor, in Marburg, under date of July 1, may be of interest to your readers, who, like myself, were agreeably surprised by Miss Anna Maude Bowen's article in your issue of July 1:

"Dem Besuch der Vorlesungen an unserer Universität durch Damen steht von Seiten der Universität Nichts im Wege sofern die Betreffenden genügende Vorbildung nachweisen. Ich selbst, wie die meisten Professoren der Fakultät, lasse Damen sehr gern als Hörerinnen zu und würde mich freuen Miss —— als solche zu Anfang des Wintersemesters hier begrüssen zu können. Seit dem Sommer 1895 besuchen Damen thatsächlich hier Vorlesungen. Die *erste*, Fräulein —— aus ——, kam durch *mich* hierher und hörte bei *mir*, worauf ich mir, wie Sie sehen, etwas einbilde." Henry Senger.

University of California, July 15, 1897.

A PROFESSOR OF THE CLASSICS.

To the Editor of The Nation:

Sir: A college in which the writer is interested has been engaged for a series of months in the quest for a professor of classics. During the canvass a goodly number of candidates offered themselves whom we believed to be well fitted for the position, so far as scholastic preparation is concerned. In most cases they were already engaged in teaching, often at quite remote points. Usually they did not wish their present employers to be made uneasy by correspondence unless there was a definite prospect of their appointment. These are normal and inevitable conditions. It must always be difficult—but desirable—to bring together the right man and the right place when they are too far apart to know each other; and, of course, the man now employed and valued where he is, is generally the one wanted elsewhere.

A large number of our candidates had taken the highest degree at some great university, and were cordially endorsed by their former teachers, fellow-pupils, and clergymen. It was therefore impossible to make any intelligent choice by such criteria alone. It soon became painfully evident that many men of advanced special scholarship are now holding positions, and drawing salaries, not at all proportionate to their prolonged and costly preparation. A few men, with whom we corresponded more or less, were confident that their eminent capacity and success in teaching would be evident to any one who should visit their class-room. This may well have been true; but it could not be tested. A larger number felt that the degree of Ph.D. itself created an overwhelming presumption in their favor; but we could take only one of the many doctors. Nearly all supposed that letters of general eulogy on their character and scholarship were effective ammunition with which to storm the appointing powers. Unluckily, it is notorious that most employers will give glowing letters cheerfully to teachers whom they are eager to get rid of, or even to men they have actually dismissed! We were favorably impressed by one correspondent when he wrote, "I have no testimonials, because I don't think them worth the getting." Of course, that is not absolutely true. Indeed, the emphatic written statements of men we knew, had decisive weight at last in this very case. Still, many imposing stacks of such letters are not worth the stationery used.

At this point the question was usually raised, "What thesis, essay, sketch for a lecture, what bit of printed or written matter can you send us, to give us an idea of your individual tastes, methods, or theories?" In the overwhelming majority of cases the answer was "None"! Often the inquiry seemed to be considered an unreasonable criticism. The thesis subject, it was stated, was purely statistical, as the recurrence of some single word or phrase in certain authors. It was in process of revision, or radically inaccurate; in short, could not be seen. Nothing else was in existence.

Now, I will not, for the moment, raise the question as a test of good scholarship. Let us concede that a young man may be a mature, well-rounded master in his special field; may be fit to inspire, to encourage, and to guide younger students, and yet has never put on paper in connected form any ideas on any author, word, or topic in that entire field! The question still remains, How can he require his future employers to form any *im*pression of him, if he has given forth no *ex*pression of himself?

If the candidate were within speaking distance, we would ask him, perhaps, to give us some notion how he would introduce a class to Virgil's 'Aeneid': "What general ideas as to the poet's times, the political and artistic purpose of the epic, the original audience and its familiarity with the Trojan myth, should the children have before they attack this great poem?" Or, "What ode of Pindar would you read first, and why?" "Plan a four years' course in collegiate Latin, or Greek, with proper sequence and progressive difficulty." "Who is your favorite author, and what sort of special study have you made upon him?" That such things, and better things, should stuff the knapsack of any young veteran who has spent a long series of years in a special field, seems evident. Every normal school would have exacted such sustained self-interrogation, surely. But, as a matter of fact, our young classical scholars are bewildered, and often aggrieved, when such questions are raised. It seems worth while, therefore, to lay this inquiry before as many of them as can be reached, in the hope that it may help to clear up what seems to us a deplorable condition of things.

Our experience tempts us to raise the question, whether the classics are now being taught, and studied, in a way to contribute adequately toward the power to express thought. We always claim for Latin and Greek a central place in general culture, *because* they are indispensable to proper command of the mother-tongue. But what shall our preaching avail if we ourselves be castaways? If there be a corporal's guard among our younger specialists in classics who can give a readable account of their favorite authors and their works, setting forth their value to the general life of civilized man, it is not easy to discover those youths. Our periodical literature contains hardly an essay per year from any younger Humanist than B. I. Wheeler or Paul Shorey. "These things ought not so to be." No range of costly, highly specialized research will be cheerfully supported from age to age by the general community, which offers *no* interesting results in forms widely intelligible to thoughtful educated men and women.

The life of classical scholarship itself, then, and the career of the individual, both depend, and should depend, on his making some attempt to show that he has a healthy intellectual life, and that it is fed and strengthened by the studies to which he devotes himself. The questions raised here have many wide ramifications. The endeavor has been rather to limit than to expatiate upon them. It is sometimes a duty to advertise an individual experience in the interest of many. Prexie.

A ROMAN HOUSE IN FLORENCE.

To the Editor of The Nation:

Sir: While making a large drain on the southern side of the Baptistery of San Giovanni, the workmen came upon Roman buildings about two feet below the level of the Piazza. These evidently belonged to poor people and were of a late period. But under these again have been found the remains of a Roman house with a fine impluvium, the sandstone cornice being quite perfect. Prof. Milani, the very able and enthusiastic director of the Etruscan Museum of Florence, was immediately on the spot, and, under his guidance, as much of the house as is possible is now being laid bare, and will be removed to the courtyard of the Etruscan Museum, where the Professor is gradually collecting all the relics of ancient Florence. I say "as much as is possible," because the peristylium, with its annexes, is under the Baptistery. Only an angle of the tablinum can be seen. This discovery does away with the old tradition that San Giovanni was once a temple of Jupiter.

Evidently the house belonged to a wealthy citizen; it resembles the well-known house of Pansa at Pompeii. The entrance is to the south, but, unfortunately, in old days the vestibulum was destroyed by a large drain, which emitted the foulest odors when broken into and was full of black mud. The atrium is 10 metres 54 cent. long and 8 metres 18 cent. wide, smoothly paved with a composition made of Arno breccia and alabaster. The same pavement occurs in the wings of the tablinum and in the cubicula, or bedrooms, of which there are three on either side. A room to the left of the tablinum has a floor of plaster made of pounded tiles and mortar, with small cubes of dark marble dotted about in pretty pattern. Of this only one corner can be seen; the rest lies hidden under the Baptistery.

A small coin of Honorius was found on the sill of a doorway of the later and poorer buildings which were erected over the Roman house. These tabernæ were probably destroyed when San Giovanni was built, as in its foundations, laid bare where they cross the tablinum, are stones exactly like those which cut the Roman house in every sense. Only one inscription has as yet been found in the excavations, perhaps the names of the owners of the house: "V (iri) I (llustres) SEX Gabinius et...." The writing is of the second century. Janet Ross.

Poggio Gherardo, Via Settignanese, Florence, July 11, 1897.

Notes.

The *Century Magazine* offers prizes to college graduates (A.B.) in the United

States of the present and of the three ensuing years, of $250 each, (1) for the best metrical writing of not fewer than fifty lines; (2) for the best essay in biography, history, or literary criticism within the limits of 4,000 to 8,000 words; (3) for the best story in the same space limit. The type-written MS. must be sent to the editor of the magazine, marked without and within "For the College Competition," signed with a pen name, and accompanied by a sealed envelope containing the writer's true name, on or before June 1 of the year succeeding graduation. The right to print the prize manuscripts without further payment is reserved, but the copyright will revert in three months to the respective authors.

The corporation of Bristol, England, have arranged with Mr. Francis B. Bickley of the British Museum to calendar their records. Students of the history of English colonization in America will be more particularly interested in those documents that relate to the Company of Merchant Adventurers. It will, however, be some time before these are reached. As Mr. Bickley reads ancient writings with facility, whether in Latin or in English, he is specially qualified for the work he is engaged upon.

Signora Bompiani's 'Short History of the Italian Waldenses' (New York: A. S. Barnes & Co.) is one of the superfluous books inspired by sympathy and imperfect knowledge. The story of the persecutions of the valleys of Dauphiné and Savoy and in Calabria can never lose its interest; but so much has been done in modern times to elucidate it that there is no excuse for the reiteration of the old fables which identify the Waldenses with Vigilantius and the Leonistæ, which claim Claudius of Turin as a member of the sect, and assign the date of 1100 to the *Nobla Leyczon*. Still worse is the assumption that the Manichæan Albigenses were brothers in faith as well as in suffering. The volume is rendered attractive by a number of photogravures of landscapes and portraits.

Two recent educational works, 'Chapters on the Aims and Practice of Teaching,' edited by Frederic Spencer (Cambridge, Eng.: University Press; New York: Macmillan), and 'An Experiment in Education,' by Mary R. Alling-Aber (Harpers), will be found suggestive, the former by instructors in secondary schools, the latter by all who are interested in the education of young children. In the English book the pedagogy of various branches of study is discussed by teachers of prominence. The first two chapters of 'An Experiment' are reprinted from the *Popular Science Monthly* for 1892. The function of either work, it should be added, would have been a more important one had they appeared before the reports of the Committees of Ten and of Fifteen proved such a powerful stimulus to educational thought among all classes of American teachers.

Mr. Stuart Henry's dainty volume, 'Hours with Famous Parisians' (Chicago: Way & Williams), contains more than a score of sketches, several of which have appeared before in English and American periodicals. The brevity of some of them suggests that a five minutes' visit might have sufficed to furnish the writer with all the points with which he favors us concerning his subjects. The celebrity of those subjects, and the vivacious report of their somewhat indiscreet visitor, make the little book entertaining reading.

A new supplement, covering the years 1879-1896, has appeared to Mr. J. B. Mayor's 'Guide to the Choice of Classical Books' (London: D. Nutt). It is particularly interesting to American and English scholars, and ought to be enlightening to Germans, because in it are noted many good books which have never appeared in the German bibliographical lists, which are so universally used. Attention should also be called to the preface, wherein Mr. Mayor offers some excellent food for thought, pointing towards improvements in the classical curriculum.

In 'Cicero and His Friends' (Putnams), a translation of Gaston Boissier's well-known work, Mr. A. D. Jones has been far more successful than his predecessors, who have recently attempted versions of other classical books by the same French scholar and academician. He has even put us under further obligation by adding a table of contents and an index. In its English form the book is fit to fill a real want, showing forth Cicero as a man, not as a contriver of syntactical puzzles, nor as a provider of convenient texts for dissertations on Roman antiquities. For parallel reading along with the orations, it is excellently adapted to use in classical schools, and may be recommended to all teachers and students of Cicero.

'The Christian Monuments of Rome' forms the first part of a 'Handbook to Christian and Ecclesiastical Rome' now in course of compilation by H. M. and M. A. R. T. (Macmillan). The other three parts will treat of the Liturgy, Monasticism, and things ecclesiastical. The present volume contains an introduction on the origin of the Church in Rome, and on the development of church buildings and the details of their interiors. Then follow brief accounts of the 350-odd Roman churches, their foundings and principal contents; and the book ends with a description of the Catacombs. It is well made, and travellers will find in it a useful supplement to Baedeker or Murray.

Luigi Borsari's 'Topografia di Roma' (Milan: Hoepli; New York: Lemcke & Buechner) is a neat little guide, small enough to be carried about in the pocket without betraying its presence by an unseemly bulge. Besides the ordinary information collected in such books, it provides references to larger works in which those who care to pursue the history of an antiquity will find it described in more detail.

Mr. Paul Leicester Ford makes, in the closing number of the second volume of the *American Historical Review*, what may fairly be called an ingenious attempt to controvert the conclusions reached by Prof. E. G. Bourne, in the previous number, as to the authorship of the disputed numbers of the *Federalist*. Prof. Bourne replies immediately, point for point, and with a weight and conclusiveness which amply confirm his original position. It cannot be said that Mr. Ford adds nothing to the discussion, but the one new material fact he adduces—that Hamilton inserted a paragraph in No. 56 in the edition of 1788 (Mr. Bourne having followed Lodge in assuming that it was in the 1802 edition)—is made to point the other way, from Hamilton to Madison, whose consent may well have been asked and given.

The Manning and allied families are shown in a tabular pedigree and in his usual complex of wills by Mr. Henry F. Waters in the *New England Historical and Genealogical Register* for July. Mr. Waters's own stock, he shows, interlaces with the Mannings, as does that of the Whitfields.

Of the three articles in *Cosmopolis* for June devoted to Queen Victoria's Jubilee, that by Francis de Pressensé is the most elaborate and valuable. Having at his command a wide knowledge of English affairs, past and present, the writer sets forth with much originality the historical and political significance of the Victorian reign, and the universal side of the festivities then preparing. Theodor Barth, member of the Reichstag, without slighting the personal qualities of the Queen, sees a special blessing in England having been governed for sixty years by a *woman;* for a male ruler, the temptations to interfere in governmental details are greater and more numerous, and for a constitutional ruler a wise, laissez-faire principle is the most practical to adopt. Only a "gekrönter Universal-Dilettant" can have the pretension both to be a ruler and to manage everything. Sir Richard Temple does not write in as broad a spirit as either the French or the German contributor; the omission in an account of the "Reign of Queen Victoria" even of an allusion to the Prince Consort, for whom the royal widow has never laid aside her mourning, strikes one as too "intensely British."

Ernst Elster contributes to the *Rundschau* for June and July some fresh results of his long-continued investigations in the field of Heine literature. Of several letters printed here for the first time, some are of great interest. They present the character of the poet in no new light—this is not to be expected of new letters or documents of any kind. But we gather from these additional knowledge of Heine's relation to some of his contemporaries; and to learn, *e. g.*, that Humboldt interceded for him in a certain matter with the Prussian King and Minister is likely to raise the poet, be it ever so little, in the estimation of those who did not know him. Incidentally the critic, in his comments, dealt with other men of the second quarter of the century, among them the literary adventurer Wit, *genannt* Von Döring, and the fascinating figure of the youthful Ferdinand Lassalle, in whom Elster sees the originator (*geistigen Vater*) of the famous "Cassettendiebstahl" committed by two young millionaires in the interest of the unfortunate Countess Hatzfeldt.

Franklin and Marshall College, at Lancaster, Pa., can hardly be thought famous. Its elder member was founded in the above town in 1787, Franklin himself contributing to its endowment, and participating in the ceremonies of the corner-stone. The institution aimed to provide a higher education for Pennsylvania Germans. Marshall College was a foundation, in 1835, at Mercersburg, Pa., of the Reformed Church, for the supply of its ministry. Since 1852 these colleges have been united. The alumni have now published volume one of an 'Obituary Record' (Lancaster), which it is proposed to continue in parts till a second volume be fulfilled. Nine-tenths of the 219 deceased graduates here commemorated were natives of Pennsylvania and Maryland. In running over the index, the once well-known and now nearly as well-forgotten politician (ending as one of Grant's stalwart "306" in the struggle for the third term), John Cessna, alone occurs to us as having attained a national reputation.

The colonial premiers visiting England were entertained at luncheon in the committee-room of the Public Record Office, London, on the 6th of July, by Lord Esher, the Master of the Rolls, who is legally the Keeper of the Records. The Deputy Keeper, Sir Maxwell Lyte, does the less nominal part of the duties connected with the preservation of the records of the kingdom. After luncheon the party were shown over the Museum, where a number of interesting historical documents are displayed for the inspection of the public. In addition to these a number of others were brought out on the occasion of the premiers' visit. Among the latter were: (1) The Log of the *Endeavour*, Captain James Cook, 1768-9 (No. 147); (2) Journal of a voyage to Otteheita in the year 1791, by H. M. S. *Providence*, Captain William Bligh (No. 173); (3) Log of the *Resolution*, 1779, at Hawaii (No. 217); (4) Log of H. M. S. *Challenger*, 1829, possession taken of Western Australia (Captains' Journals, No. 1968); (5) Holograph letter of Captain Cook to the Admiralty, recommending certain members of the crew of the *Endeavour* for promotion, Aug., 1771 (Admiralty: Captains' Letters, C 22). Among the documents shown the following related to British North America: (1) Entry of the Canada Act, 1791 (31 George III., cap. 31) on the Parliament Roll (1270, No. 1); (2) Entry of the Act of the Union of the Provinces of Upper and Lower Canada, 1840 (3 and 4 Vic., cap, 35) on the Parliament Roll (3915, No. 14); (3) Early Treaties with Indians; (4) Account of the Fisheries at Newfoundland and return of the Fishing Fleet there, 1675 (State Papers, Colonial, 35, No. 16); (5) Original Treaty of Paris, 1763, regulating the Newfoundland Fisheries; (6) Original Peace of Versailles, 1783, limiting the same.

An Anglo-American writes to us from London on July 9: "Only one hundred librarians are coming to the Conference from America, instead of the three hundred that were originally expected. Of these about eighty have now arrived, including Mr. Justin Winsor. In addition to the hospitalities already mentioned, Sir Henry Irving has now joined in welcoming the librarians. For them he is giving a special performance of 'The Merchant of Venice' at the Lyceum on the 15th of July, when he will frank five hundred members of the Conference with seats in the boxes, stalls, and other best parts of the house."

The British Association for the Advancement of Science will meet at Toronto, Canada, on the 18th of August, under the presidency of Sir John Evans, Treasurer of the Royal Society, London. The American Association for the Advancement of Science will meet in the preceding week at Detroit, in order to enable its members subsequently to attend the meeting of the British Association. Several American scientific societies have accepted for their members the invitation to join the Association and attend its sessions, which will take place within the buildings of the University of Toronto. The honorary local secretaries for the meeting are Prof. A. B. Macallum and Messrs. B. E. Walker and J. S. Willison. The general secretaries are A. G. Vernon Harcourt and Prof. W. C. Roberts-Austen. The assistant general secretary will be, as usual, Mr. G. Griffith, the mainspring of the Association. The following will be the sections: (a) Mathematical and Physical Science: President, Prof. A. R. Forsyth; (b) Chemistry: President, Prof. W. Ramsay; (c) Geology: President, Dr. G. M. Dawson; (d) Zoölogy: President, Prof. L. C. Miall; (e) Geography: President, J. Scott Keltie, Secretary to the Royal Geographical Society, London; (f) Economic Science and Statistics: President, Prof. E. C. K. Gonner; (g) Mechanical Science: President, E. C. K. Deacon; (h) Anthropology: President, Sir W. Turner; (i) Physiology: President, Prof. Michael Foster; (k) Botany: President, Prof. H. Marshall Ward.

Prof. Hale announces that the formal dedication of the Yerkes Observatory will take place on the 1st of October next, although all details of the programme have not yet been arranged. It is hoped that some of the European scientific men who are intending to be present at the Toronto meeting of the British Association will take part in the formal inauguration. In connection with the dedicatory exercises it is planned to hold a series of informal conferences on astronomical and astrophysical subjects. The board of editors of the *Astrophysical Journal*, Profs. Hale, Keeler, Ames, Pickering, and others, will hold their fourth annual meeting at that time. In Prof. Hale's note he extends a cordial invitation to "all men of science who may be willing to honor the Observatory by their presence on this occasion."

—The geography of communications is the subject of an entertaining paper in the *Scottish Geographical Magazine* for July, by Sir Henry Tyler, the well-known railway magnate. At the outset he lays down the principle that the directions of the lines of communication—or, in other words, the dominating motives for movement—have been determined mainly by the three C's, Commerce, Conquest, and Conversion; that is, "the impulses of religion, including the resort to holy places and the propagation of creeds." He describes briefly the great trade and military routes of ancient times, ascribing to the Carthaginians the merit of being the first scientific road-builders. The longest continuous route mentioned was that from the Wall of Antoninus, with two short sea passages of forty-two and thirty-eight miles, to Jerusalem, "about 3,750 miles." With the revival of commerce at the close of the Middle Ages, "a religious order was founded in England which spread into several Continental countries, for repairing and improving roads and bridges." In the New World the Incas of Peru were admirable road-makers. "The road from Quito to Cuzco, which was some 1,500 miles long and forty feet wide, was formed with stones ten feet square, and was planted with avenues of trees, and supplied with running water. Attaining levels of 14,000 feet and more above the sea, it passed over pathless and, at certain seasons, snow-clad sierras, through leagues of rock tunnels, and across great streams and torrents, and was carried over the ravines of the Andes by masonry built up solid from their greatest depths." The bridges, on the other hand, were constructed with the frailest materials, "cables and ropes of twisted osiers and vines stretched from bank to bank, bound together and floored with bamboo or timber." Sir Henry has a hopeful word for the Panama Canal, whose completion, he believes, after a careful inspection of the works, the machinery, and the route in 1895, is "possible now on the revised scheme of the new company." He estimates that there are now in the world, in round numbers, 466,000 miles of railway open for traffic—250,000 in America,—constructed at a cost of $60,000,000,000, and 30,000 ocean-going vessels with an aggregate tonnage of 25,600,000. There are many other statistics in regard to canals, tramways, telegraph and postal work, together with facts and incidents drawn from the writer's large experience as a railway promoter and traveller. He closes with an earnest plea for freedom of communication. "In proportion to the cheapness and rapidity with which passengers and freight can be profitably conveyed and information exchanged, so is prosperity attained, civilization promoted, and knowledge increased." Then, after a protest against monopolies, censorship of the telegraph, high protection duties, and passport annoyances as "practical mistakes," he adds, "Subsidized industries, bounty-fed branches of business, and other unnatural sources of temporary prosperity only act by way of stimulus in producing artificial results, and ultimately combine against the public and private weal."

—The Brooklyn Historical Club has reprinted in a hundred copies the series of letters bearing on the relations of Thomas Jefferson and James Thomson Callender (1798-1802), compiled and edited by Worthington C. Ford, which we have from time to time commented on as they appeared in the *New England Historical and Genealogical Register*. No charity can wholly excuse Jefferson's subsidies to this scurrilous pamphleteer and journalist, with his "humble arts of insinuation"; and posterity will join in Mrs. John Adams's frank arraignment of the Virginian, in correspondence with him which concludes the pamphlet. Callender renders some service to the student in two especial particulars: in his account of Gabriel's insurrection in 1800, during the libeller's imprisonment in Richmond jail upon conviction under the Alien and Sedition Act, and his glimpses of Southern society of the period—but is it such an old story? Mr. Field, printer of the *Republican*, "was unfortunately involved about twelve months ago in a dispute, the result of which proved fatal to his antagonist; but it appeared on an examination of the unhappy transaction, before the proper tribunal, that it was in Mr. Field a justifiable act of self-defence." This was the familiar euphemism of John Shore addressing John Strode. Callender's equally sympathetic account was: "He had been publicly assaulted in the market-place by Mr. Cross, who was a much stronger man. The circle of aristocrats [Federalists], one of whom was a magistrate, stood around to enjoy the victory; nor did they once offer to interfere, until Mr. Field was forced to pull out a pistol and shoot the aggressor." Again, quoting Callender: "On Tuesday last, Randolph sent for me to the custom-house to get the money, which it seems he has received orders to pay. I did not chuse to go there *alone*, as that very forenoon the [Federal] faction had published a piece recommending me to a drubbing. So I went to General Jones. He was ready, he said, to go with me; but that the card ran in such a stile as no gentleman should answer. Another gentleman, to whom I applied, made the same observation. Upon this I held myself justified in writing Randolph to bring or send up the money." We might add that Callender's letters contain many verbal curiosities, and

that the pamphlet is altogether diverting as well as instructive.

—In his 'Valori Pubblici e Operazioni di Borsa,' one of the excellent series of manuals published by Ulrico Hoepli of Milan (New York: Lemcke & Buechner), Dr. F. Piccinelli has collected a vast amount of valuable information in regard to Italian securities and stock exchanges in particular, and financial affairs in general. Much of this information, especially such as relates to the currency systems of different countries, may be found in similar treatises in other languages; but the long category of Italian banks and joint-stock companies, including, as it does, a brief history of each institution, cannot be found elsewhere, and is interesting because it shows that a great number of these concerns have not only survived the financial storms of the past three years, but have continued to pay dividends to their shareholders. Some of the information about other countries is not equally up to date. We had supposed that the case of the United States currency patient was of interest to the whole race of financial doctors, and that the business of the New York Stock Exchange was on so great a scale as to make it important to the financial world. But the most recent information Dr. Piccinelli gives as to our currency situation is that in 1892 a committee of the Senate reported favorably a free-coinage bill, while New York is omitted from a list of foreign stock exchanges which includes Buenos Ayres! In his preface the learned Doctor expresses the hope that the knowledge diffused by this manual may have the effect of restricting the financial disasters "che hanno contristato e contristano l'Italia nostra." But it is to be feared that this hope is illusory, for it has been invariably found that financial disasters are caused by the weakness, the greed, or the dishonesty of individuals, rather than by their ignorance of the science of economics. Of a similarly delusive character is the wisdom supposed to be contained in a collection of rules for the guidance of operators on the stock exchange. In these we are informed that "gran parte della scienza di Borsa si riduce a questa proposizione: essere bene informati." The experience of the Anglo-Saxon speculator, on the other hand, makes him suspicious of all information, and finds expression in the proverbial "Early information and bank accommodation will ruin any man." But if there be any who believe that success in speculation can be achieved by following printed directions, they will find an abundance of such guidance in this handy volume, which is written in the most pellucid Italian.

—Pitrè's 'Biblioteca delle Tradizioni Popolari Siciliane,' lately noticed by us, will always be the storehouse of individual facts from which may be constructed connected accounts of the Sicilian people in their various activities. Such a picture of the Sicilian peasant has just been drawn by an independent observer, next to Pitrè, perhaps, the one most familiar from his own observations with the manners and customs of Sicily. The work is entitled 'Costumi ed Usanze dei Contadini di Sicilia, delineati da Salvatore Salomone-Marino' (Palermo: Sandron). This most interesting and valuable work is practically a compend of Pitrè's twenty volumes. In it the life of the Sicilian peasant is given from the cradle to the grave, in twenty-seven chapters, in which are described such topics as the peasant's family and house, his day's work; how he spends his evenings; seed-time and harvest, Sunday, festivals, weddings, dress, etc. An appendix contains various compositions by poets of the people descriptive of peasant life in the first half of this century—a life which, Signor Salomone-Marino says, is rapidly changing under the influence of the new order of things in Italy. The author says: "I speak of the peasants of the old stamp, whose generation is already declining and in a few years will be sought in vain. The new peasants do not concern us: the unavoidable conscription returns them to us more learned, polite, and quick, but at the same time with a burden of ambitious, crude, and corrupt ideas which will give them another type—I cannot yet say what, but certainly far removed from the traditional one of their native island, and perhaps not so good." It is for this reason that works like Pitrè's and Salomone-Marino's have such inestimable value. The type is changing rapidly all over Italy, the dialects are fast disappearing, and in a few years the popular speech and customs will have to be sought in books.

—The annual report of the Astronomer Royal to the Board of Visitors announces that a number of new instruments have been added to the permanent equipment at Greenwich, among them an alt-azimuth, and an equatorial presented by Sir Henry Thompson. Photographs of the moon and of double stars have been taken inside and outside the focus, with a view to adjustment of the object-glass; the separation between the lenses being varied, in order to correct a small outstanding aberration. A powerful battery of instruments is carried by the equatorial—no less than five large telescopes. Up to the 10th of May, 551 successful fields were obtained in the progress of photo-mapping the heavens, leaving about 600 still to complete the Greenwich allotment. Solar photographs are constantly taken, the spot activity having continued in general to decline since last year, despite two cases of temporary revival; and magnetic and weather observations are continued as in the past. Dr. David Gill, her Majesty's astronomer at the Cape, sends also to the Secretary of the Admiralty his account of the year's work. The McClean telescope fittings, walls, and dome are far advanced toward completion, as well as the machinery of the hydraulic rising floor, which promises to be an important adjunct to the convenience of the new observatory, providing an equipment for spectroscopic work long needed at the Cape. Several publications have appeared during the year. The second volume of 'A Determination of the Solar Parallax and Mass of the Moon from Observations of Iris, Victoria, and Sappho, in the years 1888 and 1889,' is ready for distribution. Two volumes of the Cape Photographic *Durchmusterung* will soon be issued, containing together the places of more than 300,000 stars. On account of the absence of H. M.'s Astronomer in England, passing works through the press, the famous heliometer has not contributed its usual quota to the work of the observatory. The useful time-service continues, signals at Greenwich mean noon being distributed by a central system of relays. All told, the degree of activity in British official astronomical circles, under the direction of able chiefs, themselves competent astronomers, is most satisfactory and reassuring.

DR. PETERS AT NIPPUR.

Nippur; or, Explorations and Adventures on the Euphrates. The Narrative of the University of Pennsylvania Expedition to Babylonia in the years 1888-1890. By John Punnett Peters, Ph.D., Sc.D., D.D., Director of the Expedition. With illustrations and maps. Vol. I., First Campaign. G. P. Putnam's Sons. Pp. xv, 375. 1897.

Nufar, Nuffar, or Niffer is the modern name of a mound lying on the old canal bed known as Shatt-en-Nil, about ninety miles south-southeast from Bagdad, and fifty miles southeast from the site of ancient Babylon. It is between the Euphrates and the Tigris—here fifty or sixty miles apart—some twenty miles from the former and over thirty from the latter at the nearest points. Its latitude is about 32° 6′ north (the parallel of Savannah, Ga.), and its longitude about 42° 50′ east. It is surrounded by swamps and the territory of jealous Arab tribes. It is difficult to reach; more difficult still to occupy for a length of time, amid hostile and greedy natives and fever-laden vapors from the marshes. Yet this mound has been reached and occupied and excavated; it has yielded priceless treasures; and the credit belongs to the expeditions sent out by the University of Pennsylvania and sustained by the generous gifts of Philadelphians.

The mound is the ruin-heap of an ancient city, once known as Nippur, famous in Babylonian history. The excavations have been conducted with system and scientific plan, like those of Schliemann at Ilium, or Petrie and Bliss at Tel el-Hesy, so as to trace the successive stages of the town's history, marked distinctly by the successive layers of débris. Not only have implements of stone and metal, jars, sarcophagi, cuneiform cylinders, and tablets in vast quantity been brought to light—the estimate of inscribed objects runs to between 30,000 and 40,000—but many of the inscriptions are of the most archaic type, and demonstrably from a remote antiquity; affording material for fruitful study into the origin of the cuneiform signs (see the *Nation* for June 17), and extending our knowledge of Babylonian civilization probably thousands of years backward. Prof. H. V. Hilprecht of Philadelphia has already edited a sufficient number of these texts to prove their invaluable character. The evidence of inscriptions is confirmed by the independent evidence of the ruin-strata. Thirty-five feet below the surface, underlying elaborate remains of building, there has been found a pavement of burnt bricks inscribed with the names of Sargon and his son Naram-Sin, who flourished 3800-3750 B. C. Below this, again, the débris extends at least thirty feet deeper, to virgin soil, with the remains of at least two temples, one superimposed upon the other, and apparently carrying back the earliest history of the city not less than 2,000 or 3,000 years further still, while midway of these lower strata a drain with a key-stone arch indicates the high degree of civilization reached by the inhabitants of Nippur, say between 5,000 and 6,000 B. C. No discoveries have been more important in helping us to conceive and picture the sweep of ancient history.

Now, it is the beginning of these discoveries which Dr. Peters sets forth in the attractive volume before us. The inception of the plan was due to him—then a professor in Philadelphia; the actual setting on foot of the enterprise, the raising of the needed money, the organization of the first party, were the result of his energy, meeting with a cordial response from large-minded friends of learning. He headed the first expedition; it was he that determined upon Nippur as the best site for beginning work, influenced in part by information courteously furnished by a German party which had looked over the ground; for two years he conducted the excavations at Nippur in person; and, but for his persistence in the face of discouragement and obstacles that seemed to others insurmountable, it is safe to say that the diggings would have ceased at the end of the first spring's work, and the greater part of the rich results afterwards secured by Dr. Peters himself in 1890, and by his successor, Dr. J. H. Haynes, in 1893-1895, would have been lost to the world, at least for many years to come. It is this fact which gives a significance even beyond its intrinsic interest to the present volume. This describes the steps which led up to the undertaking, the preliminary work, the journey to the field, and the labors of the first few months there.

The story is told with simplicity, directness, and precision. The author neither thrusts himself unduly into the foreground, nor uses self-conscious circumlocutions when the narrative requires him to mention himself. The detail is sufficient, but not excessive. The selection from abundant material is made with judgment, and the perspective is good. Personal experiences and scientific facts are skilfully combined, with a vein of genial humor underlying accounts of the former, and scholarship both ample and exact marking statements of the latter. At times there is an almost unexpected frankness, both in representing the difficulties of dealing with Turks and Arabs, and in acknowledging the mistakes of inexperience on the part of the explorers themselves. All in all, while the book has a marked individuality, it is a fit companion for the classic works of Layard and Loftus, and of itself is a credit to American learning and literary skill—pleasant to read, and well worth the reading.

No exploring party has ever gone to Babylonia with more careful equipment than this first expedition of the University of Pennsylvania. No less than four of the names are those of scholars recognized in Assyriology, Professors R. F. Harper, H. V. Hilprecht, J. P. Peters, and J. D. Prince; Mr. Haynes went as photographer and business manager, Mr. P. H. Field as architect, surveyor, and engineer, and Mr. D. Z. Noorian as interpreter. Of these Mr. Haynes and Mr. Noorian had accompanied Dr. Ward on the Wolfe expedition in 1884-1885. Great pains were taken to pave the way by diplomacy; much consultation and forethought was devoted to the outfit and every kind of preparation. The larger part of the present volume is occupied with the preliminaries and the journey. The wearisome delays occasioned by evasive Turkish officialism at Constantinople are vividly depicted. Perhaps the most entertaining incident is the authorized smuggling of the expedition's firearms from steamer to shore at Alexandretta, but the whole account of the Constantinople sojourn, and the descriptions of noteworthy characteristics of that anomalous European city, are picturesque and life-like. One is at times reminded of 'Moltke's Letters,' a book too little known outside of Germany. Among other things, Dr. Peters pays a high tribute to Hamdy Bey, the enlightened Director of the Imperial Museum at Stambul.

From Constantinople to Alexandretta the route was by sea; thenceforward in the saddle. Aleppo was the chief stopping-place between the Mediterranean and the Euphrates, and the journey along the Euphrates followed, as usual, the right bank, through Deir, Anah, and Hit. The author dwells with just satisfaction on the identification of Kal'at Dibse—a dozen miles below the first eastward bend of the Euphrates, at Barbalissus—with the Biblical Tiphsah, the Thapsacus of the Greeks and Romans. The identification is one of those happy "finds" which need only to be stated to meet with general acceptance and become the common property of scholars. (The discovery was announced by Dr. Peters at the time, in the *Nation*, May 23, 1889.) On his Euphrates journey the author makes constant but independent use of the records of Chesney's exploration, supplementing and modifying them as circumstances require, and all along the route shows himself the competent scholar, discoursing genially of matters of scholarly interest, and often of general human interest as well. The condition of the people, the possibilities of agriculture, the characteristic peculiarities of different towns and different regions all draw his attentive eye. We know of no better presentation, in a few chapters, of the state of the country, even apart from the merits of the narrative as that of a scholar's journey.

Dr. Peters makes especial acknowledgment of the marked courtesies of Major Talbot, the acting Indian Resident and British Consul-General in Bagdad, to whom the party were greatly indebted for many attentions and facilities. It is pleasant to know that formal recognition of them was subsequently made by our Government. From Bagdad on the difficulties increased. One can hardly give in a few sentences a fair idea of the hindrances put in the expedition's path by the dulness or arbitrariness of officials, the envy and rapacity of Arab tribes, submitting to the Turkish yoke only in the presence of superior force, and frankly rejecting it when they felt strong enough to do so, and not least by the pestilential climate, which reduced the whole party, and left them scarcely fit to cope with the intricate questions constantly thrust in their way.

The party had been delayed almost three months in Constantinople, awaiting the official permission to excavate. Hence, although Dr. Peters left America in June, 1888, it was the last day of January, 1889, before he reached Nippur, and digging was not begun until February 6, when thirty-two men were set to work. Only a little more than two months were spent in excavating that season, but the number of laborers was greatly increased. Under all the circumstances, although the brevity of the term and the meagreness of result of that first season's digging very naturally seemed an unfortunate contrast with the elaborateness of the preparation and the number of scholars participating, it is doubtful whether more could have been accomplished. The season was cut short by some ten days through the excitement and peril arising over the death of an Arab, shot by one of the Turkish guard while trying to steal the horses. The actual departure, made in haste and with considerable loss of property, bore, no doubt, somewhat the aspect of a retreat. There was also a general discouragement among the members of the party. Some lack of personal harmony seems hinted at in a single sentence. Most of the party formally resigned. Dr. Peters sums up the record in a gloomy paragraph:

"Our first year at Nippur had ended in failure and disaster. I had failed to win the confidence of my comrades. None of them agreed with me in my belief in the importance of Nippur and the desirability of excavating down to the foundations. The Arabs had proved treacherous. The Turkish authorities disbelieved our story of Arab treachery, and suspected us of plotting with our Turkish commissioner to carry away antiquities. I was sick and nervous, having suffered for two months almost incessantly from severe facial neuralgia and consequent sleeplessness. In fact, I was on the verge of collapse, and the world had never seemed quite so black before."

All the more must we admire the pluck which led the author to determine to prosecute the excavations at Nippur farther another season, with such rich and ample fruits. Meantime, he returned home, as the other members of the party did, with the exception of Mr. Haynes, who, fortunately for future excavation, had been made Consul at Bagdad, and Mr. Noorian, who remained with him. The second volume will contain the account of the work carried on by Dr. Peters on his return to Nippur in 1890, and will be awaited with keen interest.

The book is illustrated with photographs and drawings, and (as frontispiece) with the portrait of Mr. E. W. Clark of Philadelphia, to whom the support of the expedition was largely due. There are two maps in a pocket, one of the route along the Euphrates, and the other of Babylonia from Bagdad to Ur. As appendices we have the subscription paper of the Babylonian exploration fund of the University of Pennsylvania; the first application for permission to excavate; the irade granting the permission; the Turkish law on archæological excavations; a brief outline of the geography of the Euphrates, from ancient authorities; and last, but not least, a portion of the diary of Dr. William Hayes Ward, leader of the Wolfe expedition to Babylonia, beginning with his departure from Bagdad, January 12, 1885, and ending at Beirut in the following April. This covers nearly sixty pages, and is now published for the first time. Dr. Ward is a keen and accurate observer, and his compact record, including frequent compass notations, is of much value. His journey included Nippur, Tell Nasriyeh, and Ur-Mugheir, and on his return he passed through Palmyra. Some of the illustrations of Dr. Peters's book are from photographs taken by the Wolfe expedition.

We cannot close this review without expressing once more the debt of the whole world of scholars to the University of Pennsylvania, under whose auspices the exploration of the mound of Nippur has been carried so far, to the personal devotion of the explorers, with Dr. Peters at their head, and to the "public-spirited gentlemen of Philadelphia," to whom he dedicates his book. Money and labor have been worthily spent. It is, indeed, no new thing. No-

where on earth are private means and effort more lavishly given for education, to say nothing of benevolence, than in the United States. Expeditions have been sent eastward and westward, to Arizona and Mexico, as well as Babylonia—to Alaska and to Africa. Archæological schools are situated at Athens and at Rome, besides the great benefactions at home. It is well that it should be so. It is desirable that it should be so more and more. What Philadelphia has done at Nippur might be repeated with perhaps equal wealth of result by other American cities, in other Babylonian, Mesopotamian, and Syrian mounds. Whoever undertakes it ennobles material possessions by using them nobly—making them contribute to the intellectual and moral resources of the nation and the world.

The Ancient Volcanoes of Great Britain. By Sir Archibald Geikie. Macmillan & Co. 1897. 2 vols., royal 8vo, with 7 maps.

Southern Scotland and northern England are visited by multitudes of strangers each year, and many get as far as the Western Isles. Few of them, however, are reminded of volcanic phenomena, though columnar basalts, such as those of Fingal's cave, may sometimes suggest the thought of lava. Yet for long periods of time in the far past this region has been covered with volcanoes like Hecla, and lava sheets like those of the Snake River. Japan is not more plagued with earthquakes than England has been, and the quiet little island has had its Krakatoas. It may have them again, but there is no immediate danger.

Geological conclusions such as these, when based on an overwhelming amount of undeniable evidence, appeal strongly to the imagination; indeed, it is such appeals which call forth the spirit of research and thus create science. But it is not for the immediate purpose of stimulating the imagination that Sir Archibald Geikie's latest work is written. Volcanoes and volcanic rocks have always been attractive subjects to students of nature, "naturalists" in the good, broad sense in which Lord Kelvin uses the term. Within a generation this interest has greatly increased because of the invention of slicing even such unpromising rocks as basalt so very thin that the sections become transparent and can then be studied under the microscope, with an amount of detail not dreamed of by earlier geologists. The method seems to have been invented by Nicol, whose name is ordinarily connected with an extremely useful prism familiar to microscopists. Slicing was introduced, however, by Dr. Sorby, and the study of rocks under the microscope has been most ardently pursued on the Continent of Europe by Rosenbusch, Michel-Lévy, and their pupils.

The development of such a method of study, which could be quietly pursued at home and at ease by the contemplation and interpretation of objects which, in the polarized light ordinarily employed, exhibit most enchanting colors, naturally attracted many votaries. The consequence is that the minutest details of composition and structure of a vast number of volcanic rocks are now known to students. In fact, the quantity of detailed information is really embarrassing. Generalizations are needed to render it comprehensible; and, above all, the results of microscopic study need correlation with what may be called the life-history of volcanoes, interpreted on sound principles of natural philosophy.

Most volcanic regions do not offer very much opportunity for inquiry into the evolution of volcanoes, or into the relations which the many modifications of mineralogical and chemical composition bear to one another. In many regions the rocks are too new; only the latest ejecta are exposed. In others they are too old; the superstructure has been cut away under the action of "water dropping day by day," and only the foundations remain. It has been known to geologists that the volcanic region of England, particularly the Western Isles, presents remarkable exposures. There the accidents of topography have been such that, while the relatively recent rocks remain in sufficient quantities, the more ancient ones are also exposed, so that a complete autopsy of the dead volcanic giants is possible. It is as a contribution to this subject that Sir Archibald's book is intended. It represents the accumulated results of more than two-score years of observation and study of the history and the relations of the volcanic rocks. They are presented with all the charm of style of one of the masters of the language, and they are illustrated with a generosity worthy of the subject.

It is impracticable to convey an adequate impression of so extensive a work in a brief review, but some idea must be given of the author's attitude towards doubtful questions. One of the famous deductions of Lord Kelvin was that volcanic energy must have lessened as the age of the earth increased. Now in the volcanic area of Great Britain two periods of activity are abundantly represented. The earlier is Palæozoic, the other Tertiary, and between them intervened the vast Mesozoic age. When the earlier eruptions ceased, the first mammalian animals had not come into existence. When the second series of outbursts died away, Homo Sapiens may already (somewhere on the globe) have developed conceit enough to call himself wise. The time interval is of course immense, a very appreciable fraction of the entire age of the earth; but in Great Britain at least there is every evidence that the later eruptions were not less vigorous than the earlier ones. It does not follow, however, that vulcanicity in the world as a whole has not lessened with time, though it probably decreased more rapidly when the earth was very young than it is now doing. Lord Kelvin's inference is not impaired by the fact that the British Islands do not illustrate its truth.

It is very largely to the study of this region that we owe the generalization that the volcanic rocks of ancient periods are not essentially different from the more modern flows. The hypothesis, never very strenuously held, that there was a difference, arose in part from the changes which the vicissitudes of time have produced in the older volcanics, and partly from the fact that it is, as a rule, only the lower portions of the older rocks which remain for comparison with the superficial portions of the younger series. In Scotland, however, there are exceptional opportunities for comparison admirably described by Sir Archibald. The natural and simple conclusion is that volcanic phenomena repeat themselves as often as certain chemical and physical conditions recur, and are as independent of time as is the action of gravity.

The order of succession of eruptive rocks in a connected series of eruptions is a subject in which all students of rocks are now intensely interested. Sir Archibald finds that, as a rule, those rocks, such as peridotites and basalts, which contain a relatively small amount of silica, were the first to appear, and that the amount of silica gradually increased, so that the last eruptions were most siliceous. This is a radically different result from that reached by American geologists in the Rocky Mountain region. The succession among the British lavas, however, is not invariable, and Sir Archibald wisely concludes that the true explanation of these alternations is of a complex order. It is, indeed, by no means clear that the order of complexity is not of an insoluble degree and due in large measure to what we call accident.

Sir Archibald's treatment of the origin of rock differences is somewhat disappointing. He does not fairly face the problems involved, and contents himself for the most part with recording the evidence that allied rocks in some cases have a community of origin. He does, however, insist that the banded gabbros and gneisses are derived from heterogeneous magmas. With so large an accumulation of facts so carefully studied, he should have been able to reach more definite conclusions, even if he had been obliged to state them tentatively. His responsibility in the circumstances is not quite ended by a lucid and attractive chronicle of the phenomena, but, fortunately, Sir Archibald has time to make good this sin of omission. The question as to how far various rocks are derived from a common magma, and by what processes differences have been evolved, is not of interest to students of petrography only. It is bound up with the constitution of the earth's interior, and even with the origin of the earth itself.

'The Ancient Volcanoes of Great Britain' is a treasury of detailed facts to which geologists will long turn for examples of almost every phase of vulcanism. It is a pity it is an expensive book, for every geologist will want to own it, but it could have been cheapened only at the expense of its value.

Pictures of Russian History and Russian Literature. By Prince Serge Wolkonsky. Boston: Lamson, Wolffe & Co.

Those who were so fortunate as to hear Prince Volkonsky (this is the more accurate but less fashionable way of transliterating his name) during his visit to America in 1896 will be glad to own this permanent record of his Lowell Lectures. The personal charm of his manner is missing, but the peculiar value of the matter remains. The volume is especially valuable for people who wish to explore the subject of Russian history and literature in the critical writings of different countries, as well as in the writings of Russian authors and critics, for Prince Volkonsky gives very full lists of all the books to which he refers, with copious footnotes bearing on the text. These lists and notes, taken in connection with the remarkably clear, well-proportioned pictures of his lectures, furnish if not the best condensed and thorough work that is to be had, at least one of the best. It must not be thought that the author, though compelled, by the nature of his subject, to indulge in much compilation from other sources, contents himself with merely reporting other people's ideas.

On the contrary, the flashes of wit and insight which illumine nearly every page, added to the good judgment as to what could best be incorporated in a series of lectures necessarily of comparatively brief compass, render the book as nearly perfect as it is possible for such a book to be. It would be hard to suggest a single addition or alteration. It will prove a boon both to reading-clubs and to solitary students.

One delightful feature is, that though the author never hesitates to speak the whole truth in unmistakable terms, he does it with such tact and courtesy, as well as thoroughness, that even the victims must, perforce, acknowledge the justice of his descriptions or strictures. What can be more accurate than the gentle statement and warning (p. 7) as to what the foreigner's method is, and what he must not and must expect in the matter of Russia and her literature? He begins by quoting Prince Viazemsky: "If you want an intelligent Englishman or Frenchman to talk nonsense, let him emit an opinion on Russia; it is a subject which intoxicates him and at once clouds his intellect." People go to Russia with preconceived opinions, and are too diligently engaged in matching their assumed facts with proofs to see the real facts. He then proceeds to mention the American girl "who frankly confessed that she did not like Russian novels representing Russian life; she thought things they pictured were not original enough, lacking 'local color'; she much preferred English novels about Russia, they were so much more 'Russian'—with their snow, wolves, police agents, and the threatening prospect of Siberia in the background."

But we may safely omit further reference to details until (p. 106) we come to the subject of Peter the Great. Despite the fact that foreigners know more about Tsar Peter—on the surface—than about almost any other character in Russian history, there are, nevertheless, puzzling points about his character, career, and the influence which he still exerts, in reality and in debate, that require lucid explanation, and that lucid explanation the author furnishes. "If any one should ask us, How did he do it [that is, weld the scattered forces and impulses of the nation into a compact, vital whole]? extravagant as it may seem, we should answer with one word, 'He lived.' Peter the Great lived, and that was enough; his life was the people's life; his learning and labor were his nation's improvement; his advance was the advance of the country; his success was Russia's success." And he quotes the historian Solovieff: "Peter the Great is the last and greatest *hero*. Only Christianity and proximity to our own times have saved us (and this only to a certain extent) from a religious worshipping of this demigod, and from mythological recitals about the exploits of this Hercules. He is a hero in the antique sense; he is in modern times the only specimen of those gigantic natures of which we see so many in the misty distance of ages at the foundation and formation of human societies." From this beginning the author gradually works out the perfect portrait, reminding us that

"that sovereign, who is so much accused by the so-called national party for his propensity to foreigners, leaves the state affairs at his death exclusively in Russian hands. . . . Now we believe in him, for we have acquired that moral education which he neglected for what he considered of more urgent importance; and, enriched with that moral education, we now judge his work and approve of it. . . . During thirty-six years the country was on the go; towards the end, people began to feel tired; a sort of relaxation followed Peter's death; the workers took rest, yet the work stood firm—it cannot perish, and this is perhaps the greatest test of the enormousness of his effort, that he made it impossible for the country to turn back. Peter the Great is accused of having turned his country out of its natural course, of having trampled upon the national spirit in order to impose the foreign culture of Western Europe. . . . For his violence and cruelty, people have compared him to John the Terrible. . . . People really seem to forget of what times they speak. Read the Memoirs of the Margravine of Bayreuth, Frederick the Great's sister, you will see what was going on at her father's court in Berlin in this same eighteenth century. And what did stout Frederick William of Brandenburg do to expiate his brutalities? But as he was a brute, nobody mentions him, whereas a great man's faults are registered so as to form a regular indictment."

The lecturer then explains the Slavophil and the corresponding current of public opinion, and winds up with a warning that no one can know a country by reading about it, but only by reading its national books—with such discreet assistance and suggestion as he affords, he might have added; and that "Europe's eighteenth century is Russia's eighteenth century—it is the first coincidence of universal and Russian chronology."

The best way to show the value of the author's suggestive style is by quotations, and we therefore permit ourselves to indulge in them more at length than usual, because of the need, as evinced by the innumerable valueless compilations which leave matters as obscure as they find them. Here is a just comparison: "If you consider that over two hundred years separate the German translation of the Bible by Luther from Goethe, and that only fifty years separate the Russian Grammar by Lomonossov from Pushkin, and less than a hundred years lie between Lomonossov and Leo Tolstoi, you will get an idea of the enforced pace by which Russian thought was advancing." An interesting contribution to the question of censorship is given on p. 225. Gogol's famous play, "The Inspector," which has never been taken off the Russian stage since the Emperor Nicholas I. ordered its production intact, was pitilessly mutilated by the German manager when, after many hesitations, he accepted it for the Imperial stage in Berlin, in 1895! Slavophilism—that mysterious subject to the foreigner—is clearly set forth, after a preliminary characterization as "spread-eagleism," which is deliciously accurate in its general outlines. The manner in which the emancipation of the serfs is handled, and the setting forth of the reasons why Russia will not have the labor question to deal with for centuries to come, is another valuable contribution to current discussion.

Probably, the chapter which will awaken the most vivid interest is Lecture viii., wherein the modern writers Turgeneff, Dostoievsky, and Tolstoi are treated with the greatest enthusiasm, justice, and delicacy. Prince Volkonsky sets forth how Grigorovitch, in 'Anton the Miserable' (he might have added, 'The Fishermen,' also), not Turgeneff, as is generally believed, was the first to introduce the peasant into the novel; considers the claims which Dostoievsky possesses (and which we heartily acknowledge) to the final judgment pronounced upon him by the author—"The light left behind by Dostoievsky is one of the purest that shine on this earth; it is one of the most precious legacies bequeathed by man to future generations"; and, finally, discusses the relations in which Count L. N. Tolstoi stands to Turgeneff, Dostoievsky, society, Christianity, together with his tendencies, which are distinctly in the direction of disintegration. It is impossible to do justice by quotations to the fine analysis of Tolstoi's teachings, the clear reasoning and logical argument. We must refer our readers to the book itself for this subject, as for the many things which we have passed over unnoted, but not unappreciated. It is possible that a careful perusal of this last chapter, in particular, will help many people to understand the exact drift of the Count's doctrines, and their own attitude in respect to them.

It is a sincere pleasure to be able to give such unreserved praise to a book as we can to this one. It is no easy matter to infuse new life into formal subjects, and so to combine the history of a nation and a literature for a thousand years that the result will become a living fountain of thought and inspiration. Yet this difficult feat Prince Volkonsky has accomplished. We congratulate him and his readers.

Ricordi Tipografici di un Viaggio agli Stati Uniti (Marzo-Giugno, 1892), di Piero Barbèra. Florence: S. Landi. 1897.

This little brochure consists of reminiscences, by the present head of the famous publishing house of Barbèra in Florence, lately contributed to the *Arte della Stampa*, touching his visit to this country in 1892 with an especial eye to the state of the printer's art among us. Incidentally he has something to say as a tourist, and cannot withhold a chapter from the Boston of Franklin, whose Autobiography counted for so much in the life of his own honored father; nor from Harvard College. And if he notes the fact that railroad time-tables are freely given away in the United States, instead of being sold, as in Italy, or that our street-car conductors are not always civil, or that our newspapers are disgracefully pitchforked together and stuffed with all sorts of scandals and personalities and puerile "indiscretions," or remarks among the outlying market stalls of Faneuil Hall (which he happily styles the Jeu de Paume of the American Revolution) his fellow-Italians in colorable quantity, these are pure asides from his main purpose.

He takes his first typographic lesson in Chicago, where he investigates, at Rand, McNally & Co.'s huge establishment, the mystery of the manufacture of the railroad maps there turned out. He next describes, with the aid of many illustrations, the appointments of the Riverside Press at Cambridge. Then, with an intervening chapter on the offices of the Century Co., he very minutely and lucidly reports upon the De Vinne Press, of which his admiration is all but unqualified, and finally with good reason sketches the typographic career of Mr. De Vinne himself. Throughout, Signor Barbèra shows himself a most intelligent and exact observer, and his narrative has the charm of simplicity, cultivation, and humor. To any one practically familiar with typography, it offers much interest in the parallel technical terms (more identical than might be supposed), as when he says of job offices that they are called *travaux de ville*

in French and *bottellame* in Italian. His conclusions are very flattering to our proficiency in the art of printing, which he places on a higher level than that of Europe; in mechanical contrivances unquestionably. These, he says, an Italian may admire, but cannot always avail himself of, for they have grown out of conditions that do not exist on the peninsula, where no daily newspaper attains an output of 200,000 copies, like that of the *Century Magazine*, with its special presses and special facilities for binding. The American skill in composition by hand seemed to astonish Signor Barbèra, who records, on Mr. De Vinne's authority, five columns of the *Century* in ten hours by the deftest compositor, and four for the less rapid. He has in vain challenged any Italian printing-office to rival this achievement, and he asks, Why the difference? He is convinced that our authors have a much better knowledge of the printing process than have the Italian, and hence send in "copy" in a state much more favorable to swift and accurate bookmaking, with fewer repentances and alterations in style or in proportion; and whereas in Italy it is the exception for a work to be complete in manuscript before it is committed to the printer, here it is the rule.

We part from these agreeable pages with mention of some instructive comments on a little incident of a personal nature. Signor Barbèra had gone to the *Century* office with an idea of making arrangements to translate for publication at home the series of articles by Castelar, then beginning in the magazine, on the centennial theme of Columbus and the discovery of America. He was allowed to borrow the Spanish manuscript, and to his disappointment found that "nothing more vacuous, more falsely rhetorical and conventional, had ever emanated from the pen of a writer of the Latin race." He accordingly expressed to the editors his surprise that that sort of rubbish (*roba simile*) could please North American readers. "We agree with you," answered the editors, "but we accepted it and paid roundly for it because it was Castelar's rubbish, and did what we could to prune its exuberance." No doubt the editors had bought their pig in a poke, and made the best of a bad bargain, and they are not to be judged like those purveyors of "opinion" who systematically impose *names* in place of thoughts upon an undiscerning public, to sell their magazines.

With the Turkish Army in Thessaly. By Clive Bigham, author of 'A Ride through Western Asia.' With illustrations and maps. Macmillan. 1897.

This is a succinct account of the Thessalian campaign just closed, prepared by Mr. Clive Bigham, who, without republishing his recent correspondence for the London *Times*, has utilized his telegrams and letters from the seat of war in preparing a fresh and fair account of the military episodes in Thessaly. In writing this book, as in the preparation of his original accounts for the press, Mr. Bigham frankly takes a more or less pro-Turkish point of view. This does not, thanks to a remarkable clearness of mind in the writer, color adversely to the Greeks our author's record of actual facts. It does, however, somewhat influence his brief account of the causes of the war; it leads him also to minimize the part played on the Turkish side by Germans, especially in the case of Grumbkopf Pasha. He is also somewhat loath to admit the important rôle of Captain von Morgen as Edhem Pasha's adviser. The pleasant social relations which Mr. Bigham enjoyed while with the Turkish army made it only too easy for him to dissociate the various Turkish "gentlemen" with whom he consorted from the policy of massacre and oppression with which Turkey has been and still is identified. He may, however, cite good authority for saying of the Turkish rank and file that, given "capable and acceptable officers," "organization increased to the utmost pitch of efficiency," and " a thorough moral and physical training," "you will have the most exceptionally strong army that has ever been let loose on the earth."

The twelve illustrations given by Mr. Bigham add to the powerful interest of his story by reproducing the beauty of the stage setting of this recent drama. The view of the frontier north of Meteora, prefixed to his account of the hard-fought battle there, the picture of the Green Mosque, and the bridge at Larissa, and the view, while it was actually in progress, of the battle at Velestino—the one Greek victory recorded—give a most welcome reënforcement to the writer's studiously clear descriptions of the country. In addition, the book contains six maps and three plans, so carefully prepared that the reader can easily identify every village, however small, and every pass, however unimportant, to which reference is made in the narrative of events. It is no little tribute to Mr. Bigham's essential fairness in this record that we can feel that the central point of interest lies in the brave stand made at Velestino by Smolensky. Nor does his criticism of operations in the field fail to show that, after all, the Greeks showed one point of superiority over their opponents—a better training in the use of artillery, so far as they made any use of it at all. The final impression gained from this book is that the Turks outnumbered the Greeks, and, therefore, won the day. Neither side appears to have shown military competence. Of the Turks Mr. Bigham says: "The strategy of the Turks was essentially dilatory; but, though apparently overcautious, they failed to show a just appreciation of the real dangers of war. They entirely ignored the true object of attack, the enemy's base, and advanced with a strong right instead of a strong left wing. They omitted to push home their advantages, and even the little cavalry they had was rarely employed." The Greeks showed even greater lack of foresight. They failed to cut the wires at Tyrnavos, deserted ammunition at Pharsala and Domoko, generally omitted to protect their flanks, only once detailed a rearguard, and never attempted to retard the Turkish advance by the simple expedients of blowing up a bridge or erecting any kind of obstacle.

The unity of effect achieved in this narrative is so happy that those who read it may almost regret as time misspent the attention given to piecemeal reports published in the daily press as the war proceeded. A certain falsity of perspective and lack of proportion is unavoidable so long as the events described are in progress, and renders the refashioning of a war-correspondent's original material before it appears in permanent form obviously necessary. This has rarely been done to better purpose than in the present book.

The History of Comines, Englished by Thomas Danett. Anno 1596. With an Introduction by Charles Whibley. 2 vols. [Tudor Translations.] London: D. Nutt. 1897.

Of this commendable series, reproducing in accessible form some of the masterpieces, forgotten or other, of old English prose, mention has already been made in our columns, in notices of Underdowne's 'Heliodorus' and North's 'Plutarch,' and the work now before us shows that the editor still has *la main heureuse.* While this translation has neither the linked sweetness and long-cadenced period of the one, nor the quaint and vivacious raciness of the other, it is a model of pure, manly, and majestic prose, stately without pomp, idiomatic without triviality, graphic without any straining for effect. No one can read Comines without thinking of Froissart, and it is to be hoped that the editor will see his way to reproducing the incomparable version of Lord Berners, which has almost unique merit in that it represents the best literary work of a period well-nigh unrepresented; for Berners, writing in his old age, uses the language and style of a previous generation.

Hardly more than half a century separates Froissart's work from that of Comines, and yet in passing from one to the other we pass into a new world. In the fourteenth century, chivalry, with its noble if somewhat fantastic ideals, still kept its hold upon men's minds. Knights still undertook daring deeds for glory or for ladies' smiles; vows upon the heron or the peacock were religiously performed. Kings could admire, praise, and bountifully reward heroic exploits, even though achieved by a foe. The man of gentle birth and breeding felt that a gulf separated him from the churl; and nobles and knights paused in their warfare to join in putting down the ferocious Jacquerie, as a thing that every gentleman was bound to suppress. Honor, or noble respect for one's self, and courtesy, or noble consideration for others, were still the cardinal virtues of the faith. In the world to which Comines introduces us, nearly all this has vanished. Success is the god of universal idolatry, and the end that justifies all means. Craft, fraud, and perfidy reign supreme. Everybody is plotting, perjuring himself, making and swearing to treaties only to gain time to break them effectually, carrying on secret negotiations on all sides, with doubly secret reservations. Prince A, having made a solemn alliance with Prince B, enters at once into secret negotiations with B's deadliest enemy, and, knowing that he is sure to be betrayed, takes care to be the first to let B know what he is doing, and to assure him that it is all pretence. The Constable of St. Pol is at one and the same time betraying Burgundy and England to France, and France and England to Burgundy. In the midst of all these monstrous webs of craft sits the arch-plotter Louis XI., reading their treasons like an open book, outwitting them all, and almost hoping to outwit Death himself.

Comines's portrait of this extraordinary monarch is a masterpiece. Far from being the gloomy, superstitious, and essentially vulgar tyrant of popular imagination, Louis was one of the most intelligent sovereigns that ever mounted a throne. He understood

the age he lived in and the men he lived among, and he saw that policy in the end was always an overmatch for brute force. We might really call him a patriotic king, for the business of his life was to make France strong, united, and prosperous. To do this he had to lower the pride and sap the strength of his great feudatories, to pull down the haughty and exalt the lowly, and substitute the King's justice for the violence of turbulent barons. The tremendous task assigned him was to transform feudal into royal France, and that by sheer force of intellect. The historian recognizes the real greatness of the man, while not blind to his defects; and, after having traced his career to his strange and gloomy end in the dungeon-palace of Plessis, sums up the whole in this magnanimous fashion:

"All this above written I have rehearsed, not so much to publish the suspicions of the King our master, as partly to proove that the patient enduring of these passions being equall with those he had caused others to endure, and this sicknes being sharpe and troublesome to him, and the which he feared greatly before he fell into it, is to be accounted as a punishment God gave him in this world, to ease him in the world to come; and partly to give an example to those that shall come after him, to have some more compassion on their people than he had, and to be less rigorous in punishing than he was. Notwithstanding, for my part I am not able to accuse him, neither saw I ever a better Prince; for though himselfe pressed his subjects, yet would he suffer none other so to do, friend or foe."

Of the translator, Thomas Danett, almost nothing is known. Besides this version, he wrote two other works, a history of the Low Countries, epitomized from Guicciardini, and a continuation of the history of France from the death of Charles VIII. to that of Henry II.; but it is his translation of Comines that entitles him to an honorable place in literature. Nor is he merely a translator; he enriches his text with excellent notes, correcting errors, explaining phrases and customs, elucidating obscurities, and so forth, which show him to have been a man of wide and varied knowledge.

Of the beauty of this version something has already been said. It is in some respects even better than the original, for Comines inclines to dryness, and in his severe self-repression is sometimes rather colorless, while his translator delights in touching the narrative with brighter color and infusing warmer blood. He does not shrink from a homely idiom or vivid phrase. The weaker of two competitors "hath the woorse end of the staffe"; an historian who makes a blunder "misseth the cushion." The insurgent Liégeois seize an objectionable Master Robert, and, Comines tells us, "made several pieces of him"; the translator—"they hewed him into a number of small gobbets."

The following extract will give an idea of Danett's more vivacious style. Olivier, the King's barber and factotum, has been sent to Mary of Burgundy, richest heiress in Europe, to persuade her to put herself into Louis's wardship, and especially, if he could, to stir up a revolt in Ghent, where the lady was.

"Notwithstanding that he were not in their Towne-house to speake publikely to their Senate, bicause he meant first to assay if he could do any good with this young Princesse, yet was his enterprise smelt out; wherefore after he had sojourned a few daies in Gaunt, he was sent for to declare his message; whereupon he repaired to the Princes [Princess's] presence, being apparelled much more sumptuouslie than became one of his calling, and delivered his letters. The said Lady sate in hir chaire of estate, having about hir the Duke of Cleves and the bishop of Liege, with divers other noblemen and a great number of hir subjects. When she had read hir letter, she commanded him to declare his message. But he answered that he had nothing to say but to hir selfe alone. Whereupon it was told him that this was not the maner of their countrie, especially to commune in secret with this yoong Lady, being unmarried. But he still continued his former answer, that he had nothing to say but to hir selfe apart. Whereupon they threatened to make him say somewhat else; which words put him in feare. And I thinke verily that when he came to deliver his letter, he had not bethought him what to say; for this was not his principall charge, as you have heard. Thus Master Oliver departed for this time without further speech. Some of the Councell began to scorne him, as well bicause of his base estate as of his foolish speech and behaviour, but especially they of Gaunt (in a little village neere whereunto he was borne), scoffed and derided him, so far foorth that suddenly he fled thence, being advertised if he staide there any longer that he should be throwen into the river; which I thinke would have prooved true."

Matka and Kotik. A Tale of the Mist Islands. By David Starr Jordan. San Francisco: Whitaker & Ray Co. 1897. 8vo, pp. 76, with many illustrations.

This little volume is based on a lecture delivered in Washington after the return from Alaska of the seal commission of 1896, by President Jordan. His official position precluding a formal public statement of his observations and conclusions before the publication of his official report, the lecture took the form of an account of the vicissitudes of seal life, involving the personification of a family of seals. No official objection could be well raised against what purported to be a modern fairy tale, and thus the form in which the matter is presented is accounted for. As a matter of fact, the book gives an excellent and finely illustrated popular description of the life and habits of the seals. The pictures, being reproductions from photographs, are devoid of that element of caricature which has impaired the value of some other seal portraits. The book is elegant in its make-up, and no doubt will find a place in many libraries. The natural history behind its mask of fancy is abreast of the latest investigations.

The only criticism which seems called for relates to the denomination of the pelagic sealers as "pirates." Seal-killing or sheep-killing is cruel, by land or sea, and the starving pups of St. Paul Island, like the dying young birds of Florida heronries, are entitled to our active sympathy. The pelagic sealers, however, are merely exercising their undoubted rights in killing wild animals in the open sea; and the popular ignorance of international law should not be catered to, even in a work of fancy, by the employment of epithets which, in this connection, are abusive and unjust.

Summer Literature.

THOSE who keep up with the data concerning current fiction will remember that a list of 489 of the leading books published in 1896 was submitted to 800 librarians early in the year with a request that they vote as to the "fifty best books" therein contained. When the results came to be tabulated it was found that twelve out of the fifty thus selected by trained experts (eight of these being in the first twenty-five), including number one, were publications of Messrs. CHARLES SCRIBNER'S SONS, a fact sufficiently noteworthy when one reflects that the list was extremely comprehensive and was passed upon by men peculiarly fitted to decide the question of a volume's popular effectiveness.

Barrie, Stevenson, and Stockton.

Heading this list was "**Sentimental Tommy**" (Illustrated by William Hatherell, 12mo, $1.50), that fascinating study in boyhood with which Mr. J. M. Barrie so greatly increased his circle of admirers, and it was but natural that the same author's "**Margaret Ogilvy**" (with frontispiece portrait, 12mo, $1.25) should take its place close behind the former work. It has required already sixty or seventy thousand copies of each volume to keep up with the demand for these books here and in England, and the almost unanimous opinion of the critics seems to be that they represent Mr. Barrie's literary apogee thus far. How good they must needs be to warrant such an opinion every reader can imagine. Among the other lighter works in the above list were naturally two by Robert Louis Stevenson: "**Weir of Hermiston**" (12mo, $1.50) and "**In the South Seas**" (12mo, $1.50). The former Stevenson himself declared to contain much of his best work, and his literary executor, Mr. Sidney Colvin, has been one of many well-known critics who have confirmed this judgment; the latter volume contains an account of the wanderings of the Stevenson party among the Marquesas, Paumotus, and Gilbert Islands in the yacht *Casco* and the schooner *Equator* in 1888-9. It is hardly necessary to say that no one else has ever written of these South Sea Islanders with such a happy combination of sympathetic insight and felicitous expression. Still another story from the same much-lamented hand is to be published this fall by the Scribners. "**St. Ives**" (12mo, $1.50) tells in the most buoyant manner the adventures of a Frenchman who escapes from an Edinburgh prison and meets with many truly Stevensonian adventures ere he again beholds his native land. Of course Frank R. Stockton would be sure to be represented in any such gathering of notables. "**Mrs. Cliff's Yacht**" (Illustrated by A. Forestier) proved no less seductive than its immediate predecessor, "**The Adventures of Captain Horn**" (each 12mo, $1.50), and Mr. Stockton has recently made still another addition to his already long list of volumes in the collection of short stories called "**A Story-Teller's Pack**" (Illustrated, 12mo, $1.50). Mr. William Dean Howells has recently made an illuminating analysis of this volume and Mr. Stockton's methods. He explains part of the author's success by showing that he has brought the art of dispensing humor with an entire sobriety of demeanor to "higher artistic perfection than it has ever had before. There is not a word of suggestion or preparation from him who tells these tales, and the others in this charming, this consoling book." After asserting and pointing out the unique character of Mr. Stockton's work, the famous critic goes on to say: "In this latest book of his there is not one disappointment. Life cannot be without an object as long as there is the hope of something more from him."

Richard Harding Davis, Mrs. Burnett, and E. H. Hornung.

It would not be very venturesome to predict that should the books of 1897 be treated similarly to those of last year "**Soldiers of Fortune**" (illustrated by C. D. Gibson, 12mo, $1.50) would hold the place now held by "**Sentimental Tommy.**" The London *Academy* says: "Mr. Davis has vigorous ideals; he is in love with strength and cleanness, with 'grit' and resource, with heroism and courage in men; with beauty and frankness, with freshness and youth in women; and liking these qualities, he also likes writing about them. . . . Mr. Davis has the dramatic gift—he carries you along with him. One need not wish for a better story of action than this," and to find the laudations of the story at home it would be merely necessary to make a list of the reviews which have appeared. It may put the matter more tangibly to some minds to state that the book, although published late last May, just at the beginning of the "dull season" in the book trade, is already in its fortieth thousand. With a different enough manner and setting Mrs. Burnett's "**Lady of Quality**" (12mo, $1.50) provides equally captivating reading, and the author now has in press a unique companion to this striking "Curious Hitherto Unknown History." "**His Grace of Osmonde**" (12mo, $1.50) tells the man's side of this most entertaining story, and all who are familiar with Mrs. Burnett's subtlety and ingenuity of treatment will recognize the great possibilities of such a dovetailed romance in her hands. "**A Lady of Quality,**" by the way, deserves a line of statistics, for it is among that sufficiently limited number of books which pass the twenty-five thousand mark in their first year of existence. Returning again from the age of the *Tatler* to To-day—one could hardly select a more entirely satisfactory group of stories for summer or any other time of the year than the lively Australian-English romances of Mr. E. W. Hornung. "Just as Jim Bludso saw his duty, so does Mr. Hornung see his reader's interest—'a dead sure thing, and he goes for it thar and then.' . . . We cannot call 'My Lord Duke' anything but one of the most agreeable novels that we can remember," says the London *Academy*, and besides "**My Lord Duke**" (12mo, $1.25) Mr. Hornung has brought out through the Scribners "**The Rogue's March**" (12mo, $1.50), "**A Bride from the Bush**" (*Ivory Series*, 16mo, 75 cents), and "**Irralie's Bushrangers**" (*Ivory Series*, 16mo, 75 cents). The first and last of these deal with the Australian "bush," but "*My Lord Duke*," like "*A Bride from the Bush*," depends largely for its effects upon the incongruities resulting from transplanting a Colonial to London society. Mr. Hornung takes firm hold of one's attention at the outset and he keeps it till the last word.

Some More Fiction.

IN a cover as artistically attractive as the author's style, there appeared a short while ago a novel by Mr. Walter Cranston Larned entitled "**Arnaud's Masterpiece**" (12mo $1.25). Of this mediæval "Romance of the Pyrenees," the Detroit *Free Press* remarks appreciatively: "'**Arnaud's Masterpiece**' is distinguished by a sweet and noble seriousness; it is calm and quiet; there is nothing common or unclean within its pretty covers." Sharply contrasting with the simplicity and elevation of Mr. Larned's story is the volcanic volume which heralded "Benjamin Swift's" advent in the front rank of our modern novelists last year. *The Critic* said of "**Nancy Noon**" (12mo, $1.50. *Fifth edition*): "Power there is in this book in such measure as is not given to the first comer; power of thought, of feeling, and of expression. It has a trick of lingering in the memory when it is over, and some of its chords are touched as by a master hand," and the same originality and forceful virility are prominent in the author's new book, "**The Tormentor**" (12mo, $1.50), which will appear this autumn. Cy Warman, too, has a new volume in press called "**The Express Messenger, and Other Tales of the Rail,**" which should prove as popular as his "**Tales of an Engineer, with Rhymes of the Rail**" (each 12mo, $1.25). Mr. Warman's stories carry one along as irresistibly as did ever his engine when his hand was on the throttle. Another welcome volume will be "**The History of the Lady Betty Stair**" (illustrated by Thule de Thulstrup, 12mo, $1.25), a touching romance by Molly Elliot Seawell. Miss Seawell's "**Sprightly Romance of Marsac**" (illustrated by Gustav Verbeek, 12mo, $1.25) is one of the deftest, cleverest tales imaginable.

Some Outing Books.

The Scribners' list of "popular science" books is particularly strong. Easily at the head of this group is Mrs. William Starr Dana's "How to Know the Wild Flowers" (with 152 illustrations, crown 8vo. $1.75 *net*), whose effective grouping *according to color* and literary charm, have necessitated the issuing of some thirty-two thousand copies. For the amateur ornithologist there are John B. Grant's "**Our Common Birds and How to Know Them**" (illustrated, 12mo, $1.50 *net*), in its thirteenth thousand; "**The Bird's Calendar**" (illustrated, 12mo, $1.50 *net*), a series of charming essays by Mr. H. E. Parkhurst, who will add a companion volume to this in the Fall; "**Song Birds and Water Fowl**" (illustrated by Louis Agassez Fuertes, 12mo, $1.50 *net*); "**The Out-of-Door Library,**" four attractive volumes on "Angling," "Hunting," "Mountain Climbing," and "Athletic Sports" (each profusely illustrated, 12mo, $1.50); and four volumee treating of the famous "**American Summer Resorts**" (each 12mo, 75 cents).

Educational

CALIFORNIA, Belmont (In the foothills near San Francisco)

BELMONT SCHOOL for Boys hopes to deserve the confidence of Eastern as well as of Western parents by surrounding its boys with as stimulating an intellectual, spiritual, and physical life as is found in the best Eastern schools, and by offering a home which in beauty of surroundings and fineness of climate for sustained work no Eastern school can hope to equal. It should give to its boys a healthful impulse towards good thinking and good living, and leave with them a heritage of pleasant and helpful memories.

The catalogue, containing views of the school and a record of the colleges and technical schools entered by its graduates, will help to give an idea of its spirit and the work it is doing

NEW BOOKS PUBLISHED BY THE MACMILLAN COMPANY

FOR THE YOUNG FOLKS. *FIFTH THOUSAND.*

CITIZEN BIRD: A Story of Bird-Life for Beginners.

By **MABEL OSGOOD WRIGHT,** *Author of "Birdcraft," "Tommy Anne," etc.*

Cloth, 12mo, $1.50.

and **Dr. ELLIOTT COUES,** *Author of "Birds of North America," etc.*

Illustrated with Drawings from Nature by LOUIS AGASSIZ FUERTES.

A charming story for the young people, which contains not only much information about the life of birds in general, but also a guide to all the chief varieties of North American birds, their habits, economic value, etc.

"Teachers of natural science will find in Mrs. Wright's 'Citizen Bird' a delightful book for young people, written especially for those who are making a beginning in the study of bird life."—*From the New York Times.*

"'Citizen Bird' is a delightful and at the same time a most instructive book. None of us know as much as we ought about birds, and whether old or young we can easily increase our knowledge by spending an hour or two in perusing 'Citizen Bird.'"—*From the New York Herald.*

"There is no other book in existence so well fitted for arousing and directing the interest that all children of any sensibility feel towards the birds." —*From the Chicago Tribune.*

The Rural Science Series.

Edited by **Professsor L. H BAILEY,** *Cornell University.* Two new volumes.

The Principles of Fruit-Growing.

Fundamentals Common to all kinds of Fruit-Growing.

By Prof. L. H. BAILEY,
Professor of Horticulture, Cornell University.
Cloth, 12mo, **$1.25.**

The Fertility of the Land:

A Discussion of the Relationship of Farm Practice to Saving and Augmenting the Productivity of the Soil.

By I. P. ROBERTS,
Director of the College of Agriculture, Cornell University.
Fully Illustrated. **$1.25.**

Genesis of the Social Conscience.

The Relation between the Establishment of Christianity in Europe and the Social Question.

By HENRY S. NASH, *Professor in the Episcopal Theological School, Cambridge.*

Cloth, 12mo, **$1 50.**

"Professor Nash's volume fulfils the promise of its title. It does more, indeed, for the author is something more and better than a mere epitomizer of other men's thoughts. Not only is his treatment of the great thesis which he has undertaken to discuss free and suggestive, but he shows himself to be a clear and original thinker."—From *The Tribune*, New York.

The Myths of Israel.

The Ancient Book of Genesis, with Analysis and Explanation of its Composition.

By AMOS K. FISKE,
Author of "The Jewish Scriptures," etc.
Cloth, 12mo, **$1.50.**

The author resolves the ancient Hebrew Book of Genesis into its component myths, explaining their significance and bearing in the literary and religious development of the Hebrew people.

The Social Teachings of Jesus:

An Essay in Christian Sociology.

By Professor SHAILER MATTHEWS, *Chicago University.*

Cloth, 12mo. *In Press.*

It is based on the belief that Jesus as a strong thinker must have had some central truth or conception. Starting with this fundamental conception, the author endeavors to trace its application by Jesus himself to various aspects of social life.

NEW NOVELS FOR SUMMER HOLIDAY READING.

The Grey Lady.

By HENRY SETON MERRIMAN.
Cloth, crown 8vo, **$1.50.**

"Deeply interesting, original, and cleverly constructed."—*The Oakland Tribune.*

The Choir Invisible.

By JAMES LANE ALLEN,
Author of "A Kentucky Cardinal."
Cloth, cr. 8vo, **$1.50.**

In the Tideway.

By FLORA ANNIE STEEL,
Author of "On the Face of the Waters."
Cloth, 16mo, **$1.25.**

A Rose of Yesterday.

By F. MARION CRAWFORD, *Author of "Casa Braccio," etc.* Cloth, Crown 8vo, **$1.25.**

Mr. Crawford is, as ANDREW LANG says, "the most versatile and various of modern novelists. . . . A master of the narrative style, he throws a subtle charm over all he touches." Mr. Allen, also, so Bliss Carman writes, is "one of the first of our novelists to-day," with "a prose style of wonderful beauty," while Mrs. Steel's new book is described as "a piece of evenly brilliant writing."

SHORT STORIES.

In the Land of the Snow Pearls.

Tales of Puget Sound.

By Mrs. ELLA HIGGINSON.
Cloth, cr. 8vo, **$1.50.**

Old Times in Middle Georgia.

By the Author of "Dukesborough Tales."

By R. MALCOLM JOHNSTON.
Cloth, cr. 8vo, **$1.50.**

Each of these volumes is a picture of life in one section of the country, very successful in preserving the local atmosphere. As the Detroit *Free Press* says of the tales of Puget Sound, "there is not a dull story in the book." To Mr. Johnston we owe the permanent possession of a view of life which now belongs to a vanished past.

JUST READY.

With the Turkish Army in Thessaly.

By CLIVE BIGHAM, *Author of "A Ride Through Western Asia."*

With Illustrations and Maps. Cloth, 8vo. Price, **$2.50.**

This is the book which was reviewed at some length in the NATION last week, with comments on the writer's "essential fairness." "studiously clear descriptions," "the powerful interest of his story," etc., and with the following paragraph in conclusion:

"The unity of effect achieved in this narrative is so happy that those who read it may almost regret as time misspent the attention given to piecemeal reports published in the daily press as the war proceeded. A certain falsity of perspective and lack of proportion is unavoidable so long as the events described are in progress, and renders the refashioning of a war correspondent's original material before it appears in permanent form obviously necessary. This has rarely been done to better purpose than in the present book."

ADDRESS

THE MACMILLAN COMPANY, 66 Fifth Avenue, New York.

The Nation.

NEW YORK, THURSDAY, AUGUST 5, 1897.

The Week.

The scheme of having jubilations in all parts of the country over the passage of the Dingley tariff law fell through, fortunately for its promoters. It would have been the very irony of fate if such a celebration had occurred in Lawrence, Mass., on Saturday evening, to be followed on Monday morning by the announcement that two great mills, employing more than 2,000 hands, would shut down through a part of August; or in Manchester, N. H., to be followed within forty-eight hours by the notice that the great Amoskeag mills, employing about 8,000 operatives, would shut down through the month of August, if not longer. Nobody will be surprised to learn that in the former city "the news was hardly believed at first, in view of the promises made in the past years that, when a new tariff law had been passed, full time and full wages would be resumed in all the Lawrence mills." Protectionists will cite the fact that similar shut-downs have occurred of late years in the summer season at both Lawrence and Manchester, but that was under a Democratic administration and a "free-trade tariff." That such a custom should be maintained under a Republican President, and put into effect just after the passage of a high-tariff law, is nothing short of a breach of the contract to restore prosperity which the party made with the operatives last fall.

The favorite railing accusation brought against the Wilson bill has been, of course, that it was such a failure as a revenue-producer. Dingley was to mend all that from the first day. The Treasury was instantly to gain $100,000 a day. Well, the confounded facts will not bend themselves to this view. Receipts from customs for the first four days of the Wilson bill were upwards of $3,250,000. Dingley's first four days brought in $1,621,500—or almost precisely one-half. No one need suppose that we regard this showing as really proving anything about the ultimate efficiency of the Dingley bill as a means of producing revenue. It is only a convenient gag to put in certain noisy protectionist mouths. Mr. Dingley will have to send out his first monthly statement with a deficit of $11,073,544, just as if he were another incompetent Wilson. If the point is made that this month of July is five-sixths Wilson and only one-sixth Dingley, we have to record the fact that the one-sixth Dingley increased the deficit by just about $600,000 beyond the amount where the Wilson bill left it. This is the more unlucky in view of the fact that Wilson was able to close his first month with a substantial surplus.

People who watched the heedless extravagance of the last Congress were not surprised at the announcement, in Monday's Washington despatch, that the fiscal year had begun with a July deficit of $11,073,544; nor at the accompanying explanation that "this deficit is accounted for by abnormally heavy expenditures incident to the beginning of the new fiscal year." July expenditures, say the somewhat faint-voiced defenders of the recent fiscal measures, are always far beyond the monthly average. Nothing could be more true. But when the total disbursements of July, 1897, are $50,100,908, against $42,088,468 in July, 1896, and $38,548,063 in July, 1895, suspicion arises that something more than the movement of the seasons is responsible for the inroad on the Treasury. It will be noticed that the month's Government revenue runs almost exactly ten million dollars over the revenue of July, 1896, and yet that the month's deficit is left at more than eleven millions. With such an introductory showing for the fiscal year, the future movement of the revenue, when the Dingley tariff is left alone in operation, becomes a matter of real concern.

The decided decline in the price of silver is hard to reconcile with the reports of the progress made by Senator Wolcott's embassy. We have been assured that the active coöperation of France and the passive aid of England could be depended on, and leading authorities on bimetallism have told us that with such assistance silver could be reinstated. In the face of all this, silver goes down in price with accelerated speed. Possibly a gigantic monetary conspiracy is working to produce this result. Wicked capitalists may reason with themselves that, as silver is presently to be doubled in value by international agreement, it will be a profitable commodity to hold. They may, therefore, have combined to depress the market in order to obtain a stock of silver at the lowest possible price, expecting to sell out at an enormous advance. This explanation ought to recommend itself to the believers in silver. It implies that silver will advance in price, which they believe; that such persons as have a large stock of it on hand will make a great deal of money, which they cannot deny; and that the "money kings" are disposed to do just what Debs and Bryan and Altgeld declare they have always done and will always try to do.

There is a very different explanation of the falling price of silver, and a more rational one. The fall is due to the expectation that silver will be worth less in the future than it is now. The quantity produced is increasing very much, and the cost of producing it is steadily diminishing. On the other hand, the demand for it as money is falling off. Our own Treasury is overloaded with it. The German Government has a large quantity for sale, and so probably has Austria. The French have more silver than they wish they had; the Indian mint is closed; Japan is adopting the gold standard. We begin to hear talk of a change of standard in Mexico, the losses and vexations arising from the silver standard becoming intolerable. Under these circumstances it seems much more reasonable to hold that silver is falling in price because people believe it will not be remonetized than because they believe it will be remonetized. In other words, the financial world regards our silver embassy as a humbug, and does not expect that anything will be done for silver through it or any other agency.

Secretary Gage's speech at Boston on July 27 was rather in the nature of a dose of soothing-syrup than of a thorough-going remedy for our financial situation. In this respect it was less encouraging than his speech at Cincinnati a few weeks ago. The latter had a resolute tone which betokened that the Administration knew what it wanted, intended to go for it, and expected to get it. That speech did a great deal of good in the way of reviving confidence here and abroad. The Boston speech lacks the confidence and vim which imparted so much of hope to those who share Mr. Gage's views in general. They believe with him that the tribulations of the last three years will always beset our currency and our standard of value as long as they remain on their present sandy foundation. They believe, too, that no step will ever be taken towards amendment unless those who know the truth are prepared to fight for it against any odds, whether the opponents be Bryan Democrats or McKinley Republicans. To all such we fear that Mr. Gage's words at Boston will come as a disappointment, for he tells us that there is no pressing need for haste, no immediate occasion for anxiety, that we have ample reserves in the Treasury and good prospects, and so forth. This is exactly what the do-nothings in Congress tell us, and now they will strengthen their own position by quoting the Secretary. All that he says now will be used against his own plan of currency reform next winter, no

matter what that plan may be. The do-nothings will say, "Why not let well enough alone?" If there is no pressing need for haste, and no immediate occasion for anxiety, the average Congressman will conclude that it will be time enough to meet the danger when it comes. It will be hard for anybody to meet that argument who has once used something like it himself.

Last year the Democrats of Maryland, with manifest reluctance, endorsed Bryan and his platform, and in this policy Senator Gorman joined, although much against his inclination. The result was a disastrous split in the party, and its defeat by a plurality of 32,000. Cleveland's plurality over Harrison in 1892 was 21,000. A change of more than 50,000 in the vote of the State was caused by the fatuous and dishonest policy of the Chicago convention, and a seat in the Senate was lost at the same time. The lesson was well calculated to lead to reflection, and Mr. Gorman has naturally made different arrangements for the present year. Circumstances and President McKinley have enabled him to do so. The Wolcott Commission has served his turn perfectly. He has "taken passage" with the present Administration, and he seems to enjoy his company very much. In their declaration of principles the Maryland Democrats say:

"We note with satisfaction that the demand of more than 6,500,000 of Democratic voters, expressed at the polls last November, has compelled President McKinley and a Republican Congress to urge upon the European Powers, through the medium of a duly appointed commission, the necessity for an international conference to arrange the terms of a bimetallic system under the operation of which both gold and silver shall be used and recognized as money of final redemption."

They further affirm that they stand where they always have stood. They "believe now, as they always have believed, in honest money, the gold and silver money of the Constitution, and the coinage of both metals without discrimination against either into standard dollars of final payment and redemption"—but not at any particular ratio. The essence of the Chicago platform and of the whole Bryan campaign was in the fixing of the ratio of 16 to 1. That was the Democratic new departure. The platform on which Mr. Cleveland was nominated in 1892 called for "the coinage of both gold and silver without discriminating against either metal," but it required that the two kinds of dollars should be of the same intrinsic value. There is nothing in the Gorman platform that requires them to be of the same intrinsic value or of any value. The Maryland Democrats have simply straddled the question, and they have found in the Wolcott commission the excuse for doing so. What a useful thing a roving bimetallic commission is. Its advantages are not confined to any political party.

On the day that President McKinley promulgated his order regulating removals from the service, Judge Jackson of the United States Circuit Court, sitting in Parkersburg, W. Va., granted an injunction restraining a newly appointed (Republican) marshal from removing (Democratic) deputies without assigning reasons, and presumptively on political grounds. The Judge referred to the fact that such places had in the past been regarded as party spoils, but insisted that the civil-service act had changed all this, and maintained that the act of itself prevents partisan removals, saying on this point:

"If there is anything in the civil-service act, the office is one fully protected by it, and the occupant is withdrawn from the spoils of party. In my judgment the civil-service act is a law founded in wisdom, and if it is executed in the same wisdom in which it was conceived and enacted, it will not only prove to be one of the wisest statutes that have been enacted in the latter part of this century, but one of the safeguards of our republican institutions. The incumbent is protected in the enjoyment of his position by the civil-service act."

This is the most advanced ground ever taken by the courts in the matter. If it shall be sustained in the event of an appeal, it will show that the President's recent order forbidding removals, except for just cause duly ascertained, was really not needed, because the law itself prohibited such removals. Yet many thousands of clerks in Washington have been trembling ever since last November for fear that the bread might presently be taken out of their mouths. It is something fine to have materially added to the happiness of so many human beings by an order which at the same time improves the conduct of the public business.

In one day's telegraphic despatches last week there casually appeared three items that ought to furnish protectionists food for serious reflection. The new underground railway in London is to be equipped with electrical locomotives, carriages, machinery, etc., made by an American concern, the General Electric Company. Protesting English concerns are informed that the American electrical appliances are the best and cheapest that can be procured. In the House of Commons the Secretary of State for India explained that the East Indian Railway, which is owned by the Government, had bought 7,708 tons of rails from the Maryland Steel Company, because that company offered them for £8,675 less than was demanded by the lowest British bidder. And from Wilmington, Del., the announcement comes that the Jackson & Sharp Company of that city has entered into a contract to build a number of cars for the Southeastern Railway of England. What view shall be taken of such extensions of American enterprise as these? It seems reasonable to regard them with satisfaction and to frame our fiscal laws in such a way as not to discourage them. But our new tariff is calculated to discourage them. It is intended to give our manufacturers the home market, and it will end by giving them no other.

The protest against President Andrews's forced resignation, which a majority of the Brown faculty signed and published on Tuesday, puts the case for freedom of teaching in a way to win the sympathy of every lover of academic liberty and progress. We certainly do not want to see the *Lehrfreiheit* in this country descend to the level it touched in Prussia under Frederick William III.; that amiable monarch proclaiming that the university professors were free to teach whatever they pleased, though, of course, they must not advance any views of which he disapproved. The Brown professors also, it seems to us, make a pretty effective retort to the trustees on the basis of the merely pecuniary interests of their institution. The trustees rested their case on the pecuniary losses sustained by reason of President Andrews's vagaries. If they cannot sustain this position their case is weaker than we supposed. Irrespective of the past and of endowments that might have been received, it is at any rate evident now, after the fact, that the action of the trustees is likely, for some time to come at least, to injure the material interests of the university. If they had based their action on the ground that a college president should devote less of his time to outside enterprises, and avoid giving alumni and intending patrons the impression of a flighty and erratic mind, not without a dash of love of notoriety thrown in, they would have had a surer footing. The affair has now taken a shape which all friends of Brown, and of academic peace and dignity, must deplore.

There are 25,000 Japanese in the Hawaiian Islands—probably ten for every American there. If we must annex for the sake of our one, Japan may at least show some concern over what will happen to her ten. Now the Japanese Minister points out that the extension of the naturalization, immigration, customs, and navigation laws of the United States to Hawaii—an extension which would *ipso facto* follow annexation—would injure these 25,000 Japanese in both person and property. They would at once lose their right to become citizens of Hawaii; no "Asiatic" can be naturalized under the laws of the United States. They would lose their valuable carrying trade. They would probably

lose their "full liberty to enter, travel, or reside in any part" of the country. That phrase is taken from the treaty between Japan and the United States, which is to go into effect in 1899; but the clause quoted is modified by another which says that the stipulations of the treaty "do not in any way affect the laws, ordinances, and regulations with regard to trade, the immigration of laborers, police, and public security which are in force or which may hereafter be enacted in either of the two countries." United States courts have held that the Chinese exclusion act applies also to Japanese. Mr. Sherman remarks that this decision has not been sustained by the Supreme Court; but what guarantee have the Japanese that it will not be? How can they be blamed for pointing out the danger that the elementary personal rights of 25,000 Japanese in Hawaii will be absolutely and remedilessly extinguished by annexation?

As Mr. Chamberlain sees that he is not likely to cover himself with glory by getting up an imperial customs union, he has fallen back on a minor measure of protection, the foreign prison-made-goods bill. It must be said that the English Parliament has seldom occupied so humiliating a position as in submitting to the "jamming through" of this measure for prohibiting imports. The Government scarcely attempted to defend it, and made a most pitiable showing in trying to evade the awkward questions that were raised in debate. One member stated that he imported wheat from Argentina in bags, and that in that country bags were made in the prisons, and desired to know if such wheat was to be excluded. He was told that the Government would not go to the length of prohibiting imports under such circumstances. Another member said he came from a part of Scotland where they imported from Sweden and Norway many boats caulked with prison-made oakum, and he wanted to know if the trade would be illegal. The Government in reply begged honorable members not to go on raising such trivial points. Members, however, continued, and showed that some of the finest Burmese carving was executed in the jail of Benares, some of the finest Indian carpets in that of Lahore, some of the finest furniture in that of Agra, and some of the best work in copper and brass in the jails of Rangoon and Mandelay. Every traveller in India now brought some of these articles back with him, but the bill would prohibit their introduction into England. The Government had nothing to say about this aspect of its measure, except that it was not meant to interfere with the private collector, and that words should be inserted to accomplish this result. Thereupon, another member pointed out that such words would render the bill utterly useless, for a dealer need only set up his shop on the other side of the Channel and sell his goods directly to purchasers in England. The Government replied to this that all it meant was that if a traveller wished to bring home a piece of old carpet he should not be prevented. This brought out the inquiry how old carpets could be produced in prisons today, to which no answer was vouchsafed.

The action of England in denouncing the old treaties with the German Zollverein and with Belgium is a necessary sequel to the reduction of duties on English products lately proposed by the Dominion of Canada. Under these treaties such a reduction of duties would apply to Belgian and German goods. The treaty with Belgium contains the following clause: "Articles the produce or manufacture of Belgium shall not be subject in the British colonies to other or higher duties than those which are or may be imposed upon similar articles of British origin." The German treaty contains a provision of similar effect. It might be naturally inferred from some of Sir Wilfred Laurier's remarks that the Canadian Government had not considered the nature of these treaties when it decided on its new policy towards English imports. The contrary is true, although the Premier spoke as if it were doubtful whether the treaties constituted an obstacle, whereas they are entirely free from ambiguity. No plainer language could be employed to express the intention that no higher duties should be imposed on Canadian imports from Belgium and Germany than on those from England. Had Belgium made her own treaty with Canada, then the "most-favored-nation" clause would have read that the products of Belgium should not be subject to any higher duties than the products of any other foreign country. The fact is that England undertook to answer for the tariff laws of her colonies, and that she has now decided that the colonies shall determine their own policy. The occasion of this decision is undeniably the proposal of Canada to grant England some special favors; but it is in harmony with free-trade principles to accept reductions of tariff obstacles whenever they are offered. The Cobden Club recommended the termination of these treaties.

A set debate on foreign affairs took place in the House of Commons on July 19, on occasion of passing the Foreign Office estimates. This gave Mr. Curzon an opportunity to review the course of events in Turkey for two years past, and a gloomy review it was. As to Armenia, all that Mr. Curzon could assert was that, while "no doubt great distress continues to prevail," there have been no organized massacres since March. "Isolated cases of murder" he admitted, but the great, the signal proof of the wisdom and beneficence of the Concert of Europe in dealing with the Armenian question was that for three months the Sultan had refrained from wholesale slaughter of his Armenian subjects. Touching those wonderful "reforms" which the Powers secured from the Porte two years ago, Mr. Curzon said that they had been put into operation "in parts of Asia Minor," but added regretfully that he did "not know that the result had been altogether satisfactory." It seems that in many cases the Armenians, who, according to the Sultan's agreement with the Powers, had been appointed to the police and the gendarmerie, had "subsequently resigned." One wonders if the "isolated murders" of Armenians had anything to do with these strange resignations. All told, the confession of impotency and frustration, as far as Armenia is concerned, could not well have been more humiliating.

After a severe struggle the charter of the Bank of France has been renewed by the Government, upon terms that are comparatively satisfactory. A very determined attempt was made to get the Government into the banking business, as we have done here, but a majority of the Deputies finally voted against the proposal. The arguments against banks with which we are familiar were all rehearsed; our demagogues have no monopoly of them. Even the sub-treasury scheme of our Farmers' Alliance was vigorously advocated, and the deplorable condition of the French peasant was depicted in the very language of our free-silver agitators. The Socialists were determined that the bank should establish a mortgage department, and issue money to the peasants on real-estate security, and some concessions had to be made to them on this point. The "Agrarian" party in Germany is apparently about to make similar proposals concerning the Reichsbank. This party has long complained that the bank did not consider the "landed interest"; this interest wants credit, and the bank has refused to give it. The demand now is that the bank shall "issue money directly to the people"—that is, shall increase its notes in order that they may be loaned to the proprietors of land. The Agrarian party is so strong that these demands cannot be ignored. They will not be defeated without a struggle, and the "currency problem" may therefore presently confront the German people. When we compare the smooth working of the English system with the difficulties and dangers that most other countries experience, it seems strange that any considerable number of people in this country should object to establishing our currency on a permanent basis.

THE REFORM VICTORY.

President McKinley deserves and will receive the heartiest praise of good citizens, without distinction of party, for the amendments to the civil-service rules which he made before starting on his vacation last week. It is not too much to say that, under all the circumstances, they constitute the greatest victory for the reform since the passage of the original law on the subject early in 1883. The spoilsmen themselves will be the first to see that this action by the President sounds the death-knell of the hopes which they have always cherished that the merit system might be overthrown.

There have been four changes of administration since the law of 1883 was enacted. Only a few thousand places had been brought within the classified service before the end of Mr. Arthur's term, and Mr. Cleveland was so thoroughly committed to the reform that even the spoilsmen of his party recognized the folly of trying to make him undo his predecessor's work. In point of fact, he extended the system by material additions to the classified service during his first term. Mr. Harrison was not in warm sympathy with the reform, as he showed by suspending Mr. Cleveland's too-long-delayed order regarding the railway mail service; but he had been elected by too narrow a margin to render it prudent for him to take the back track any further then, and before the end of his four years he had been so far converted to a belief in the new system as to make some extensions of it. When Mr. Cleveland was elected the second time, everybody knew that the only steps taken in this matter would be steps forward.

The crucial test came with the accession of Mr. McKinley. During the last year of his second term Mr. Cleveland had made wholesale additions to the classified service, until substantially all the places in the whole civil service, except the small post-offices at one end and the most important positions at the other, were removed from the reach of the spoilsmen. The professional politicians in the Republican party had never sympathized with the reform, nor intended to live up to platform pledges that it should be extended. They only awaited a favorable opportunity to attempt its betrayal. The overwhelming majority for the Presidential candidate of their party last fall, and the well-known disposition of that candidate to yield to importunity, seemed to bring the man and the hour together. So confident were Gen. Grosvenor and other notorious spoilsmen that they would have their way at the White House that they had the Ohio Republican State convention, a month ago, adopt a resolution that "we denounce the vitiation of the spirit of the civil-service act by President Cleveland in those orders which extended its operation beyond its purpose and intent, and demand such revocation of orders or modification of the law as will accomplish its manifest purpose."

The assurance of the spoilsmen that they would carry their point was confirmed three weeks ago by an extraordinary announcement in the chief Republican organ of the country. The Washington correspondent of the New York *Tribune*, explaining that he made his statements "on authority," declared that the President would, "on or about the 20th of the present month," make important modifications of the civil-service rules, in order to "correct the partisan work of the late Administration in reference to certain inclusions in the classified service." These corrections, according to this "most important authoritative statement," were to exempt from competition the thousands of employees in the Government Printing-Office; deputy collectors, and other minor employees of the internal revenue service; the sub-officials and employees of federal marshals and district attorneys; and probably also "the chiefs of divisions and chiefs of bureaus and so forth."

Mr. McKinley had made so many surrenders in other matters that the *Tribune's* proclamation of his intention to yield here did not seem incredible. The attitude of the Ohio Republican convention, presided over by Grosvenor, one of the President's intimates, and absolutely controlled by Hanna, his next friend, had already aroused serious apprehensions. But the friends of the merit system resolved to utilize the fortnight of grace which the ostensibly "inspired" despatch allowed, to enter the most earnest protests and arouse the public sentiment of the country.

Whether the President ever intended to do what his chief organ "authoritatively" declared was his purpose, will probably never be known. Nor is the question any longer of importance. The vital point is that Mr. McKinley has not only refused to make the wholesale exemptions from competition which were threatened, but has brought a large number of new places within the classified service; while as to the few dozen places withdrawn, properly enough, from that service, he has ordered that examinations shall still be required equal to those held by the Civil-Service Commission for places of like grade, and that these examinations shall be conducted by the Commission. Most important of all, he has amended the rules so as to provide that "no removal shall be made from any position subject to competitive examination except for just cause, and upon written charges filed with the head of the department or other appointing officer, and of which the accused shall have full notice and an opportunity to make defence."

The President, then, has not only successfully resisted tremendous "pressure" to take a long step backwards, but has advanced further than the most sanguine reformer dared to expect. The executive orders of July 28, 1897, assure the stability of the merit system beyond possibility of further dispute, and will reflect enduring credit upon the President who has thus rendered a public service of signal advantage to the nation.

FOSTERING THE BEET-SUGAR INDUSTRY.

The *Tribune*, by an editorial in a recent number of its weekly edition, gives this bit of encouragement to the farmers of the United States:

> "Two years of war have almost destroyed the cane-sugar industry of Cuba, and an Imperial Commission is holding what seems much like an ante-mortem inquest upon that in the British West Indies. At the same time the beet-sugar industry in the United States has been greatly developed, and, under the energetic encouragement of the present Administration, bids fair to continue its growth at an accelerated rate."

What is this "energetic encouragement" of the present Administration? Is it the President's message asking $50,000 for suffering Americans in Cuba, which gave such joy to the Jingoes who seek to annex that cane-sugar factory? Or is it the proposed annexation of Hawaii, which will be fearfully irrevocable? To invite or advise or encourage the American farmer to embark his hard-won earnings and savings in a beet-sugar venture, and then to overwhelm his little craft with cane-sugar made by millionaires, assisted by coolies and "Japs" and cheap Portuguese, and cheaper natives, is that fair or honest? What is it but to invite the farmer to his own insolvency?

For what is Hawaii? Hawaii, economically speaking, is sixty millionaires. They constitute the capital, the business, the brains, the state. Report says that forty-five of them are Europeans and only fifteen Americans; or it may be that forty-five are Americans and only fifteen Europeans. But the matter of nativity is immaterial. In the eye of the present Administration, "a millionaire's a millionaire for a' that." If forty-five, or fifteen, were not born in America, it is their misfortune and not their fault. Besides these sixty millionaires, there are a few other people. But it is easy to demonstrate by elimination that **they have no part in the love and esteem of the present Administration.** There are 25,000 Japanese. **The present Administration respects the Japanese in a way—that is to say, when they are safe and sound and at work in their** own country; but it is sternly opposed **to their coming into America or its dependencies, or to their doing anything if they should chance to be here or there. There are 22,000 Chinamen,** coolies at that. **What the present Ad-**

ministration thinks of Chinamen in general and coolies in particular is patent—everybody knows it, we need not dwell upon it. The worst enemy of the Administration will not say that it is trying to annex Hawaii for any love it bears towards these 47,000 "Japs" and coolies. There are 15,000 Portuguese. They are, figuratively speaking, white men; but they are cheap labor, and very low-down cheap labor—almost as cheap as the coolies. President McKinley surely cannot love them, much less can he desire to set them up in the business of making sugar, duty free, in competition with our own native beet-sugar industry. No, they must go out by elimination. There are 40,000 Hawaiians, full-bloods and half-breeds. The President, it is believed, once cherished a warm affection for these Hawaiians, but now they are known to have base monarchical proclivities with a hankering for a ruler of their own race, and a growing prejudice against sugar kings, English, German, and American. Moreover, it is suspected in Washington—it is, indeed, believed there—that their respect for Christian civilization has dwindled during the last dozen years. We must, therefore, cancel all of the red races! And there remains what? 8,400 white people of different nationalities and sixty millionaires!

But these Hawaiian millionaires, or sugar kings as they are sometimes called, are not absolutely unknown to the American Government. Some years ago they obtained from us a treaty whereby Hawaiian sugar—that is to say, their sugar—came into this country duty free, while the sugars of all other peoples paid duties. These duties, so remitted on Hawaiian sugar, amounted in round numbers to $60,000,000—a million per capita for each millionaire—when a Republican Congress put sugar upon the free list, and, in lieu of protection, substituted direct bounties to be given to American sugar-growers. It was then speedily discovered in Hawaii that annexation was the direct route to the American sugar-bounty system. That system has now gone by the board, and the financial necessities of the time have compelled us to restore the duties on sugar; and all students of finance, such as Mr. David A. Wells, regard sugar as one of the articles of importation best able to bear an import tax—as one which cannot be smuggled in, as one which cannot evade the revenue, as one which enters into general consumption, etc., etc. So it is not unlikely that a tariff on sugar will continue for many years to come.

The Hawaiian millionaires, however, have not been caught napping. Before the sugar duties were definitively established by Congress, the treaty of annexation was negotiated and signed and sent to the Senate for ratification. Under the new tariff, it is computed that the duties on Hawaiian sugar, if it should be made to pay duties, would amount to from $8,000,000 to $12,000,000 a year. In other words, the present Administration, with its eyes open or shut—probably with them shut—is binding the Government to pay bounties, amounting to at least $8,000,000 a year, upon Hawaiian sugar, to these sixty Hawaiian millionaires. Can the American sugar industry stand up against such favoritism as that? Can the Secretary of Agriculture fight successfully for home-grown sugar against such odds as these?

We observe that Count Okuma, the Japanese Minister of Foreign Affairs, who seems to know as much about Hawaii and American sugar culture as the present Administration, has just brought into view the unpleasant facts that of the 8,400 white people proper in Hawaii only 3,000 or thereabout—men, women, and children—are Americans, while the number of persons in America engaged in the culture of cane, beet, sorghum, and other sugar is 150,000. The Japanese statesman perceives clearly the effects of annexation; so clearly that he can ascribe but one motive to the present Administration. He says, in an explanatory way, that a duty on Hawaiian sugar will of course protect 150,000 American sugar-producers, but that it would be at the expense of the vast body of consumers in America; and therefore it is, he infers, that we are trying to avoid that "calamity by means of annexation." It takes one's breath away to hear protection to an infant industry spoken of as a "calamity," and to be told that the present Administration is trying to evade the "calamity" by throwing the loss upon 150,000 American sugar-producers. This supposition of bad faith we do not countenance. The trouble is that the millionaires know a great deal too much for the President. It really seems as if he cannot exchange the courtesies of the morning or the compliments of the season with a millionaire without the latter's immediately turning round and making money out of the civility. But the consequence of their sharpness and smartness and of the President's amiable credence is that we are now in this evil plight—that we are about to stab the beet-sugar industry under the fifth rib, and bring loss and disappointment and bitterness upon 150,000 American sugar-producers, and pay a bonus of $8,000,000 a year upon Hawaiian sugar to the end that the Government of the United States may acquire title to 25,000 Japanese, 22,000 Chinamen, 15,000 Portuguese, 40,000 native Hawaiians, and 8,400 white persons. That the United States will thereby become the owners of the sixty millionaires, we do not believe. On the contrary, it seems much more likely, as things are going, that the sixty millionaires in a reasonable time will become the owners of no inconsiderable part of the Government of the United States.

CANADIAN PROSPECTS.

To determine the policy of so remarkable a concatenation of petty states as makes up the Dominion of Canada has been no simple task. The territories occupied by these states are connected by nature with our own land, and it was by accident that this natural connection did not result in a community of government. So far as human happiness is concerned, the difference might not have been great had the policy of the United States been more liberal. For a number of years, under the reciprocity treaty, commerce between the two countries was not oppressively restricted, but since the repeal of that treaty our policy has been to discourage trade with Canada, and to create artificial barriers to intercourse where nature had removed them. The United States, therefore, forced the Canadian colonies to combine in self-defence, and in this way compelled them to undertake very comprehensive schemes for intercolonial communication. As the United States had built the Union and Central Pacific Railways in order to hold California in the Union, so the Dominion of Canada was obliged to construct a railroad to British Columbia, and another to Nova Scotia, for the sake of consolidating its diverse elements. Immense sums have been spent on these enterprises, in the construction of canals, and in subsidizing lines of steamships. Very heavy burdens have in this way been imposed on the people, and the debt increases year by year. It is now more than $250,000,000, and the annual expenditure is probably about $32,000,000. The Intercolonial Railway is said to have cost more than $55,000,000, and the accumulated deficits from its operation exceed $6,000,000. Nevertheless, it must be said that the credit of the Dominion is extremely high, so that its interest charges are moderate, and that its public works are not altogether unproductive of revenue.

Thus, by force of circumstances and by deliberate choice, the trade of Canada was determined to be a foreign trade. The United States raised barriers against the natural course of trade, and the Canadians removed the barriers to the foreign commerce which was all that was left free to them. But, with a most perverse folly, they proceeded to build other barriers in their places. They dug canals and built railways and subsidized steamships in order to increase their foreign commerce, and then they clapped on protective taxes in order to diminish it. The consequences were what might have been expected. Foreign commerce increased very little, while the protected manufacturers made but a sickly growth. The vast system

of transportation seemed to have been created after all principally to enrich a few unscrupulous speculators and politicians, and to be more of an incubus than a benefit to the country.

The recent success of the Liberal party has greatly changed the situation. It is, under Sir Wilfred Laurier's leadership, a free-trade party, and this at once makes it possible for the Dominion to adopt and pursue a rational and consistent policy. Whether state aid to railroads and steamship lines is wise or not, it is unquestionably the part of wisdom to lay no obstacles in the way of the traffic to facilitate which so much money has been spent. Very properly the Canadian Government has endeavored to reach some understanding with that of the United States whereby the natural avenues of commerce might be thrown open. Had this result been accomplished, the great Canadian transportation lines would have been deprived of much of their importance, but the gains would have far outweighed the losses. The United States, however, persisted in its hostility, and the Canadian Government at last took the decisive step of reducing the tariff on importations from England. It was not a long step—only a reduction of 12½ per cent. this year and as much more the year following. Yet it may have momentous consequences.

In the first place, it puts an end to the hopes of the protectionists, both in England and the colonies, that an imperial customs union might be formed on protective principles. Mr. Chamberlain silently gives up these hopes; Sir Charles Tupper cannot refrain from wailing an imprecation as he sees them dashed. The *post hoc, ergo propter hoc* argument, which is enough for most people, happens at this juncture in the United States to count in favor of protection. In Canada, happily, it will count the other way, and, with so much prosperity as now seems reasonably assured, the new tariff is likely to remain in force until the results become understood and appreciated. Trade with the United States will suffer, but trade with England will improve, and the history of that Power shows that freedom from legislative meddling may be a greater stimulus to trade than natural advantages. Mr. Goldwin Smith points to the map, and conclusively demonstrates the folly of separating Canada from the United States. Separation, however, has become our settled policy, and the commercial union with England which we have forced on Canada will grow closer and stronger as years go on.

What is of greater consequence, the action of the Canadian Government will tend to revive the cause of free trade. Its immediate effect has been somewhat paradoxical, England having been obliged to notify Germany and Belgium that her treaties with them would be terminated. The Canadian Government does not see how revenue is to be insured if it reduces duties generally, and it proposes, for the present at least, to limit the reduction to countries admitting Canadian products free, which, under the present treaties, would involve a reduction on German and Belgian products. These treaties, however, have nothing to do with the theory of free trade. That theory contemplates the abolition of protective duties, and, as a matter of fact, Canada has partly abolished them. She has not carried the theory out, but she has made a beginning. There is ground for hope that, when the example of her colonies has been added to that of England, the other nations of the earth may at last be convinced that their policy of reciprocal injury is a survival of barbarism.

THE NEW SAYINGS OF JESUS.

Great interest was aroused among Biblical critics when, some months ago, a telegram was sent to the British Museum from Egypt that a papyrus fragment had been found containing hitherto unknown sayings of Jesus. These have now been published in facsimile, and are seen to consist of eight different *logia*, or sayings, some of them overlapping words attributed to Jesus in the canonical Gospels, and others entirely new. It is too soon to say whether critical opinion will decide the fragments to be authentic. There is no higher authority in such matters than Prof. Rendel Harris, and he accepts the authenticity as almost unquestionable; so does Prof. B. W. Bacon of Yale. But, quite apart from these nicer questions of technical scholarship, there is much in the discovery, and in its reception by the Christian world, to excite remark.

For one thing, it is an extraordinary vindication of the much-reviled higher criticism of the New Testament. One of the conclusions of that criticism has long been that the synoptic Gospels derive from a common original source now lost. A clear and convincing exposition of the grounds for that belief may be seen by going no further than the article "Gospels" in the 'Britannica,' by Dr. E. A. Abbott. In fact, critics had come to speak familiarly, using a phrase of Papias's, of *logia* of Jesus—collections of short, pithy savings—as having been indubitably in existence and made use of by the writers of our Gospels. They based this on internal evidence. No such collection, or even a fragment of such a collection, had ever been found, and conservative theologians had scouted the whole theory and predicted that nothing of the kind ever would be discovered. Well, here is the Egyptian papyrus to justify the critics. Even if it be decided not to be authentic, it points necessarily to the actual existence of *logia* which were authentic. No forged or heretical collection could have been set circulating unless there were genuine ones with which it might hope to be confused. The discovery, therefore, establishes the scientific validity of the New Testament higher criticism beyond cavil. It is only a valid science that can predict the unknown; and this Egyptian find of Messrs. Grenfell and Hunt does for the methods of the New Testament critics what the discovery of Neptune did for Leverrier's mathematics—establishes them as incontrovertible.

The calm, not to say indifferent, reception of the discovery by the theological world, by the organs of religious opinion in general, is a thing to make people with memories rub their eyes. It would not have been possible fifty, or even twenty-five, years ago. We should have had hasty champions rushing forward to declare the whole affair incredible, an invention of the Evil One to try the faith of the elect. The solemn threat of the Scriptures against any man who should "add unto the words of the prophecy of this book" would have been levelled at the audacious discoverers and publishers of the *logia*. But things have changed, even with those who vow that they have not changed. It is not simply the growth of tolerance that makes the difference; it is the growth of knowledge. Many things have combined within the past twenty years to popularize information about the real nature of the Bible. There was the Revised Version, which led many Christian people to hear for the first time of manuscripts and texts and versions and variants and interpolations. The result could not have been other than a serious shock—all the more serious because silent and unperceived—to the old idea of the sacrosanct character of every word and letter in our English Bible. Then there was the remarkable recovery, a few years ago, of the "Teaching of the Twelve Apostles"—a discovery illustrating the lost riches of the early Christian era, and naturally arousing hopes of unearthing more such treasures. Thus the finding of the *logia* has come to a Christendom prepared for them, as it were. Instead of surprise or alarm, the uppermost feeling of the Christian world seems to be an ardent hope that investigation may be pushed, and others of the lost *logia* brought to light. This result is gratifying in every way.

Let no one suppose, however, that the discovery is going to make any immediate change in the current Christian theory of the Bible. Not even the defenders of a slavish verbal inspiration will abate one jot of their claims; they will rather find new support for their doctrines in the discovery, just as they have in every other argument or fact that seemed to make dead against them. Theological theories and ecclesiastical prejudices have an astonishing power of bolting inconvenient facts whole, and it

will not fail to be applied to the new-found "sayings." Catholic and Protestant, High and Low Church, Reformed Episcopalian, Pre-Millenarian and Antipedobaptist will each find in the new evidence the one thing that was lacking—if anything at all could be conceived lacking—to make his view irrefragable. We shall see plenty of this instinctive theorizing, whence the fact looks to the eye as the eye likes the look.

But no one, we think, can consider the discovery of the "sayings" in a large and dispassionate way without seeing that it really makes for the confirmation of the Gospels. In the case of any other narrative, the coming to light of the material upon which it was based would be hailed as a ground for renewed confidence in it, and so it will doubtless be, broadly speaking, with the Gospel narrative and its sources. Nor can it be thought any derogation from the Founder of Christianity that he made "current coin," to use Tennyson's phrase, of many more "truths of manhood" than find record in the canonical Gospels; indeed, to suppose that he did not would be to deny what one Gospel expressly asserts. The fact is that the essentials of Christianity are now beyond being moved from the rock on which they are built by any antiquarian discovery that can be imagined. This is not meant in any mystical or Hegelian sense, but is only to say that the truth and beauty of the life and teachings of Christ have so commended themselves to the minds and consciences of men, have become so inwrought with the whole complex of modern civilization, that they are practically independent of external evidence. In this sense Browning's prophecy, in "A Death in the Desert," is already fulfilled, that

"He will grow incorporate with all."

THE YUKON GOLD FIELDS.

OBERLIN, July 29, 1897.

For a long time it has been known that the general geological features connected with the production of gold in the western portion of the United States extended through the western part of British America to the upper Yukon district on the eastern border of Alaska. For more than forty years a continual stream of gold has been coming out of the region drained by the upper portion of Fraser River; while early in the seventies it was discovered in large quantities about the headwaters of the Stikeen River, which enters the Pacific about latitude 57, and of Dease River, which, rising west of the Rocky Mountain chain, flows eastward from near the same latitude to Mackenzie's River. The headwaters of these two streams are in the same broad valley which, north as well as south, separates the Rocky Mountain from the Cordilleran chain that here forms the continental border of British Columbia. From the Cassiar mines at the head of Dease River $1,000,000 of gold was taken out in 1874, the second year after their discovery. The next year the product was nearly as much; but from that time it has gradually decreased, until now the mines are nearly abandoned. Upwards of $5,000,000 worth of gold has, however, been added to the world's stock of gold from that region.

Northward, this broad valley includes the headwaters of the Taku River (which reaches tide near Juneau), and extends without interruption to the headwaters of the principal tributary of Lewis River, which is the real continuation of the Yukon. This elevated valley is the one partially surveyed forty years ago for the trans-Siberian telegraph route, and more lately for a railroad through British territory to the Yukon district. The railroad company recently organized in Delaware to reach the new Eldorado proposes to utilize this plateau through the Taku River. From the reconnaissance of the region made in 1891 by Lieut. Schwatka and Dr. Willard Hayes of the United States Geological Survey, it would seem that this route would be entirely practicable, for summer use at least.

As early as 1887 the explorations of Dr. George M. Dawson and Messrs. R. G. McConnell and W. Ogilvie of the Canadian Geological Survey demonstrated the continuation of the geologic conditions favorable to the production of gold through the Yukon district as far as the sixty-sixth parallel. Commenting upon the formations near the mouth of the "Tatondac" (the old name for Klondike), Mr. McConnell said at that time:

"The schistose beds alternate occasionally with limestone bands, altered in places into marble, and are traversed in all directions by quartz veins. They are exposed all the way to Forty Mile Creek and beyond. They are of the greatest economic importance, as they constitute the gold-bearing rocks of the district, and are on the strike of the same metalliferous zone on which Cassiar and other principal mining camps to the south are situated, and which has now been traced northward across Canadian territory from the forty-ninth parallel to the eastern boundary of Alaska, a distance of fully twelve hundred miles."

But the prospectors had been in this region before the geologists, and 200 miners were already at work there in 1887, and had sent out more than $100,000 worth of gold in a single year from Forty Mile Creek; while the previous year the Stewart River region, a little farther up in the Yukon valley, had produced $100,000. Indeed, according to Dr. Dawson's report, gold was to be found along almost any of the eastern tributaries of the Yukon from the international boundary to its source. But the expense of working the "bars" was such that unless one could get more than ten dollars a day it was not worth while to bother with them. The Governor of Alaska reported 1,000 miners in the Yukon district in 1893 and 1894.

In estimating the significance of the fabulous success which has attended the miners in that region the past year, it is important to consider some of the drawbacks and hazards of the situation. Placer mines owe their richness to the accumulation of ages. The mills of the gods, though grinding very slowly, have been at work for incredibly long periods of time. On an average, subaerial agencies are wearing down the surfaces of the continents at a rate of a foot in about 3,000 years, while the mountains and the river valleys are wearing away much faster. It is not too much to believe, therefore, that thousands of feet of rocks in the upper Yukon basin have been dissolved by subaerial agencies, and their soluble and lighter portions carried away to the depths of the sea by the mighty current of the river. Even the quartz is ground to powder and borne away by the ever-recurring floods in the innumerable streams. Gold is seven times heavier than gravel, and, therefore, settles to the bottom of the gravel beds into which it is washed.

From this it can readily be seen how deceptive a rich placer mine may be as to the richness of the quartz vein from which it is derived. A small yield to the ton amounts to a great deal if a large amount is crushed and separated. For example, the Treadwell mine, near Juneau, yields but three or four dollars of gold to the ton, but the vein is very wide and rises directly from tide-water at the base of the mountain, which furnishes water-power in abundance. Everything, therefore, is present to insure the greatest economy in working. The quartz ore is stripped off from the surface of the mountain at a moderate elevation, from which gravity carries the cars to the top of the mill, where water-power from the same mountain drives the stamping machinery, allowing the product to descend of its own weight to the basement, where the waste is dumped into the sea. With such economy in working the mill, a very low-grade ore can be made profitable. The million dollars a year turned out from the Treadwell mine is largely profit. But were this vein transferred inland for a few miles, especially in that rugged region, the cost would easily more than equal the returns. As there is every evidence that enormous glaciers have ploughed their way through the channel which passes Juneau, it is evident that nature has crushed and "milled" more of this quartz vein than man will be able to do in centuries, with all his labor-saving appliances. If, therefore, we could explore and utilize the depths of the Alexander Archipelago and bring up its buried treasures, there is no telling what riches we should find.

While the accumulated gravels spread out on the flanks of the mountains of California and of the Yukon region afford man an opportunity of penetrating some of the great storehouses of nature's workshop, the above illustration shows how futile may be the effort to find the "mother lode" from which the accumulations have come. For, even if found, it may be of such low-grade ore that it would be unprofitable to work it under favorable conditions, to say nothing of the futility of working it where the miners think a placer which does not "pan out" more than ten dollars a day is too poor to look at.

The inaccessibility of the Klondike region must long preclude it from yielding its full resources. Entrance by way of the Yukon River involves a hazardous journey on that stream of nearly 2,000 miles from its mouth, which can be made only from June to September. To attempt this voyage a week too late in the fall means certain destruction. All the means of subsistence must be carried into the country, for its natural resources of food are exhausted by the few hundred natives that have heretofore occupied it. Moreover, the placer mines are not directly on the Yukon, but many miles back from it on the tributaries. So difficult is this part of the transportation that dogs of burden bring a price of from $100 to $200 apiece. One of the articles of greatest pro-

fit for the hardware merchants of Seattle in fitting out the Alaskan miners for the last three or four years has been these Eskimo dogs, of which each man needs two or three.

The nearer way by the Chilcoot Pass is at present no less formidable. Here, after wending one's way up the precipitous trail on the south side, rising four or five thousand feet in a few miles, the path leading over enormous piles of débris and across numerous glacial streams, the pilgrim finds himself, when at the top, five hundred miles from the mines with a tempestuous mountain torrent to navigate in its downward course to the far distant sea. It is no wonder that wages are cheap in the Klondike region at fifteen dollars a day. The bare means of subsistence will cost nearly that. But woe to the inconsiderate multitudes that get into the trap this fall without a sufficient supply of food and clothing, for during the winter they are beyond reach by any means at the present command of the civilized world. After a year or two, however, many of these difficulties can be removed and many of the contingencies provided against. A sufficient force of boats may be put on the Yukon to transport all that is needed during the short period of navigation. The Chilcat Pass and the White Pass, which are nearly parallel with the Chilcoot Pass, while a little longer, are more favorable to the construction of a trail for pack-animals to the navigable portion of the Yukon, or the Lewis, as it is there called. If the present productiveness of the mines continues, even the railroad by way of Taku Inlet may be built, and operated a portion of each year. But, in any event, the cost of overcoming the difficulties of transportation of large supplies to the region must be enormous.

The most hopeful outlook is in the introduction of reindeer, a beginning of which has already been accomplished. Through the energy of Mr. Sheldon Jackson, 500 reindeer have been imported by the Government from Siberia into the lower Yukon region, and with them several Lapland families to care for them. The flocks have already increased in the natural manner to more than 1,000, and the natives are learning to care for and manage them. An experiment is being made of using them for transportation in the mining country. Indeed, the introduction of reindeer into Alaska is one of the most philanthropic and hopeful enterprises of the century. The Government has moved none too soon in the matter, and should greatly increase its efforts in that direction. Unlike the dog, the reindeer needs to have no food transported for him. After an eighty-mile drive he can be turned loose to forage for himself upon the abundant reindeer moss which covers all the Alaskan fields. When it is necessary to kill him, he furnishes better meat than the dog and more of it, while his skin, and, indeed, every portion of his body, is of superior value. Commissioner Harris estimates that Alaska is capable of supporting many millions of reindeer, and with them a proportionate number of keepers with their families. The civilization of Lapland is therefore in a fair way to be transplanted to our northwestern province, and may serve as a most important connecting link with the great mining interests of the upper Yukon valley. The reindeer express up the Yukon will be almost as fleet as, and far more sure than, the steam-cars could be during the inclemency of an Alaskan winter.

In addition to the inaccessibility of the Klondike region, the temperature is extreme both in summer and in winter. A year ago the reported variation of the thermometer was from 60 below to 103 above zero. The mosquitoes of the country are also more formidable than those of any other region of the world from which reports have come. Schwatka affirms that even the grizzly bear succumbs to the vicious attacks of the Alaskan mosquito. And it can easily be believed, for when Bruin comes out of his lair to feed upon the succulent food of the valleys in summer, these pests swarm around him and feast upon the blood of his eyelids until, in his desperation, he claws his own eyes out in vain endeavor to rid himself of them; thus, like blind Samson, compassing his own destruction in securing that of his enemies.

In forecasting the future of the gold product from this region it should not be forgotten that the returns have been far slower in coming in than they were from California. The California discoveries were made in 1848. Within two years from that time more than twenty millions had been secured. There has been no such rapid work in the Yukon district. Probably it is because there is no such general distribution of rich placers. Nor should we be too enthusiastic over the occurrence of occasional large nuggets of gold. Many years ago a nugget of gold weighing twenty-eight pounds avoirdupois was found in North Carolina, and others of equal weight have been found in regions which have not been specially productive. The goose that lays such golden eggs, though a rare bird, has wandered widely over the world.

A word should be added about the new names appearing in the abundant literature that is springing up. "Klondyke," as already remarked, is the new way of pronouncing "Thronduic," or "Tondak," which means plenty of fish. It is marked Tondak, or Tatondac, on the maps. The word Deï-a is the same as was formerly spelled "Tayay" or "Dayay," the name of the inlet above Chilcoot which has led to the favorite pass into the headwaters of the upper Yukon. The Chilcat Pass branches off to the west from this, and the White Pass to the east; but all three meet about 100 miles beyond. Schwatka's report still gives the most minute information concerning this route.

G. Frederick Wright.

ELECTRICITY FROM DUST DESTRUCTION.

London, July 27, 1897.

The horn of Shoreditch is exalted. To use what passes for an Americanism on this side, she has licked creation. And this is how she has achieved that proud eminence.

Shoreditch forms a London parliamentary borough on the north side of the Thames and in the East Central District. It has an area of one square mile and a population of 124,009, with the largest proportion of artisans of any London borough, viz., 35 per cent. Shoreditch is therefore poor. To the impartial eye it has rather a grubby and frowsy appearance, as of one not addicted to the use of the bath, and indifferent to the high sense of morality conferred by clean linen and hygienic surroundings. But, on the other hand, Shoreditch has proved herself not only up to date, but capable of setting the pace municipal.

On one of the last days of June, Lord Kelvin, our greatest living scientist, travelled to Shoreditch, spoke all these and many other handsome things of the borough, and formally declared open the Combined Electricity and Dust Destruction Undertaking, the object of his visit to the wise East. In consequence of Jubilation and the resulting dislocation of business, it was exactly three weeks before I could follow Lord Kelvin's example and inspect the C. E. and D. D. U. What I saw is well worth a brief description. The first claim of Shoreditch to universal admiration is that she had the sense to elect wise stewards of that which is committed to their care, and that the vestrymen chose a capable clerk, Dr. H. Mansfield Robinson, to conduct their affairs. Many an electric-lighting company had wished to light up Shoreditch, for, as already said, its area is but one square mile, its population is dense, many of the people requiring a light motor for the staple industry of the borough, furniture and cabinet-making; besides, public-houses abound, to the number of 300, and they are the great consumers of electricity until a very late hour (12:30 P. M.), although many other small shops successfully rival their bad example.

But Shoreditch resisted the wiles of electric-lighting companies, and in 1892 obtained the consent of the Board of Trade to furnish its own electricity for public and private purposes. Other English corporations—to wit, Bradford, Brighton, St. Pancras—have produced their own electricity, and have calmly put the profits of monopoly into the municipal pocket. But it was reserved for Shoreditch to produce electricity from dust—"E pulvere lux et vis," as the corporation now proudly boasts. Shoreditch produces daily between fifty and sixty tons of dust and house refuse, and for the removal of this to the sea by barging it used to pay 3s. 2d. per ton. The problem for the municipality was to burn the dust to make electric light, and, incredible as it may seem, this is what is being done to-day. The whole municipal world is agape with admiration. Every day visitors come from the most remote local bodies, and depart determined to do likewise. Out of that dust, the destructor produces steam, and the steam is used to drive a great high-tension engine producing 1,100 volts of electricity from each of three generators; there are, besides, three low-tension dynamos, each producing 165 volts. One would like to say that the electric-lighting station is handsome, but truth compels the admission that it is more utilitarian than elegant. However, it is respectable, and it ought to be chronicled that the site, which also serves for baths, wash-houses, Central Library, Museum, and is very close to the municipal technical school, cost £33,500. The total cost of these different schemes is very nearly £200,000.

Naturally the complete scientific description of this undertaking belongs to an engineering paper. But the main outlines of the scheme are well within the grasp of the unscientific mind. Between fifty and sixty tons of refuse are brought to the Dust Destructor daily, and tipped from the carts into lifts. These are moved by electricity up to the tipping platform, run on rails and emptied into bins from which the furnaces are fed. There are twelve destructor cells, or furnaces, with the large heating

area of twenty-five square feet each, and also six water-tube boilers at the side, each with 1,300 square feet of heating surface. Now it is evident that dust and refuse will not burn as coal burns. To coax it to burn, there are motor-driven fans which cause a strong current of air to circulate. Each fan makes from 500 to 700 revolutions per minute. The hot air is drawn by suction from the top of the engine-house, forced into an air-duct by the fans, and goes underneath the cells and boilers to compel the refuse to burn. The air-supply is carefully regulated by valves, so that in case of coal or other easily burning fuel being used, it can be cut off. It was evident that dust is collected and preferably burned in the daytime; whereas night is the great time for using electricity. Dust destruction continues day and night at Shoreditch, twelve men stoking in three shifts of eight hours each, four to a shift. The question was, how to save up the steam generated in the daytime for use at night. This has been achieved by the Druitt Halpin thermal storage system, by which steam passes into a cylinder and is mixed with a small quantity of cold water from the feed-pumps. This steam is supplied to boilers in connection with the dynamos, and by this arrangement the boilers evaporate one-third more steam than would be the case if they were connected with the water-mains.

There remains to consider the waste product of the refuse, which is reduced to about 30 per cent. of its original bulk. At present it is given away; but there is little doubt that a market will arise for it. It can be ground down to make good sand for mortar of excellent quality for bricks, for artificial paving-stone, concrete, and also for drainage and road-making before macadam is laid down. The Shoreditch vestry are at present considering the advisability of grinding the ash and using or selling it themselves as a subsidiary industry. There is absolutely no coal used in the destructor cells, nothing but refuse. Lord Kelvin, for my benefit, calculated that from five to ten tons of dust is equal to one ton of good steam coal; some dust is full of cinders, especially in winter, and is better for cremation purposes than summer dust. The vestry clerk calculates that, in view of the large sum formerly paid for the barging of the dust, the saving of fuel for the baths and washhouses, and the receipts by the sale of electricity, there will be an annual economy of £1,500. This is probably much below the mark. For the purposes of your journal, the vestry clerk communicates the fact that all the electricity the machinery can now yield is taken up, and no fresh customers can be supplied until more machinery is added. Additional engines and gear are now being built.

The electric-lighting station supplies the arc lamps with which Shoreditch streets are now lighted. At midnight these are switched off, and by automatic action incandescent lamps of less power are lighted until dawn. In case of accidental extinction of one set of lamps, the other set will light automatically. The station also lights the town-hall, lights and heats the baths and technical school, ventilates the sewers, supplies electric motor-power to cabinet-makers at specially low rates during the day-time, has entered into a contract with the Electric Cab Company, and supplies every private consumer, dealing tenderly with him in the matter of fittings. It is good to know that workmen's dwellings are being fitted with the Bastian penny-in-the-slot meter; for a penny the poorest home can have an eight-candle-power light for six hours. And, delightful thought, all this light is churned out of dirt!

It is, perhaps, fair to state that at Southampton there is a small thirty-horse-power engine worked by steam generated from the burning of refuse; but, naturally, this is on an insignificant scale. Shoreditch can undoubtedly claim the honor of being the pioneer municipality in combined electricity and dust destruction. C. S. BREMNER.

Notes.

Dr. Alexander Brown, author of the important work on the planting of North America by Englishmen (1605-1616) entitled 'The Genesis of the United States,' and published in 1891, invites subscriptions to a companion work, 'The First Republic in America' (1605-1627). This relates to the colonizing movement in the period last named, and about a third of its contents is largely a digest of the earlier narrative, yet embraces a good many contemporary documents discovered in the meantime; for again Dr. Brown has resorted to original sources, and writes not at second hand. 'The First Republic' will make an octavo volume of 550 pages, and will be elegantly manufactured by Houghton, Mifflin & Co. as soon as 350 subscribers (at six dollars) are obtained. Subscriptions may be addressed to the author at Norwood P. O., Nelson County, Virginia.

'The Old Santa Fé Trail,' by Col. Henry Inman, late of the United States Army, and 'Singing Verses for Children,' by Lydia Avery Coonley, with music and illustrations, are in the press of Macmillan Co.

Thomas Whittaker will issue next month a one-volume edition of Boswell's Life of Johnson, supervised by Percy Fitzgerald, and accompanied by a biographical dictionary of every person mentioned in the book.

Mr. Henry Farrar's 'Index to Marriages in the *Gentleman's Magazine*,' of which the first portion extended from 1731 to 1780, inclusive, is about to be finished to 1868. The edition is limited to 250 copies, and subscriptions at a guinea a volume for four volumes should be addressed to Swan Sonnenschein & Co., Paternoster Square, London. Only seventy-five copies will be printed of the same diligent compiler's 'Index to Marriages in Walker's *Hibernian Magazine* 1771-1813,' with a supplementary index to births, marriages, and deaths in the *Anthologia Hibernica* 1793-1794. This will make two volumes at two guineas, and is promised for October. Subscriptions may be made as above.

Mr. Quaritch will publish, in a folio edition of 300 copies, facsimiles of a series of ninety-nine early Italian drawings representing scenes and personages of sacred and profane history, formerly in the possession of Mr. Ruskin and by him given to the British Museum. It will be called 'A Florentine Picture Chronicle,' and in the accompanying letterpress the designer will be identified by Mr. Sidney Colvin with Maso Finiguerra. The text will be itself embellished with well-chosen contemporary designs from various sources.

A popular Life of the great Elizabethan statesman, William Cecil, Lord Burleigh, is being written by Major Martin Hume for Nisbet & Co., the London publishers. Lord Burleigh's descendants, the Marquesses of Exeter and Salisbury, have promised Major Hume access to the archives preserved at Burleigh and Hatfield respectively. Major Hume is especially qualified for the work he has undertaken from his close acquaintance with Burleigh's era. His 'Courtships of Queen Elizabeth' has run into a fifth edition. He made a decided hit with his book upon the Armada, and his forthcoming volume upon Sir Walter Raleigh, for the "Builders of the Empire" series already in the publishers' hands, but "delayed by the Jubilee," will maintain his reputation as an entertaining and accurate historical writer. His ever-busy pen is now engaged, among other things, upon a 'History of Modern Spain' for the Cambridge University Press.

Mr. George R. Parkin, principal of Canada College, Toronto, is now in London seeing through the press a Life of Dr. Thring, the famous headmaster of Uppingham School, a kind of latter-day Arnold of Rugby. The family of Dr. Thring intrusted the work to Mr. Parkin, who, however, is best known as an ardent advocate of imperial federation. At one of the public dinners given to Sir Albert Milne before his departure for South Africa, the present Governor of the Cape stated that he had been much influenced, when a young man at Oxford, by the eloquent exposition of imperial federation made by "a young Canadian" to the University, meaning Mr. Parkin.

It is understood that little progress has been made by Mr. Frederic Harrison with his Life of William the Silent.

The Life of Tasman, the navigator, upon which Mr. Coote of the British Museum and Mynheer Heeres of The Hague have long been engaged, will not appear for some time, owing to Mr. Coote's engagements with other business. The Log of Tasman, which was discovered at The Hague, will form a prominent feature in the work of the two able authors.

Prof. Adolph Ernst, the Curator of the National Museum at Caracas, has recently been examining the records of British Guiana and of Dutch Guiana (Surinam), at the instance of the Government of Venezuela. Dr. Ernst is a German by nationality, but has been settled in Venezuela for thirty-six years. He is familiar with the Spanish, Dutch, and English languages.

The Year-book of the Massachusetts Society of Colonial Wars, in addition to lists of the members and their ancestry, contains Mr. A. C. Goodell's address at the celebration of the six-hundredth anniversary of the first representative English Parliament, and some interesting historical materials. These are the muster-rolls, etc., of the successful expedition against Port Royal, Nova Scotia, in 1710, as well as a journal of the expedition preserved in the Public Record Office, London, and now printed for the first time. This is followed by a curious list of "the names of the men belonging to the north regiment in Essex opoint[d] to keep snowshoes and mogginsons," and also a list of English prisoners in Canada in 1710, the larger part being from the towns of York, Wells, Exeter, and Oyster River. There is also a brief account of the unfortunate expedition of Admiral Sir Hovenden Walker against Quebec in 1711. The volume, which has several

illustrations and a portrait of the late Mr. H. O. Houghton, is unusually attractive in its typography and general appearance.

Mr. Hamlin Garland has earned the distinction of a uniform edition of his stories. A handsome set of four volumes, his 'Spoil of Office,' 'Wayside Courtships,' 'Jason Edwards,' and 'A Member of the Third House,' has just been issued by D. Appleton & Co.

A little volume, 'The Missions of California: Their Establishment, Progress, and Decay,' by Laura Bride Powers (San Francisco: William Doxey), will serve the cause the author has at heart, the preservation of the buildings of the missions. She writes agreeably and with ardor, and presents conveniently the leading facts about the several missions described and (for the most part) photographically shown. She does not always define the age of the present remains, or portray their condition, but says enough to excite a popular sentiment in favor of their preservation and restoration.

Mr. H. de B. Gibbins's 'Industry in England: Historical Outlines' (London: Methuen; New York: Scribners) will prove of great service to teachers of economic history and to students first attacking the subject. It is, indeed, so far as the greater part of its contents is concerned, hardly more than a compilation, chiefly from some eight or ten well-known writers; but, as a compilation, it is an excellent piece of work, methodical, thorough, and clearly written. In Mr. Gibbins the late Prof. Thorold Rogers has found almost his only quite respectful disciple; and though, with widening knowledge of his subject, Mr. Gibbins has lost much of the violence of expression and cocksureness of tone which he adopted from his master in his earlier writings, there is still a very visible bias to be allowed for. However, it is not difficult to make the allowance; and a little strong feeling certainly makes a book more interesting reading.

The Edinburgh professors of philosophy seem to be considerably exercised in their minds over the problem of teaching their fellow-men to know their place in nature, and otherwise. Such, at least, is the inference likely to be drawn from Prof. Andrew Seth's imitation of the title of Prof. Henry Calderwood's 'Man's Place in Nature.' 'Man's Place in the Cosmos' (Scribners) is certainly, as Prof. Seth acknowledges in the preface, a somewhat disproportionate, not to say turgid, title for a number of essays which discuss some of the chief literary events of the philosophic world during the last half-a-dozen years. In themselves Prof. Seth's criticisms are well enough; they are always unexceptionable in their tone and attitude, and sometimes even edifying, and the points made are sound in the main. But they are wholly critical, and make the reader feel more than ever that if Prof. Seth has anything original to say, he has yet to say it. Thus there may be two opinions on the question whether it was absolutely necessary that these papers should be gathered together and made into a book. For the rest, suffice it to say that the essay on Huxley's 'Evolution and Ethics' will be found the most interesting, and that on Mr. F. H. Bradley's jugglery in causing the "disappearance of reality" the most solid, while the quarter of the book devoted to a solemn defence of Mr. Arthur Balfour's brilliant *jeu d'esprit*, 'The Foundations of Belief,' constitutes an affecting tribute to gratitude and friendship.

Some articles by M. Pierre Leroy-Beaulieu descriptive of the English colonies in Australasia and South Africa have appeared within the last two years in the *Économiste Français* and the *Revue des Deux Mondes*, where they attracted attention, particularly because of the account they gave of the socialistic legislation of some of these communities. These articles have now been reprinted in book form under the title, 'Les Nouvelles Sociétés Anglo-Saxonnes' (Paris: Armand Colin & Cie.). The book is to be recommended to those who desire to understand the history of these colonies as well as their present condition. It contains much statistical information derived from official publications, and it also contains many pages of effective description of nature, as well as of man and his works in the regions under review.

The same firm has published the fifth volume of the 'Discours et Opinions' of Jules Ferry. The volume is perhaps the most interesting of the series, containing, as it does, the speeches on the Tonkinese policy of the Minister—a policy which excited such bitter opposition at the time. The Egyptian question has also its share of this volume.

M. Henri Weil gives us a volume of 'Études sur le Drame Antique' (Paris: Hachette & Cie.), well written and instructive. The author devotes considerable space to the Promethean legend, examines the lyrical forms employed in Greek tragedy, and the rule of the three actors in Seneca's tragedies. The book is worth reading.

The twenty-first instalment of Hatzfeld, Darmesteter & Thomas's admirable French Dictionary ('Dictionnaire Général') carries the work along towards its much-desired completion, as far as *panicule*. The Paris publisher is Delagrave.

If the voice of the German people could reach the ear of Emperor William, an open letter by Dr. Bruno Wagener, 'Kaiser, höre die Wahrheit' (Leipzig: W. Friedrich), would hardly fail to make an impression upon that autocratic ruler. The author and publisher of the little brochure were prosecuted for leze-majesty, but were acquitted by the courts on the ground of the author's "patriotic standpoint" and "honest intention." The writer appeals to the Emperor to become a *Volkskaiser*, instead of remaining a *Hof-* and *Parteikaiser*. His tone is respectful, but such frank advice and earnest warnings are, of course, very unconventional.

In the June issue of *Folk-Lore* is given Miss Mary H. Kingsley's paper on the "Fetish View of the Human Soul," recently read before the Folklore Society. Beginning with the suggestion that a committee of the society be formed for the consideration of African folklore, in view of the great practical usefulness of "a careful and unprejudiced study of African beliefs and customs," Miss Kingsley proceeded to touch upon the terms Fetish and Ju Ju as practically equivalent, the former being of Portuguese, the latter of French derivation. The African did not, she said, divide up the world into God, man, and nature. A vague pantheism underlay Fetish, a conception involving few or no distinctions of kind, wherein man belongs to a high order of spirits, but not to the highest order. Many orders are below him; and above him, beyond his absolute control, are two great classes, while the order to which he belongs contains a vast number of spirits coequal with men, and yet not of mankind. The religion of Fetish is a scheme of conduct and precaution to regulate man's welfare in view of these complicated hierarchical relations. It is compatible with the general West African belief in a Supreme Great God, who cares not at all for his creatures, and whom they do not formally worship, though sometimes, after all Fetish observance has been resorted to in vain, there is a desperate final recourse to him. A human soul is never promoted or degraded in the scale of being; it lives on after the body dies, but not for ever; it is constantly reincarnated. Finally, each individual man is regarded as having four souls. Perhaps one of these is the soul proper, and the other three are aspects or senses.

President Tyler of William and Mary prints in the quarterly *Historical Magazine* of the college a paper, some three years old, confirming Prof. Jameson's study of Virginia voting in the colonial period as communicated to these columns in 1893. He finds indications of a perhaps still larger (*i. e.*, more general) polling, and hence a stronger democratic contrast to New England's comparatively restricted vote in the period under consideration.

From another quarter in the South besides Virginia we are getting fragments of censuses showing the number of slaves. To the Pulaski (Tenn.) *Citizen* of July 22 Mr. Flournoy Rivers contributes a list of heads of families, with slave holdings, of Giles County, from the census of 1820. He follows the census-taker day by day for seventeen days, and tracks his course by the family names, as, "I think he must have been S. W. of Pulaski on this day's work," and, "He has turned and gone up Big Creek, I think," and, "He had come down Pigeon Roost Creek and was working up the old Columbia Road." The list will be continued. The largest number of slaves assigned to a single owner is thirty-one; Elizabeth Edwards held twenty-five. There is perhaps a majority of non-slaveholders, and two free blacks are recorded.

The future of Nigeria was the subject of an interesting address by Sir G. Taubman-Goldie, Governor of the Royal Niger Company, before the London Chamber of Commerce. The territory ruled by his company, he explained, was divided into two sections, differing as widely from each other in the character and civilization of the people as England from China. The southern third, lying to the south of the Benue and about the lower Niger, is thinly inhabited by pagans of the lowest type. The remaining two-thirds, which may be called Hausaland, is thronged with an enterprising commercial and industrial people. With good government, he believes that this country will, "at no distant date, become as valuable as any equal area of British India." A question of the first importance, but presenting great difficulties, is how it shall be administered. Until commerce is sufficiently developed to produce a revenue, local government is impossible. The best form would appear to be a permanent council in London, whose duty should be, not as now to conduct the affairs of a trading company, but simply to develop and administer the country.

A very interesting exhibition was recently held at Munich, consisting of manufactured articles and specimens of drawing, penmanship, and needlework produced by the inmates of the Royal Bavarian Institu-

tion for the Education of Crippled Children, a school which, though in existence for more than half a century, was until recently the only one of its kind in Germany. Within a year, however, a similar institution has been founded at Dresden, through the initiative of the Queen of Saxony, who had previously herself visited the school at Munich, and sent a teacher to study its arrangements and methods. The proficiency of the pupils at Munich, as shown by their work, was in many instances surprising. Samples of book-binding and various articles made of leather, such as pocket-books and valises, were of faultless workmanship. So were the sewing, knitting, art-embroidery, etc., done by one-armed girls. One of these unfortunates, who had partial control only of her badly crippled left hand, had learned to draw geometrical figures with great precision and an apparently firm stroke. The penmanship of several boys was absolutely perfect, and some of this year's graduates have been appointed court stenographers. The annual report of this admirable charity can be had of the inspector, I. Erhard, Klenzestrasse 54, Munich.

—Mrs. Bishop's account of her recent journey in western China, in the *Geographical Journal* for July, is a remarkable testimony to the capacities, resourcefulness, and enterprise of the Chinese who live beyond the influence of white civilization. They long ago grasped the idea that the prosperity of a country depends largely upon its roads, and a frequent method of displaying local patriotism is for a man to present a road to his district. Broad, flagged, shaded with superb avenues of trees, and thronged with burden-bearing coolies she found them, while here and there, especially in the rock galleries of the mountain passes, were tablets in honor of the donors. The correct principles of irrigation seem to have been discovered by these people, for the "boundless fertility and wealth" of the great plain of Cheng-tu and "its immunity for two thousand years from drought and floods" are the monument of the engineering genius of a man who lived B. C. 206. In some parts of the province coal is so abundant that "the children hack it daily" from the roadside for cooking purposes, while the traffic in it is enormous. "Every town and large village has its special industry—silk-weaving, straw-plaiting, hat-making, dressing hides, iron or brass-work, pottery and china, chair-making, dyeing, carving and gilding idols," paper-making, etc. The cultivation of the poppy, it may be said, is "annually trenching more and more on the rice lands." The scenery is surpassingly beautiful: heights crowned with castles; temples with porcelain fronts in rich coloring; bridges with roofs decorated in lacquer and gold; and "palatial" farmhouses in groves of cedars, bamboo, and fruit-trees, all amid "a paradise of greenery and fertility." In many of the towns the inhabitants are hostile to foreigners, and Mrs. Bishop was mobbed several times, once seriously injured, her most brutal assailants being men of the literary class. She crossed the border mountains into eastern Tibet to a region hitherto unvisited by a white traveller. The scenery was magnificent, and the inhabitants, the Mantzu, were interesting, the women being noteworthy for their great beauty and their equality with the men. In one instance her official escort consisted of "two handsome laughing girls, distaff in hand, fearless and full of fun." She succeeded in penetrating some distance into this country, when her further progress was stopped by a tribal war, and she returned to Cheng-tu by the same route, and reached Ichang in June, 1896, having travelled in four months and a half 1,200 miles by land and about 1,000 by water.

—The *Journal* also contains an account by Dr. Bell of the exploration of a recently discovered river flowing into the southernmost part of Hudson's Bay. Its basin, which is some 60,000 square miles in extent, has a soil suitable for agriculture, stock and dairy farming, is well wooded, and "promises to be rich in some kinds of economic minerals." The inhabitants consist of only some thirty or forty families of Crees. Among its fishes is a species of chub, which collects gravel and stones, "weighing from less than one ounce up to about one pound," and heaps them together in the bottom of the river, at a suitable spot for hatching its eggs—that is, in tolerably shallow water where there is a moderate current. A picture is given of one of these nests, which sometimes contain four or five tons of material. Col. G. E. Church contributes a careful and detailed account of Costa Rica, in which the most noteworthy fact is the slave-raids of certain rubber-collectors of Nicaragua, who plunder the settlements of the Guatusos, murder the adults, and capture the children, "whom they sell in San Carlos, Nicaragua, as 'servants,' at $40 to $50 per head." Each of these articles is accompanied by a map.

—The Royal Geographical Society of London, despite its recent ineffectual appeal to the Lords of the Admiralty for official assistance towards prosecuting the work of discovery in the south polar regions, has determined not to allow the matter which it has so warmly espoused to drop. The prospective starting of the Belgian expedition under command of Lieut. Gerlache, and the possible robbing of the honors that had been won for the British flag by Sir James Clark Ross somewhat more than half a century ago, were, in a measure, doubtless the incentive to the special appeals of the Geographical Society; but it is the happy fortune of that influential body to have in its chief, Sir Clements Markham, not only an enthusiast for polar exploration, but one of the ablest students of it, and one who has had some practical experience in arctic work himself. At a special conference recently held by the Society, which was attended by some of its most noted members, as, Sir Joseph Hooker, Admiral Sir George Nares, Admiral Sir Erasmus Ommanney, Admiral Wharton, and Sir John Kirk, and was designed to induce the Australasian premiers to bring the matter before their respective governments for coöperation in a general British expedition, a first practical step towards the formation of such an expedition was taken in the announcement that the Royal Geographical Society was prepared to contribute towards it any sum up to £5,000 to the amount which the colonial governments might subscribe. By those who have made a careful study of the needs of an antarctic expedition, it is believed that £10,000 to £12,000 would adequately equip one of moderate dimensions, which yet, under judicious leadership, would probably accomplish as much as the elaborate expeditions ordinarily organized under Government control. Doubtless, Victoria Land, almost due south of Australia, would be the objective point of British attack, and here a year's work could readily be accomplished for the sum mentioned.

—Among the sources, not yet explored, of the history of English colonization in America must be included the records of the High Court of Admiralty which are preserved in the Public Record Office, London. Work among these old documents is of a rather laborious nature. Students will, therefore, recognize the value of the volume recently published for the Selden Society, by Mr. Bernard Quaritch, of 'Select Pleas in the Court of Admiralty,' edited for the Society by Mr. Reginald G. Marsden. The new volume is the second publication of the kind, and covers the period from 1547 to 1602. The value of such documents may not be readily seen by the general reader, but, none the less, that value is very real. At the present time there is a lawsuit as regards the rights of the city of Colchester over fishing for oysters, which will be decided one way or the other according to the jurisdiction shown by some of these old Admiralty papers to have been exercised in years long past. To the student of American history, however, the most interesting portion of Mr. Marsden's volume is that section of his Introduction which treats of documents relating to transactions in the New World. Of records later than the reign of Queen Elizabeth, the following are noted by Mr. Marsden:

Voyage to Virginia (1633); Records of Admiralty Court of Jamaica (1662); Newfoundland Fishery; Voyage of the *Neptune* to Virginia, with Lord de la Warre as Captain-General; Non-delivery of passengers in Virginia; Negro "passengers"; Lord Baltimore *contra* Orchard: Desertion on Voyage to Maryland; Chesapeake Bay: Damages for not carrying provisions to Colonists; Export of Horses to Barbados; Lord Baltimore *c.* Kirke; Claim for destruction of boats and fish stages in Newfoundland—Ordinance of the King; The Dutch in Pernambuco; Cromwell's expedition to San Domingo and Jamaica; Hudson's Bay Company, Interloping, Validity of Charter: Carrying persons from Barbados without license; Captain Kidd, the Pirate; Sir Henry Morgan, Buccaneer and Governor of Jamaica; Lord Willoughby's agreement with Sir George Aisare as to the rendition of Barbados.

—Despite the numerous assurances that have been given regarding the entire trustworthiness of the method employed in what is known as the Dansan-Chassagne process for color-photography, it would now seem that the "selective" art that was claimed for it is not purely automatic. In other words, the coloring matters which are taken up by the photographic print do not fully attach themselves naturally to such parts of the print as would be of a like color had the image been produced in natural colors, but require for their adjustment—or, more properly, application—the hand of an operator especially discriminative in the selection of colors, as we are told that the results depend largely "on his judgment and skill in applying the colors in the right places." Mr. Henry Trueman Wood, who, in an announcement published in the early part of February last, is mainly responsible for throwing the photographic world into a flurry of expectation, and whose statements received the almost unreserved support of the distinguished President of the London Institute of Chemistry and of the

British Photographic Society, Sir Frederick Abel, makes this admission in *Nature* of July 8. From his statements we learn that a result can be obtained by anybody after a little instruction, but only after working up the different parts of the picture through local hand applications of the different coloring liquids. That a certain natural selective power is exercised by the different tints is still maintained, but, as is rather pointedly remarked, the difficulty is "to satisfy one's self as to how far the process is purely mechanical and how far it is a matter of skill." Scientists will agree with Mr. Wood that, whatever may be the ultimate practical value of the process, it will still prove of theoretical interest if, as an outcome of it, it should be proved that a monochrome photograph has even the smallest power of color-selection, dependent upon the tints of the original.

—Dr. Fairclough's Johns Hopkins dissertation on 'The Attitude of the Greek Tragedians toward Nature' is a conscientious collection of the chief passages of Aeschylus, Sophocles, and Euripides, that bear on his theme. His results are, in the nature of the case, mostly commonplaces. "Every schoolboy knows" that the Greek tragedians let slip opportunities for purple patches of description which a modern would hardly neglect; that nature is for them mainly a stage for human action and passion; that they most frequently take their imagery from the sea and nautical pursuits; and that the utilitarian view of nature prevails over the sentimental in ancient poetry. More interesting are the statement that Aeschylus mentions no specific flower, the observation that the later plays of Sophocles reveal more feeling for nature than the earlier, and the ample illustration given of the sentimental modernity of Euripides as exhibited in the variety and picturesqueness of his flowers, fruits, and trees, his richer color vocabulary, his appreciation of aerial effects, his use of symbolism, and the "pathetic fallacy." The suggestion that Aristophanes was consciously parodying these Euripidean qualities in the "Frogs" arouses the attention, but is not borne out by the natural interpretation of the passages cited. The image in "Prometheus" 885 is probably not that of a muddy river rushing down to meet the clear seawater, but merely of the silt stirred up from the bottom. The "boy that pursues a flying bird" is proverbial. The metaphor of dewdrops for lion-whelps may reveal an Oriental fancy, but it belongs to the language rather than to the poet. It is found, by the way, in Wordsworth. Λεπτοψάμαθος ("Suppl." 4) is hardly an epithet of "material wealth." The meteorological πολυπραγμοσύνη noticed by the scholiast on the "Rhesus" is an altogether different thing from the modern feeling for nature, and in any case cannot make Euripidean authorship probable. It is an indisputable truth that "there is an utter absence of the sense of moral responsibility" in *Clytemnestra* when she likens herself, splashed with her husband's blood, to the corn-land shivering for delight "when the dew glistens on the pearled ears" in the birth-pang of the bud. But, as Pindar somewhere says, it is not best that every truth should show its face everywhere.

—Students of the law of evidence will be interested to know that a new edition of the 'Indian Evidence Act' (London and New York: Henry Frowde) has been issued, with brief notes, by Sir William Markby, formerly an Indian judge and now Reader in Indian Law at Oxford. Sir William is a well-known legal author. The Indian Evidence Act, as is known, was prepared by Fitzjames Stephen between twenty and thirty years ago. It was a crude production, but none the less it was quickly fastened upon India, and, with various amendments, is still the law there. The administration of it has caused much trouble. It is very instructive to read now the brief comments of the careful and exact thinker whose duty it is to expound this statute at Oxford. Many of his criticisms—"It was impossible," he says, "for me to conceal that I disagree entirely with some of Sir James Stephen's views on this subject"—are applicable to Stephen's well-known 'Digest of the Law of Evidence,' and they should be read by all who use that work. The Indian Evidence Act is, indeed, a sort of first draft of what afterwards became the Digest. Markby's searching comments on the topics of relevancy, the hearsay rule, character and opinion evidence, as well as other subjects will be found very useful. Stephen was far too rash and ill-instructed on this subject to have been allowed so free a hand. We should add that the author's notes are brief, and are intended "to assist students in preparing for their examinations."

PASTOR'S POPES OF THE RENAISSANCE.

Geschichte der Päpste im Zeitalter der Renaissance, von der Wahl Innocenz' VIII. bis zum Tode Julius' II. Von Ludwig Pastor. Freiburg i. B. 1895.

It is long since a more important contribution than Dr. Pastor's 'History of the Popes of the Renaissance' has been made to our knowledge of the pre-Reformation period. The present volume is the third, and it is to be hoped that the fourth, comprising the pontificate of Leo X., will not be long delayed by the author's diversion to the editorship of Janssen's 'Geschichte des deutschen Volkes.' For many years so much earnest research has been directed to the archives of the fifteenth and sixteenth centuries that it would seem as though little could be left to glean, but Dr. Pastor's untiring diligence in all accessible depositories of documents has resulted in revealing many new and interesting details. Moreover, he has familiarized himself with the labors of all other scholars in the innumerable monographs which have done so much to elucidate doubtful questions and conflicting currents of thought, and to explain the tangled diplomacy and swift alternations of policy of that eventful time out of which the modern civilized world has developed. Nothing seems to have escaped his all-devouring industry, which is amply attested by the crowded references and piled-up authorities cited in the abundant footnotes—though this insatiable appetite for citation, indeed, does not always discriminate as to the character of authorities. It looks odd, to say the least, to see (p. 227) Florian's 'Gonzalve de Cordoue,' in a Spanish translation, gravely alleged as a source for the capture of Granada by Ferdinand and Isabella.

The importance of Dr. Pastor's work is not only thus intrinsic, but it is also extrinsic as a semi-official exposition of the Catholic view of the events which led up to the Reformation in the deep degradation of the Holy See of the Renaissance. The secret archives of the Vatican were thrown open to the author, even to the consistorial records and the Regesta of Alexander VI., which he tells us have been sealed books for three hundred years. His labors have been welcomed with acclamation by the faithful; they have won the special thanks of Leo XIII., and translations have already appeared in English, French, and Italian, while others are preparing in Spanish and Czech. It is evident that the book is to be regarded as the authoritative defence of the Church against the assaults of Protestant scholarship.

The position assumed by Dr. Pastor therefore becomes of interest to all students, irrespective of the facts which he has so laboriously accumulated. There is, on his part, evidently an earnest desire to be fair and impartial, and he unquestionably believes himself to be so. Nevertheless, the personal equation of the author renders his book not a little *tendenziös*. He is necessarily an Ultramontane, believing in the highest claims advanced by the Holy See as to the autocratic constitution of the Church, with the Pope as the irresponsible sovereign over all the faithful in the *temporalia ad spiritualia ordinata*, and it is impossible for him to write in a purely objective spirit. His faith is too robust to be shaken even by the intrigues and shameless bribery of the conclaves, so candidly described in his pages, through which successive popes gained the tiara. The motto from Leo I. prefixed to this volume—"The dignity of Peter is not lacking even in an unworthy heir"—indicates the task which he has set himself to execute, viz., to reconcile the vicariate of Christ with the wickedness which he has to relate of the vicars. Sixtus IV. he exculpates by attributing the foulness of his reign to the kindred with whom his nepotism afflicted Italy. The miserable Innocent VII., we are told, was the soul of goodness and kindness; it was his virtues rather than his faults which plunged the papacy into deeper degradation. Alexander VI., he admits, was depraved, but the atrocities which he committed and encouraged had at least a noble basis, the love of his kindred and especially of his children (p. 288)—a curious excuse for a pope bred to the Church and vowed to celibacy. Besides, he at least maintained the purity of the faith, and the value of a jewel like the papacy is not diminished by an unworthy setting (p. 475). Julius II. is Pastor's hero; there is no reproof of his faithlessness, of his tortuous policy, of his military enterprises; he is lauded without stint as the man who recovered and enlarged the papal territories and drove the French out of Italy, with scanty reference to the fact that he thereby firmly established Spain in Naples, thus rendering the peninsula the battle-ground between those two Powers, with the eventual result of Spanish domination. It is a slight but significant illustration of Dr. Pastor's apologetic attitude that when he has occasion (p. 557) to mention the betrothal of Julius's natural daughter Felice to Marcantonio Colonna, solemnized in Rome during her father's pontificate, he is careful to speak of her, not as the child of Julius, but of Cardinal Giuliano della Rovere—his ante-papal title.

The same probably unconscious tendency pervades the work, and renders it not wholly

worthy of implicit confidence, in spite of the author's boundless learning and evident striving for minute accuracy of statement. It affects not only his judgment, but also his selection and presentation of facts. Thus, in his effort to prove that, in spite of the mocking spirit and heathenish tendency of the Renaissance, the popular masses were still deeply pious and moral, he devotes considerable space (pp. 26-34) to the Confraternities as evidence of the religious activity of the time, and from his description no one would imagine that they were aught but zealous associations for pious works, although the virtually unanimous testimony of the period is that their chief attraction was the riotous feasting and debauchery at their banquets; and Erasmus urged their suppression on the ground that they were nothing but conventicles of Comus and Bacchus. Dr. Pastor's treatment of usury is equally one-sided (pp. 79-82). He dwells on the exorbitant rates of usance customary at the time, but does not point out that this in great part arose from the prohibition and outlawry by the Church of any profit whatever for the loan of money or property, thus necessarily raising the interest charges of those who risked the punishment provided for the usurer; and, moreover, that, while forbidding the taking of interest by the laity, the Church permitted the ecclesiastical foundations thus to derive income from their surplus capital. Again, the neo-paganism of the Renaissance doubtless had much to answer for, but it was not responsible, as Dr. Pastor assumes (p. 97), for a revival of unnatural crime, the continued prevalence of which throughout the Middle Ages is sufficiently attested by St. Peter Damiani, Alain de Lille, Fra Giordano da Rivalto, and other moralists. Equally untenable is the assumption (p. 108) that the absurd confidence reposed in astrology during the fifteenth century is attributable to the Renaissance; for the so-called science had survived the ruin of the Roman civilization, and had been eagerly cultivated ever since the Barbarians had learned enough to comprehend its seductive promises. The papal legate who, in 1256, conducted the crusade against Ezzelino da Romano, was accompanied by a Dominican astrologer, and Ezzelino himself was surrounded by a corps of similar advisers.

Twice Dr. Pastor tells us (pp. 250, 486) that most of the popes of the fifteenth century showed great toleration for the Jews. It is the fashion nowadays to repudiate for the Church all responsibility for the hideous persecutions of the Middle Ages, and the impression which he thus seeks to convey is a *suggestio falsi*, for he omits all reference to the terrible bulls of Eugenius IV. in 1442 and of Nicholas V. in 1447, of which the object seems to have been to force the unhappy Hebrews to conversion by driving them to despair. There is a similar attempt (p. 251) to relieve the Church of the stigma of fostering the fearful witchcraft craze by arguing that the celebrated bull *Summis desiderantes* of Innocent VIII., in 1484, contained no doctrinal affirmation of the reality of witchcraft, and yet, as Innocent confirmed its punishment by the stake and forbade interference with his inquisitors by those who were incredulous, if he did not affirm its reality his action was mere wanton and purposeless cruelty. Dr. Pastor, moreover, is careful to confine himself to this bull, to which an undue importance has been attached, for it was only one of a long series through which the belief in witchcraft was sedulously strengthened by successive popes. Thus, he makes no allusion to similar utterances by Eugenius IV. in 1437 and 1445, by Nicholas V. in 1451, by Calixtus III. in 1457, by Pius II. in 1459, by Alexander VI. in 1494, and by Julius II. some ten years later. We shall be curious to see in the next volume how Dr. Pastor will handle the quarrel between Leo X. and the republic of Venice when the latter defended the so-called witches of Valcamonica against the papal inquisitors.

The same tendency pervades our author's vigorous characterization of Machiavelli, in whom he recognizes the incarnation of the pagan Renaissance. He is reproached (p. 121) with regarding religion as merely a useful tool of statecraft, but Dr. Pastor does not stop to ask himself how Machiavelli could well consider it otherwise when he had never seen a vicar of Christ who had not so utilized it for the aggrandizement of his see or of his kindred. The statecraft of the period was indescribably base and wicked, but it is instructive to compare the author's indignation at Machiavelli's academic acceptance of it with his tolerance of its practical application by the Holy See. Thus when, in 1484, Innocent VIII., to avert the threats of Ferdinand of Naples, executed bulls conveying to him the territories of Benevento, Terracina, and Ponte Corvo, they were not delivered, but were deposited in escrow with Cardinal Giuliano della Rovere, and Innocent caused a notarial act to be taken reciting that the bulls were only for appearance, to avoid the violence of the king, and that he had no intention to surrender the cities, but would resist by force any attempt to seize them. The only comment which Dr. Pastor makes on this elaborate fraud (p. 181) is that it was a strange method of escaping the difficulty. So, when Julius II. secured his election (p. 521) by entering into an agreement with Cæsar Borgia to appoint him standard-bearer of the Church and to support him in his possessions, and subsequently, when occasion offered, redeemed his pledges by arresting Cæsar and delivering him to the dungeons of Ferdinand of Aragon, there is no word of censure for this breach of faith. In fact, the placid way in which the historian describes the crimes, the voluptuousness, and the corruption of the papal court might be taken as a model of philosophical indifference, akin to that of Machiavelli, were it not in strong contrast to the warmth displayed when he treats of the determination of Louis XI. and his successors to maintain the liberties of the Gallican Church, and the efforts of unfortunate Germany to acquire the same measure of independence.

If space permitted, many other topics would invite and repay criticism, but enough has been said to enable the reader to appreciate the character of the work. It is of first-rate importance; it throws fresh light on many obscure points and debatable questions, and no one can hereafter venture to treat of the period without consulting it. The author has amply demonstrated his abundant learning and untiring industry, but he is deficient in the judicial quality which alone could render him an authority to be accepted without reserve.

ANCIENT EGYPTIAN RELIGION.

Religion of the Ancient Egyptians. By Alfred Wiedemann, Ph.D., Professor in the University of Bonn. London: H. Grevel & Co.; New York: Putnams. 1897. 8vo, pp. xvi, 324.

Judging by the recent past, we are destined soon to have a very respectable Egyptological literature in English, even if a considerable portion of it comes to us by way of translations from the French and German. The 'History' by Prof. Flinders Petrie has progressed as far as the second volume and the eighteenth dynasty. Miss Amelia B. Edwards's books are of the genial sort which rivet the attention even though their scientific value is not of the very highest. Maspero's 'Egyptian Archæology,' 'Life in Ancient Egypt,' and 'Dawn of Civilization' are valuable in every way, being the work of a first-hand and first-class scholar and explorer. Erman's 'Life in Ancient Egypt' is a work somewhat similar to the volumes of Wilkinson ('The Ancient Egyptians'), but surpasses them in consequence of the author's thorough acquaintance with the contents of the texts which he interprets, as well as by reason of the many discoveries made since the days of the pioneer. Brugsch's 'History' is also to be mentioned, though, even in the one-volume abridgment of Miss Brodrick, it contains much that is conjectural and probably untrue. The many memoirs of the Egyptian Exploration Fund, the special volumes of Prof. Petrie, too numerous to be mentioned here, Sayce's repetitious works, and Mariette's 'Outlines' may also be added to the list. Budge's 'Mummy' is among the more recent volumes to appear, and it is one of the most useful and valuable of all in the vast amount of archæological lore which it contains. The translation of the 'Book of the Dead,' by Le Page Renouf, now appearing, and the version of Budge are the best that exist anywhere, greatly superior to the volume of Davis, which contains an unimproved and (as to the notes) somewhat curtailed rendering of the version of Pierret. A previous volume of Wiedemann, on 'The Ancient Egyptian Doctrine of Immortality,' was translated and published a short time since, and now we have the present work as a very valuable contribution to the subject so far as English readers are concerned. It has been known to scholars since 1890 in the original, and has been valued for its conspicuous merit. Other English books, of recent date, but of less striking worth and originality, might be enumerated, but the above suffice to justify the assertion with which we set out, and which takes no account of the older works of Wilkinson, Birch, and others, which retain a certain amount of value even if it be largely historical, marking the steps of the progress that has been made since the opening of the century.

No mention has been made of Renouf's Hibbert lectures on the Egyptian religion, because that work, while valuable in many ways, is vitiated by the preconceptions of the author and by the fact that he holds a brief for a particular theory. In fact, this is the difficulty with all books on the subject, the one now under consideration being, probably, the most free from this rather damaging imputation. Wiedemann agrees with Maspero in many fundamental positions and in general explanation of the

growth and development of the Egyptian pantheon; Renouf follows the lead of Max Müller; and De Rougé, with his followers, Pierret, Brugsch, and others, see traces of an original monotheism in the religion of the Egyptians. The naturalistic theory of Wiedemann and Maspero agrees more nearly with the views of such scholars as Erman and Eduard Meyer, and seems to be the one likely to prevail in the long run. It may therefore be regarded as a fortunate occurrence that the treatise now made accessible to English readers is the work of Wiedemann, rather than the somewhat fantastic and largely fanciful work of Brugsch.

A national religion is a very large matter, especially when the period of its existence is to be measured by thousands of years instead of by centuries. It is impossible to conceive of a system of belief that should remain unchanged during so long a time, as asserted by Renouf, but there is a sense in which the statement is true. Wiedemann characterizes the Egyptians as "conservative," and so they were if it be meant that they preserved that which was old; but it is not true if it be understood in the sense that they were not open to change, innovation, and addition by accretion. The old and the new existed side by side, neither displacing the other, with never a consciousness of inconsistency or incongruity. Deities were merged into one another, qualities of one were attributed to another, till the pantheon resembled the shifting pictures and combinations of the kaleidoscope. The religion thus had a history, but the nation never had a religion in the sense of a dogmatic system, congruous and articulated in its parts and divisions. The ultimate nucleus, so far as it is possible to trace it or to discover its origin, was in the god of the nomos or city, together with his family or adherents. Each of the forty-odd nomes (the number varied in different periods) of both Upper and Lower Egypt had its tutelary deity, who was usually the leading god of the capital of the nome. The cities had their special god or circle of gods, and these grew powerful or weak according as the prestige of the city waxed or waned. A notable instance of this is seen in the preeminence of Ptah, the god of Memphis, in the period when Memphis was the seat of the ruling Pharaoh. The condition was changed at the time of the invasion of the Hyksos, and Ptah was relegated to an inferior position, or to the rank of a local deity. The revolt which finally ended in the overthrow of the Hyksos had its origin at Thebes, whose god was Amon. When the rule of the native princes was restored, it was that of the Theban house, and the god Amon, particularly as Amon-Ra, attained to a fulness of religious recognition which corresponded to the Theban political hegemony. The single attempt at the establishment of a monotheistic faith, the solar worship of Aten (Semitic, Adoni or Adonis), was an importation from the East, or at least was instituted under Oriental or Semitic influence. Its principal conflict was with the Amon worship, and it developed an *odium theologicum* which found vent in hammering out the name of Amon from the monuments even where it occurred as a component part of the name of a royal predecessor of the "heretic" king. The latter himself changed his name from Amenhotep (Amenophis IV.) to Khunaten, in order to remove all reminiscence of the hated god. But the domination of Amon was too powerful, his priesthood too strongly entrenched, their interest in the return to recognition of Amon too intense, to allow the revulsion to be long delayed after the passing of the innovating king.

The monotheistic theory of the religion of the Egyptians finds its support in numerous phrases which, taken alone, suggest nothing more evidently than a monotheistic conception. The word "god" occurs unqualified as subject in many sentences. Such expressions have been used by theorists, after the antiquated proof-text method, to support a hypothesis which cannot stand the test of the context. In spite of surface appearances, these passages in no case refer to deity in general, but invariably to the local divinity whose rule was acknowledged in the city or region in question. The problem of the original religion, however, is a far different one, and in this matter the author observes a cautious discretion which refuses to permit him to make any positive statements or even to hazard a hypothesis. The fact is, that, at the time of the earliest monuments, we are met by a well-developed pantheon, whose origin and genesis are veiled in the obscurity which preceded the dawn of human history. To be sure, the Egyptian myths peopled that period with gods, but they, of course, do not afford us any basis on which to build. It is also rather doubtful whether further excavation will furnish material by which to solve these questions.

To all outward appearance there is no lack of material from which to gather the elements to be woven into an account of the religion of Egypt. But closer examination shows that the texts on temple walls, stelæ, obelisks, and other objects contain a mass of bombastic phrases and repetitions which defy all reason. They are to some extent descriptive of the gods, but their phrases are hard to read and harder to comprehend. They often contain references by implication to myths which were so well known or so closely guarded that they were, apparently, never written out. Consequently the major part, in reality nearly everything, of the Egyptian mythology has perished. There are some survivals, for instance, the Osiris and Isis myth (preserved principally by Plutarch), and the tradition of the destruction of disobedient and rebellious mankind; but the very richness of these stories makes the extent of the loss only the more apparent. All that is left in most cases is an occasional phrase which hints at much behind.

The 'Book of the Dead' is the great storehouse of Egyptian theology, but it never attained to the dignity of a canon in the Egyptian period proper, and at no time did it come to a degree of definiteness of content which prescribed its exact and unalterable limits. It was a growth, and chapter was added to chapter till they approached two hundred in the aggregate, but we have no evidence that any single papyrus ever contained an absolutely complete compilation of them all. This part of the material has not been utilized with the fulness that it deserves, and the main criticism which one is tempted to make on the present work concerns this topic. There are others which one would like to find treated, but which were excluded, probably because, while they relate to religious observances, they fall in the archæological division of the subject rather than within the proper scope of this work. Furthermore, the author's previous work on 'Immortality' covers much of this ground.

The general scope of the book may be briefly stated. The most prominent but not the sole characteristic of the religious beliefs in the valley of the Nile was in the preëminence of the solar element. Many of the deities in human form typified phases of the energy of the solar radiance or the different positions of the sun himself at morning, noon, or night. The treatment of "Sun Worship" therefore takes first place and is followed by an account of what is known with regard to the "Solar Myths," and "The Passage of the Sun through the Underworld." The author then proceeds to describe the various "Chief Deities," their attributes, their involved and promiscuous family and marital relations, and the forms under which they were conceived and adored. A chapter of considerable interest is devoted to "Foreign Gods" and another to the "Worship of Animals." Two more are given to "Osiris and his Circle" and to the "Osirian Doctrine of Immortality," indispensable to an understanding of the funerary practices of the people. Incidentally much light is thrown upon the moral standards of this people by the wonderful "Negative Confession" of the 125th chapter of the 'Book of the Dead.' "Magic and Sorcery" receive also their due consideration, and the final chapter on "Amulets" is one which will enable the visitor to the Egyptian collection of a museum to appreciate and understand the small objects which are ordinarily exhibited there in such profusion.

In its English form this work is practically a second edition of the original, rewritten and enlarged. The translation is anonymous, but it is in gratifying contrast with many of the mechanical, penny-a-line renderings of German historical and theological works which are foisted upon a long-suffering public. In some ways, also, the English is a great improvement upon the German publication. The foot-notes are more numerous and valuable; seventy-odd illustrations, some of them folding-plates, serve to set off the subject admirably, while the extensive index even doubles the value of the work for purposes of consultation and reference—a fact which the present writer appreciates to the full, as he was compelled to make his own index to the original. The book reads well, and it is now no longer true that we have no good book in the language dealing with the religion of Egypt.

The Fall of the Congo Arabs. By Sidney Langford Hinde. T. Whittaker. 1897. Portraits, plans, and map. 8vo, pp. viii, 308.

This work possesses a two-fold interest. It is the narrative, by an eye-witness, of scenes in the Central African phase of the struggle of Mohammedanism with Christianity, which is still in progress in south-eastern Europe and in the eastern and western Sudan, and which is imminent in North Africa and Asia. It also gives important testimony in regard to a charge recently made against the Congo Free State. The Berlin Conference, twelve years ago, gave a commercial company sovereign power over a vast region, not simply to develop its material resources, but to put down slavery and the slave-trade, to civilize and educate the

natives. For a time nothing was heard but commendation for the zeal and succcess with which the State was opening the great river and its tributaries to commerce, by building a railway, establishing lines of steamboats, founding trading-stations, and sending out exploring expeditions. But of late this chorus of praise has ceased. In its place, first faint, then distinct, charges have been made that the State, so far from being a civilizing agent, has been instrumental in introducing a barbarism and slavery worse than that which it found upon the Congo. It has been accused of employing cannibals for soldiers and of practising inhuman methods for the collection of the rubber-tribute and the punishment of the wretched people who failed to pay it. The chief witness in support of the former charge is the author of this book, and his proofs can be found in repulsive fulness in his narrative.

On entering the service of the Free State, Capt. Hinde was sent into the interior to join an expedition to explore Katanga, and reached Lusambo in May, 1892, on the day on which Commandant Dhanis returned to it from a successful campaign against one of Tippu Tib's slave-raiding agents. The route of the expedition lay through a devastated region, in which "every height was covered with splendid palm plantations and the remains of villages," to N'Gandu, the residence of this chief. The town, containing from ten to fifteen thousand inhabitants, was surrounded by a palisade, nearly every tree of which was crowned with a human skull. The entrances to the several gateways were "ornamented by a pavement of human skulls, . . . of snowy whiteness, and polished to the smoothness of ivory by the daily passage of hundreds of naked feet. I counted more than two thousand skulls in the pavement of one of the gates alone." A short distance from this place, Capt. Hinde and his companions were stopped by the tidings that the son of Tippu Tib, at the head of a large force, was marching to attack them. The Arabs, jealous of the advance of the Europeans into territory which they had ruled for forty years, and angry at the consequent interference with the slave-trade, had now determined to drive them out of Central Africa. The intended destruction of the Katanga expedition was a part of extensive operations in the course of which several stations were captured, Emin Pasha murdered, and his followers enslaved. These were their only significant successes, for Commandant Dhanis, in a vigorous campaign which lasted more than a year, completely defeated them and destroyed their two great towns, Nyangwe and Kasongo.

Capt. Hinde sketches briefly the history of the war, which covered a wide extent of country, dwelling naturally more at length upon the incidents of which he was an eyewitness. Especially interesting are his descriptions of the centres of Arab civilization, towns of from thirty to sixty thousand inhabitants, but now entirely deserted. The forest had been cut down for miles around them, and in the clearings were maize and rice fields, sugar plantations, and fruit gardens. In the houses at Kasongo, "silver and glass goblets and decanters were in profusion," while "even the common soldiers slept on silk and satin mattresses, in carved beds with silk mosquito curtains." Here also were found the diary and two decorations of Emin Pasha, who, "our Arab prisoners told us, . . . was the most inoffensive man that was ever seen in Africa. They had, according to their own accounts, no other reason for murdering him except that a general massacre of white men had been decided on, and, coming into a district in which all the white men had already been killed, he shared their fate." After the taking of the last Arab stronghold, Capt. Hinde explored the Congo as far as the mouth of the Lukuga, a stream connecting the river with Lake Tanganyika. An attempt to reach the lake failed through his illness, and he was obliged to return to England.

The war with the Arabs was of no slight importance, considering the numbers engaged and the issues at stake. At the beginning, Commandant Dhanis had under his command "about 25,000 natives, 400 regulars, and six white officers." The number of their opponents is of course purely conjectural, but it was immensely greater, as their losses are "estimated at seventy thousand men." The result was the overthrow of what bid fair to be another great Mohammedan empire. "A great element in our success," Capt. Hinde says with a frankness almost brutal, was "the fact that both sides were cannibals, or rather that both sides had cannibals in their train." The Mohammedans, dreading the mutilation of their bodies, and their consequent exclusion from the highest heaven, would on a reverse "fly from the field with all possible speed—not so much in order to save their lives as through fear lest their carcasses, in the event of their falling, should be torn to pieces." This seems to have been invariably the fate of the wounded and killed. After a fight at Nyangwe, when "over one thousand men fell," the burial force found only a few hundred heads, "all the bodies having been carried off for food." The practice is not confined to one region or race, but is prevalent throughout the whole Congo Basin. There were instances of it even among the men employed on the steamboats at Stanley Pool. According to Capt. Hinde, it is on the increase. He mentions one tribe, the Balubas, "a fine, healthy, industrious race," "agriculturists, iron-workers, and cloth-makers," who until quite lately "were not cannibals, and even now the *men* only eat their enemies who fall in battle." This growing appetite for human flesh he attributes to the greater intercourse among the natives since the coming of the Europeans has made travelling easier and safer. "Formerly the people who wandered from their own neighborhood among the surrounding tribes were killed and eaten, and so did not return among their own people to enlighten them by showing that human flesh was useful as an article of food." If these statements are true (and they are supported by numerous facts taken from the author's personal experience), the increase of cannibalism is perhaps only a temporary phase of the inevitable deteriorating effect of the contact of the whites with the negroes. Apparently it would seem to be impossible for the Free State to administer its territory without occasionally employing cannibals. The crime, when detected in one of its servants, it should be said, is punished with death.

The interest of the book is well sustained throughout. The author's descriptive power is shown, not only in the incidents related, but in his admirable account of the ten-inch path which traverses Central Africa in every direction, and of the forest with its absence of life and color, except sombre greens and browns. He is not a scientific observer, however, and he adds little to our knowledge of the people among whom he lived for three years. Nor is he sufficiently careful in some of his statements. An account of the Batwa, a pygmy race inhabiting the forest bordering on the Lomami River, is occupied mainly with their skill in the "shooting of three, or even four, arrows so rapidly that the last is discharged before the first reaches its mark," and with the deadliness of their poison. "An elephant in one of our stations, which was scratched on the haunch by a poisoned spear, fell down dead before going a hundred yards." Of their appearance, their manner of life, their habitations, their language Capt. Hinde says nothing, and yet if "their average height is under four feet," as he states, they are the most remarkable race in the world in this respect and well deserve the closest observation. If we are not mistaken, the smallest people known to science are the Akkas, who range in height from 4.3 to 4.7 feet. A striking portrait of Baron Dhanis, as well as one of the author, together with some diagrams and a map of the southeastern Congo Basin showing recent explorations, add to the attractiveness and value of the volume.

Julian M. Sturtevant: An Autobiography. Edited by J. M. Sturtevant, Jr. Fleming H. Revell Co. 1897.

The personal interest attaching to this autobiography is not slight, for we are put in touch with a man of sterling character and many winning traits, whose experience was one of much more than ordinary hardship and variety. What is incidental, however, is the most valuable and attractive element—the rough and hard beginnings of a new civilization in the West from sixty to seventy years ago, and especially the humors and the sinuosities of ecclesiastical politics as they were exhibited on a narrow stage, which, nevertheless, was typical of a pretty general condition. Mr. Sturtevant writes the story of his life with great frankness and simplicity, and with that evident enjoyment which goes far to insure the reader's sympathy. Now and then his grammar halts as we should not expect a college president's to do if we were applying the severest modern standards to the pioneers of college education on the verge of civilized society.

Dr. Sturtevant was Connecticut born, in Warren, Litchfield County, in 1805. All his early associations were those of New England Puritanism, and he was always true to them, his portrait confirming the text in this particular. At the same time, he was a growing man, and he sincerely deprecates the narrowness and bitterness of sectarian zeal, and the signing of creeds which can be neither understood nor intelligently assented to by young or old. He writes intelligently of the industrial conditions which encouraged emigration from New England to the West, the more so because political economy was for a long time one of his courses of instruction in Illinois College. His parents joined the emigrants in 1816. The account of the journey to Ohio, mostly on foot, is so fascinating as to make us wish we had been there, for all the rigors it entailed. The first stop, in Richfield, proved unsatisfactory. There was neither church nor school, and the homesick family "wept when they

remembered Zion." Very pathetic were the yearnings for the usual "means of grace." These yearnings took the Sturtevant family to Tallmadge, where education and religion had some germinal activity. There is a capital story of how the parents going for the belated cows were lost in the great forest in a terrific storm.

We soon find ourselves touching on the lives of men well known to history and fame. Elizur Wright was the principal of the local academy, and his son, of the same name, the better known abolitionist, translator of Lafontaine, and Massachusetts Commisioner of Insurance, was caught up into the vortex of a religious revival. Afterward he departed widely from the traditional faith, but Dr. Sturtevant has only kindly recollections of his early friend. Hudson was near by, and there lived Owen Brown, the father of "Old John." Owen was one of the worst of stammerers, and young Sturtevant in visiting him anticipated the morning prayers with natural anxiety. Strange to relate, in his Scripture reading Brown stammered little, and in his prayer not at all. When the boy was about leaving for Yale College, his father's voice choked with emotion and he could not go on with his own Bible reading. Then, fortunately, Owen Brown appeared, took the Bible, and brought the painful business to a solemn and impressive end.

From Yale we follow the autobiographer to New Canaan, where he taught school and fell in love with the lady whom he married, when, after a course of theological study, he set out in 1829 to found Illinois College, the plan for which had originated in a company of Yale theological students. The story of the journey and the small and rude beginnings of the enterprise is full of interest, one of many such stories concerning the initial stages of our schools and colleges. But at Jacksonville there were peculiar difficulties. Dr. Edward Beecher was made President of the college in 1830, and assumed the office in 1832. He and Mr. Sturtevant were Congregationalists in a Presbyterian community, and the college was under Presbyterian control. The arrangement was part of that doubtful development of ecclesiastical politics, the Plan of Union between the Congregationalists and Presbyterians, whereby the Congregationalists were to have New England to themselves and the Presbyterians all the rest of the country. Here was sufficient opportunity for jealousy and bickering, but it was indefinitely increased when the differences between Old and New School Presbyterians reached their climax in the formation of two separate bodies. Dr. Beecher and Mr. Sturtevant fell under suspicion and were tried for heresy, but acquitted by the local presbytery. Mr. Sturtevant's position was particularly trying, because the more he saw of the Presbyterians and their bickerings, the more stanch became his Congregationalist convictions of church polity. The situation was aggravated by the establishment of a Congregational church in Jacksonville with which he could not but sympathize, though he deprecated the movement. He writes with much feeling of the injury done to educational enterprises by sectarian jealousy.

The glimpses he affords us of the Beechers who flocked to Jacksonville are entertaining. He blames Catherine severely because her argumentative intensity made him forget the deference due to her sex. Dr. Beecher resigned in 1844, and Mr. Sturtevant succeeded him. There were times during the next dozen years when the fortunes of the college were extremely critical, but at length his persistent efforts gave it financial security, and, for its ecclesiastical basis, a compromise between Congregationalists and New School Presbyterians, which, however ludicrous in its appearance, has promise of success. The President is to be elected first from one sect and then from the other. It can easily be imagined how either party to this arrangement will look out for a young man of vigorous constitution as often as its turn comes round.

Dr. Sturtevant did not live to finish his autobiography, and the appendix by his son is mainly personal. We learn that he resigned his office in 1876, and that in 1883 he delivered an historical discourse on the fiftieth anniversary of the founding of the college. Some details from that discourse, comparing the grown-up college with its infancy, would have been welcome, but unfortunately they are withheld.

Chapters xv. and xx. are two of the most interesting in the book, though they are episodical. In the former, "The Negro," Dr. Sturtevant is at some pains to indicate his anti-slavery position. He was made an abolitionist by Garrison, but could not go with him the length of his anti-Union and non-voting declarations, and, although a clergyman, he misquotes the famous "covenant with death, etc." But apparently the Liberty party did not satisfy him, seeing that he did not vote for President at all until 1848 (not 1849 as written), when he voted for Van Buren. There is warm praise for Elizur Wright, Charles B. Storrs, and Beriah Green. After Lovejoy's first press was thrown into the river at Alton, Mr. Sturtevant was one of a company discussing the advisability of his getting another and going on with his work. He advised against it, and submits that he was more consistent than those who retreated from their position after Lovejoy's death. If they were right in urging resistance before that event, he thinks they would have been doubly right after the catastrophe. President Beecher was at Alton just before the riot, and received the new press at night with Lovejoy, and stood guard over it with him until morning, and then returned to his college duties, escaping in this way a dangerous situation and, perhaps, a martyr's crown. Mr. Sturtevant's anti-slavery enthusiasm is, however, reserved for the rise and growth of the Republican party. He dwells at length on Lincoln, whom he knew very well, but adds little to our knowledge of his history. Especially futile is his endeavor to establish Lincoln's Christian character. But it has this advantage over some hundreds of others: it concedes that if the churches had been more religious and less theological, Mr. Lincoln would probably have thought better of them, and have joined one or another. In fact the simplicity of religion, as compared with the complexity of the creeds, appears to have been the one lesson which Dr. Sturtevant learned as he did no other. It is the lesson that he teaches most impressively.

Medical Climatology. By S. Edwin Solly, M.D. Philadelphia: Lea Brothers. 1897.

Two Health-Seekers in Southern California. By William A. Edwards, M.D., and Beatrice Harraden. Philadelphia: Lippincott. 1897.

Dr. Solly's 'Medical Climatology' is a declaration of principles followed by a fair directory of the health resorts of the world. Very properly the author makes much of the action of sunlight, laying stress upon the germicidal influence of direct insolation, and upon its general invigorating power. The best example on a great scale of the vivifying influence of light, not noted herein, is the extraordinary stimulus its annual return gives to arctic animal life. There the reappearing sun excites emotional as well as invigorates physical existence, and the coming of the nightless day is marked by storms of passion and by other outbursts of restlessness and energy. Taking the whole globe under review, much of the detail in this work is necessarily meagre, but in all important respects the accounts seem trustworthy. The Rocky Mountain region is brought into particular prominence by its possession of the special quantities of abundant sunlight, low relative humidity, and freedom from atmospheric impurities, which are the essentials of a consumptive's climate; for, after all, the consumptives outnumber all others who change their skies in the hope of bringing strength to their bodies and rest to their minds. A comparison of Davos-Platz, which may be taken as the best of such European resorts, shows that on the first of January it has not quite four hours of possible sunshine against a little more than nine at Denver. The average relative humidity for the autumn and winter is 81 at Davos, against 50.5 at Denver; in January it was 86 abroad to 39 at home. The precipitation for the six colder months is 11.24 inches on 53 days at Davos, against 6.79 inches on 28 days at Denver. There may be other points in Colorado that make a better showing than Denver, but at their best the Alps are not as health-restoring as the Rockies. The book is well made, and has nearly a dozen maps, climatic rather than topographical. There are a few blemishes, as Saginaw for Saguenay (p. 189); Forts Yuma and Defiance, abandoned interior military posts, noted as having a present existence; bald, gazetteer-like entries of no real value except as names; no reference to the Catskills or the high Sierras; and the very serious defect of commonly failing to cite the page of authorities used.

In the second book on the same subject specialized, Miss Harraden reminds one that, notwithstanding the wonderful attractions of air and sky and distant scenery, country life for an invalid or for a woman means horses and servants or collapse. Dr. Edwards's claim is for the best yearly climate in the world, not absolutely the best in every particular all the time. His warning is that every health-seeker should not take some one else's climate, but by patient and intelligent exploration find his own. To seek health in California, or anywhere, except as resting in the convalescence from acute illness, means long-continued if not perpetual residence, with the reasonable precautions of food, moderate exercise, and freedom from special care. When these conditions are attained, life that is worth nothing in some climates is renewed and maintained there. But where almost every square league has individual characteristics, it is absurd for an invalid to settle thoughtlessly anywhere south of Point Conception, assured that the whole region is a terrestrial paradise.

Southern California is a paradise, but not a paradise for fools; and neither the glories of the sky nor the splendors of the ocean can replace judgment. With the exercise of judgment and the possession of some capital, a tranquil, happy, and prolonged life may be expected in suitable cases. As mere description, regardless of any utilitarian question, the little volume charmingly sets forth the advantages and honestly states the disadvantages of that unique country. As a guide-book for the chronic invalid, it makes the way plain. The last two chapters, on those who are and those who are not benefited by the climate, are eminently serviceable.

The Literary Movement in France during the Nineteenth Century. By Georges Pellissier. Authorized English Version, by Anne Garrison Brinton. With general introduction. G. P. Putnam's Sons.

M. Pellissier's volume, soon after its appearance in 1889, called forth from the pen of M. Brunetière another treatise on the same subject, covering a large part of his volume, 'Nouvelles Questions de Critique.' Emphasizing the influence of writers whom the younger critic had underrated (Voltaire, Buffon), abating the overestimated importance of others (Diderot, Chénier), supplying additional causes for the rise or decline of the classic, romantic, realistic, and naturalistic schools, criticising points of detail, rarely advancing views radically different from M. Pellissier's (as in the case of 'Madame Bovary')—M. Brunetière's essay forms an important supplement to the larger work of M. Pellissier, while at the same time showing its real value.

To welcome in its first English version M. Pellissier's philosophical study of the successive phases of French literature in the present century, appearing, as it does, in a garb most attractive by its combined elegance and good taste, would be as pleasant a task as could fall to the reviewer's lot. In these times of university extension movements, Chautauqua reading circles, and ladies' literary clubs, there is need of English editions of just such serious books as the present one. It is, therefore, to our sincere regret that we feel compelled to characterize the translator's performance as quite inadequate. A few specimens will suffice to bear us out in this summary judgment.

The very first sentences of the Introduction (which is lacking in lucidity), purporting to be translated from Brunetière, read: "M. G. Pellissier's *Mouvement Littéraire au XIXe siècle* is no less the picture than the history of contemporary French literature. In addition, it is also the philosophy, or rather describes the evolution of the literary movement of our century." In truth, Brunetière says, in substance: "M. P. has given us in his book neither a picture nor the history of the literary movement in the nineteenth century, . . . but rather its philosophy, or, still better, its evolution" ('Nouvelles Questions de Critique,' p. 153). Pellissier writes (p. 7, edition of 1889): "Le XVIIe siècle ne saisit par mieux Homère que Pindare. Ce qu'on [that is, the writers of the 17th century] lui reproche, c'est justement ce que nous goûtons le plus dans son épopée." The second clause, in the English version, reads (p. 9): "What *we miss in them* is exactly what we like best . . . ," and so the translator continues through several sentences, attributing to us moderns the literary judgment and taste of the French 17th century critics. On page 13, "On passe son amour conjugal à Andromaque parcequ'Hector n'est plus" is rendered: "Conjugal affection is passed over to A.," where it should be "forgiven," "condoned." Page 16, "When poets rhyme about old age, about the Psalms, etc.," should be: "If many poets, as old age approaches [*sur leur vieillesse*], put in rhyme the Psalms," etc.

Among unwarranted omissions of words and phrases we notice: Page 10, line 3 from bottom, after "His distinctive characteristics are perfect manners," the English for "une mesure exquise" is left out; p. 12, l. 22, "la risée des honnêtes gens" is translated simply by "ridicule"; p. 13, l. 11, after "protects himself" the phrase "par une jalouse étiquette" is omitted in the translation. At other times, words are added by the translator which slightly, or even seriously, affect the meaning; thus, p. 15, in "for she has no secrets for them," the conjunction is wanting in the original; p. 17, l. 1, there is no reason why "et" should be translated by "moreover," beginning a new sentence. On p. 12, l. 8, "whenever" should be "even when" (*lors même que*); p. 15, l. 21, "in effect" is given for "en effet"; p. 16, l. 19, "So also is he" does not render "Aussi resta-t-il"; nor (in the last line) is "also that Athalie" the equivalent of "et, quant à Athalie." We further call attention to such slips as "the careful *arrangement* of contiguous propositions *announce* and *lead* up to" (p. 17), and to constructions like this: "This reason, upon which Racine congratulates Corneille for having been the first to place on the stage, upon which Voltaire will, in turn, commend Bourdaloue for having been the first to preach from the pulpit, Perrault carries into fairy tales, and is also exacted by Boileau from the *chanson*" (p. 18).

These quotations do not exhaust the defects to be found in the first chapter of twenty-one pages. A cursory examination of the remaining portions of the volume does not disclose any essentially superior skill or care in translation. It remains to be said, however, that, in spite of its many errors, the book will furnish to English readers the best means available for gaining an insight into the nature and relations of the principal currents of modern French literature. There are passages in which the *traduttore* will prove to be a *traditore*, but in the majority of cases the mistakes are not serious enough to falsify the meaning of the original. And as to the style, it is generally fluent, and felicitous renderings are not rare.

Student's Dictionary of Anglo-Saxon. By Henry Sweet. Macmillan.

The condition of Anglo-Saxon lexicography is "a curse, an hissing, and a reproach." Bosworth is so bad that a distinguished German philologist has been known to congratulate himself, in print, on not possessing it. Ettmüller is both tormenting and obsolete. Bosworth-Toller is neither fish nor flesh, and, though indispensable, has called forth more just wrath from the long-suffering student than any other book of its inches. Besides, Bosworth-Toller seems to be hopelessly stuck in the letter S. Clark-Hall is useful, but dreadfully inaccurate. Grein alone can be consulted with comfort and satisfaction, and the advance of knowledge has made a thorough revision of even Grein devoutly to be hoped for. At this juncture Dr. Henry Sweet offers us a 'Student's Dictionary of Anglo-Saxon,' which is very welcome, like everything which Dr. Sweet writes, but which, after all, excites feelings rather of regret than of gratulation. What the world wants of Dr. Sweet is not a two-hundred-page dictionary, but a thesaurus. It was somebody's plain duty years ago to set Dr. Sweet at a great Anglo-Saxon dictionary. Instead, Prof. Toller was bidden to complete Bosworth, and then Dr. Sweet was asked to prepare an abridgment! However, it is too late to find fault with the Delegates of the Clarendon Press, if, indeed, they are to blame. We are ready to make the best of that queer conglomerate, Bosworth-Toller—if only the Press will give us the long-deferred last part—and to extend to Dr. Sweet's little book, which will be enormously useful, the greeting it deserves.

Like all of Dr. Sweet's books, however, this Student's Dictionary is rather hard to use. He has devised a most ingenious system of condensation, and, as a result, he has packed more into this smallish volume than most lexicographers would have got into a book of double its size. But it takes some time to learn his conventions, and one would willingly pay half a dollar more and have less trouble. Of the scholarship of the book it is unnecessary to speak: Dr. Sweet's name is surety enough. Yet we could wish more attention had been paid to the poetical texts, and in particular to the recent critical studies to which many of them have been subjected. Such attention would have modified a considerable number of the articles.

The dictionary, though sold at a low price, is well printed and far from unsightly; but the paper, we regret to observe, will not take ink.

On Veldt and Farm. By Frances Macnab. Edward Arnold. 1897.

The first impression one gets of this work is unfavorable. We see that the writer has merely travelled about South Africa, picking up miscellaneous information which, with little attempt to weigh it, she imparts to the public. Whereas her views on many questions are the undigested partisan ones of the people with whom she came most in contact, she abounds in lofty counsel and thin generalization. In politics, of course, she echoes the usual complaints of colonists against the home Government, without showing any grasp of the difficulties of the subject; she continually attacks the Boers (if she knew Dutch she might have heard a little more of their side of the case), she warmly admires Cecil Rhodes, and she indulges in such stuff as "the Pharaoh of Pretoria with the usual near-sightedness of a mere tyrant," and "It is impossible to believe that Paul Krüger is anxious, as he pretends to be, to promote the true interests of South Africa." In short, it is the complacent shallowness of the ordinary rambling journalist, unconvincing to any one who does not agree with her already. The style, too, is commonplace and frequently trivial.

However, as we get on, we admit that the volume contains a good deal of scrappy information about a country which is exciting

much interest at the present day. We may not trust the author, but she does seem to mean well, striving to describe the various resources of South Africa and what may be hoped from them, with a measure of success, and in a tone that improves as she gets away from politics. She is, in the main, enthusiastic about the country, but the reader cannot help being struck with its drawbacks, even over and above those common to all new regions.

"South Africa is the land of variety and of sudden, sharp contrasts. This is exemplified, not merely in the sphere of humanity by the black and white races, or by the phlegmatic, mediæval Boer and the *fin-de-siècle* civil engineer, but the climate possesses the same peculiarity. If one day is unearthly in loveliness and serenity, the next is certain to be visited with that unparalleled curse—a dust-storm. Then, when it rains it is a deluge, and the land is swept by rivers which yesterday did not exist. When the plague of floods subsides, a wind follows, and the appalling plague of thirst. It is a land where grasses are so rich that cattle grow fat in the open veldt. But the scourge of mysterious diseases afflicts them, and they drag paralyzed limbs and emaciated bodies through acres of rich pasture."

The farmer finds it hard to prosper permanently under such circumstances. Then, too, in spite of irrigation, most of the land does not seem well suited to wheat, which "is not a successful crop in Africa generally, and it is open to doubt whether, under the most improved methods, it may be possible to grow sufficient for the colony's consumption." Wine-growing has not been very prosperous of recent years, any more than ostrich farming; still, "There are few features in South Africa which it is more agreeable to dwell upon than Drakenstein hock, and certainly none which has about it greater appearance of an immense success in the immediate future." Unluckily, several countries in these days have golden dreams of making and exporting wines, for which the demand is by no means unlimited. The author speaks of mining only incidentally, being evidently much more interested in agriculture. We may leave it to those whom it concerns to appraise the value of the advice she offers to all sorts of intending settlers.

In conclusion, the publisher deserves thanks for giving us a volume so easy to hold as the present one. We hope that the example will be generally followed, for good print and paper need not mean, as they so often do, a disagreeable weight in the hand.

An Illustrated Flora of the Northern United States, Canada, and the British Possessions, from Newfoundland to the Parallel of the Southern Boundary of Virginia, and from the Atlantic Ocean westward to the 102d Meridian. By Nathaniel Lord Britton, Ph.D., Emeritus Professor of Botany in Columbia University, and Director in Chief of the New York Botanical Garden, and Hon. Addison Brown, President of the Torrey Botanical Club. The descriptive text chiefly prepared by Professor Britton, with the assistance of specialists in several groups; the figures also drawn under his supervision. In three volumes. Vol. II. Portulacaceæ to Menyanthaceæ. Portulaca to Buckbean. Charles Scribner's Sons. 1897.

This, the second, volume of a treatise already noticed in our pages, fully keeps the promise of the first. The typographical execution is, in all respects, as good, and the illustrations are as profuse. In some instances, the engravings strike us as better than their predecessors; the contrasting characters having been selected with greater care, and depicted with greater emphasis. Concerning the nomenclature and the subdividing of orders, genera, and species, largely matters of judgment, we are not wholly in accord with the treatise, and we believe that many of the decisions in the work will not stand the test of time; but these questions are too technical to interest our readers. Therefore, we shall content ourselves with a reiterated general protest against what appears to us to be precipitate and unwise action, which will by and by require a retracing of the steps. We cannot avoid the conviction that a more conservative course, both in regard to names and to ultimate divisions under genera, would have increased the permanent value of the work.

The arrangement of orders is, as we have noticed before, that of the lamented Eichler, adopted and largely modified by his successor Engler and associates. At least three arrangements, based essentially on Eichler's suggestions, are now in print. The one here chosen is on some accounts the best for present use, and we are glad it has been employed. That great changes in classification are impending, there can be little doubt; each system is an attempt to accomplish an impossible task, namely, to represent in terms of one dimension innumerable relations in space and time. Hanstein, one of the most gifted botanical philosophers, endeavored to construct in a new fashion the family tree of plants, and, in so doing, revealed to his contemporaries relations which had hardly before been suspected. The privately printed sketch which he placed in the hands of his pupils has been valued as a revelation, and has had much to do with the present attitude of systematic botany in Germany. The adoption of one of the stimulating systems which have grown out of Hanstein's and of Eichler's study, will certainly be of service here, and we approve this heartily. The juxtapositions of orders seem sometimes unnatural, but they are, for the most part, founded on dominant relations which ought to come out clearly.

There are two other matters which, though on a different plane, deserve hearty commendation, namely, the care which has been given to accentuation and to trivial names. There is likely to be criticism enough, and to spare, in relation to the general questions of specific names and treatment; but the fact should be kept clearly in mind that the authors have given botanists a treatise of exceptionally attractive appearance at a marvellously low price. Even without accepting the questionable specific names and without adopting the splintering policy in the management of genera, the work can be of convenience to every active amateur and professional botanist.

A Glossary of Indian Terms. By G. Temple. London: Luzac & Co. 1897. Royal 8vo, pp. 332.

This work may prove helpful in several ways, not merely to the specialist in the field of Eastern research, but also to general readers of literature, the works of Rudyard Kipling, and of such authors as lay their scenes in India. Students of Oriental travel may find something serviceable in its pages; and those who are engaged in trade with the East Indies might occasionally turn to the volume with profit if it were on the office shelf. To a young Englishman going into the civil service, one might conceive of such a book's becoming indispensable. In short, the glossary comprises terms relating to "religion, customs, government, land, and other terms and words in common use."

A glance at the definitions under such entries as "rupīya" (rupee, coin), "Ramazān" (the Mohammedan Lenten season), "satī" (suttee, widow-burning), is instructive. One also finds that "Fars, Fārsi" (Persia, Persian), "Gabr" (fire-worshipper), "Dozakh" (hell) are included; but "Dakhma" (Tower of Silence) seems to be missing among Perso-Indian terms that have grown familiar from the Parsis of Bombay. Some cross-references might have been added with advantage; the reader, for example, must look for "Juggernāth" (Jagannāth) under Rath-jātra (festival of the procession of the car). The specialist may notice several points for slight correction, and then he will join with others in thanking author and publishers for producing a book which is of use.

Teachers, etc.

AN EPISCOPALIAN CLERGYMAN wishes to receive into his family two youths or young men for preparation for or the forwarding in their college or other educational course. An exceptional climate permits such work under the most favorable conditions, and the most thorough, conscientious oversight of study, as well as instruction, is assured. The pupils of the gentleman have always gone beyond their class, and have attained fine physical condition.
Golf, tennis, and basketball clubs afford means of daily outdoor exercise; instruction and practice in horseback riding, with so much of the military setting-up drill as the daily inspection by a fine physician connected with the U. S. Army deems conducive to health and of use in forming an erect, easy carriage; lessons in dancing and attendance (unless otherwise desired) at the informal post hops are great factors in the same direction. A large, well-furnished house, abundant, pure water, well-ventilated sleeping room, good library, quiet, refined home life; abundant, well-served table, and constant, careful supervision of clothing, and everything conducive to the comfort of pupils will be given.
The terms, including use of a piano if desired, instruction in German and French by native teachers, are one thousand dollars ($1,000) per year, one-half in advance, balance at the commencement of last half of year. Will take them September or earlier if desired. Address "INSTRUCTOR," Fort Logan, Colorado.
Full particulars given by mail, or will welcome a personal discussion if desired.

A SPECIALIST IN MODERN LANguages, History, Literature, and Political Science, native of Hanover, Germany, Ph.D., A.M., Graduate of Vienna, Paris, and Kentucky Universities, desires a professorship in a good college; 20 years' experience; finest references; moderate salary. Apply WINFIELD BUSINESS AND ACADEMIC COLLEGE, Winfield, Kansas.

A VERY SUCCESSFUL TEACHER, having given up his position for the special study of Greek and German abroad, is open for an engagement. Would also teach Latin or History. Best references. PH.D., care of the *Nation*.

TUTORING IN MATHEMATICS, ASTronomy, and Physics at pupil's residence F. H. SAFFORD, Ph.D., Instructor in Harvard University. Address Box 45, Andover, Mass.

AMERICAN SCHOOLBOYS to Sixteen.—A Talk with Parents on a Course of Education, by EDWARD ROTH, A.M. 30 pp. Mailed to any address on receipt of 10 cts. 1135 Pine St., Philadelphia.

Garden and Forest Publishing Co.
Tribune Building, NEW YORK.

William Penn's Plan for the United States of Europe.

In 1693, one hundred years before Kant wrote his "Eternal Peace," William Penn published a remarkable "Essay towards the Present and Future Peace of Europe," proposing a general union of the nations of Europe, with a federal parliament, as the only sure means of peace. This great essay, almost forgotten, is now added to the Old South Leaflets, being No. 75 in the series. The interest in international arbitration is so great that this essay should be read everywhere. Price, 5 cents a copy; $4 a hundred. Three bound volumes of the Leaflets now ready. Price, $1.50 each. Send for complete lists.

READY THIS WEEK.

Hall Caine's New Romance.

THE CHRISTIAN.

By HALL CAINE, Author of "The Manxman," "The Deemster," "The Bondman," etc.

12mo. Cloth, $1.50.

"So much has been heard of Mr. Hall Caine's new story that one expects a good deal. But the public is hardly prepared for so remarkable a performance as 'The Christian.' It is a great social panorama, crowded with living figures, phases of life, color, and incidents. All these are knit together and made live by constant action. There is not a lay figure in the book; every man and woman is a living, breathing, thinking, acting creature. . . . As great as 'The Christian' undoubtedly is, considered as a portrayal of certain portions of the social fabric, it is even greater when considered as a story. . . . 'The Christian' will almost certainly be the book of the year. It is a permanent addition to English literature. It is bound to be very popular, but it is above and beyond any popularity that is merely temporal."—*Boston Herald.*

SECOND EDITION.

Equality.

By EDWARD BELLAMY, author of "Looking Backward," "Dr. Heidenhoff's Process," etc. 12mo. Cloth, $1.25.

"It is a greater book than 'Looking Backward,' while it is more powerful; and the smoothness, the never-failing interest, the limpid clearness, and the simplicity of the argument, and the timeliness, will make it extremely popular. Here is a book that every one will read and enjoy."—*Boston Herald.*

"'Equality' will raise many discussions. The subject which Mr. Bellamy writes about is inexhaustible, and it has never-failing human interest."—*New York Times.*

"Deserves praise for its completeness. It shows the thought and work of years. It apparently treats of every phase of the subject. . . . Altogether praiseworthy and quite remarkable."—*Chicago Tribune.*

Peter the Great.

By K. WALISZEWSKI, author of "The Romance of an Empress" (Catherine II. of Russia). Translated by Lady Mary Loyd. Uniform edition. Small 8vo. Cloth, with portrait, $2 00.

"One of the most interesting biographies of the historical kind we have read for a long time. . . . Intensely interesting because absolutely unique."—*London Daily Chronicle.*

"It is a marvellous story—this of Peter the Great—and it has been told with great spirit by the author."—*London Saturday Review.*

"A finished and artistic portrait of this extraordinary man. . . . An elaborate character sketch."—*London Standard.*

Familiar Features of the Roadside.

By F. SCHUYLER MATHEWS, author of "Familiar Flowers of Field and Garden," "Familiar Trees and Their Leaves," etc. With 130 Illustrations by the Author. 12mo. Cloth, $1.75.

"One who rides, drives, or walks into the country will find this book an invaluable and incessant source of elevating amusement. . . . It is enough to make any reader an enthusiast in the special field of natural history which this book exploits."—*Philadelphia Press.*

Insect Life.

By JOHN HENRY COMSTOCK, Professor of Entomology in Cornell University. With Illustrations by ANNA BOTSFORD COMSTOCK, member of the Society of American Wood Engravers. 12mo. Cloth, $2 50.

"Any one who will go through the work with fidelity will be rewarded by a knowledge of insect life which will be of pleasure and of benefit to him at all seasons, and will give an increased charm to the days or weeks spent each summer outside the great cities. It is the best book of its class which has yet appeared."—*N. Y. Mail and Express.*

Some Unrecognized Laws of Nature.

An Inquiry into the Causes of Physical Phenomena, with Special Reference to Gravitation. By IGNATIUS SINGER and LEWIS H. BERENS. Illustrated. 12mo. Cloth. $2.50.

HAMLIN GARLAND'S NEW BOOK.

Wayside Courtships.

By HAMLIN GARLAND, author of "A Spoil of Office," "A Member of the Third House," "Jason Edwards," etc. 12mo. Cloth, uniform edition, $1 25.

"In these stories Mr. Garland presents photographic impressions of the West, every one of which has pathos and power behind it, and virility and character to recommend it. The spell of romanticism overshadows them all; yet they are distinctly different in form and enthusiasm."—*Boston Herald.*

LATEST ISSUES IN

Appletons' Town and Country Library.

Each, 12mo. Cloth, $1.00; paper, 50 cents.

Mifanwy.

A Welsh Singer. By ALLEN RAINE.

This charming story opens in Wales, and shows a fresh and inviting local color. The later action passes in London, and also in Wales, and music and musical life play a leading part.

A Colonial Free-Lance.

By C. C. HOTCHKISS, author of "In Defiance of the King." No. 222, Town and Country Library. 12mo. Cloth, $1.00; paper, 50 cents.

The welcome given to "In Defiance of the King" proves the growth of American appreciation of new American writers of genuine talent. In this new romance of the Revolution Mr. Hotchkiss shows a power of sustained interest and a command of dramatic effects which will make his book a notable addition to our fiction. The scene of his stirring tale is laid for the most part in old New York during the British occupancy, on Long Island Sound, and on Martha's Vineyard. It is certain that no one who has begun this spirited and fascinating story will leave it unfinished.

For sale by all booksellers, or will be sent by mail on receipt of price by the publishers.

D. APPLETON AND COMPANY, 72 Fifth Avenue, New York.

Educational.

CALIFORNIA, Belmont. (In the foothills near San Francisco.)

BELMONT SCHOOL for Boys hopes to deserve the confidence of Eastern as well as of Western parents by surrounding its boys with as stimulating an intellectual, spiritual, and physical life as is found in the best Eastern schools, and by offering a home which in beauty of surroundings and fineness of climate for sustained work no Eastern school can hope to equal. It should give to its boys a healthful impulse towards good thinking and good living, and leave with them a heritage of pleasant and helpful memories.

The catalogue, containing views of the school and a record of the colleges and technical schools entered by its graduates, will help to give an idea of its spirit and the work it is doing

GINN & COMPANY, Publishers,

BOSTON. NEW YORK. CHICAGO. ATLANTA. LONDON.

LONGMANS, GREEN, & CO.'S NEW BOOKS.

TEACHING AND ORGANIZATION.

With Special Reference to Secondary Schools: A Manual of Practice. Edited by P. A. BARNETT, M.A. — pp., $2.00. [*Nearly Ready.*]

This book will contain 22 chapters, each by a competent authority, the following being the list of subjects:

The Criterion in Education.
Organization and Curricula (*in boys' schools*).
Kindergarten.
Reading.
Drawing and Writing.
Arithmetic and Mathematics.
English Grammar and Composition.
English Literature.
Modern History.
Ancient History.
Geography.
Classics.
Science.
Modern Languages.
Vocal Music.
Discipline.
Ineffectiveness in Teaching.
Specialization.
School Libraries.
School Hygiene.
Apparatus and Furniture.
Organization and Curricula (*in girls' schools*).

L'AIDE DE CAMP MARBOT.

Selections from the Memoires du General Baron de Marbot.

Edited, with Notes, by GRANVILLE SHARP, M.A., Late Assistant Master at Marlborough College. 12mo, *net*, 80 cents. [*Just Ready*]

Selections for school reading are here given from the "Memories of General Marbot" which, since they were published six years ago, have run through more than forty editions. The French is simple and unpretentious, and nearly fifty pages of historical notes are given at the end of the volume.

PROBLEMS IN GEOMETRY.

Numerical Problems in Plane Geometry, with Metric and Logarithmic Tables. By J. G. ESTILL of the Hotchkiss School, Lakeville, Conn. Crown 8vo, 144 pages, $0 90. [*Lately Published.*]

Designed to meet the new admission requirements for Yale, and the recommendation of the conference of leading Colleges and Preparatory Schools recently held in New York.

"Exactly the book needed."—ARTHUR CUTLER, The Cutler School, N. Y.

"A special word of praise is due for the admirable treatment of the subject of logarithms."—WILSON FARRAND, Newark Academy.

A COURSE OF PRACTICAL CHEMISTRY.

By M. M. PATTISON MUIR, M. A., Fellow and Prælector in Chemistry of Gonville & Caius College, Cambridge. PART I. ELEMENTARY. 12mo, 133 pages, $1.50. [*Nearly Ready.*]

NEW NOVEL BY THE AUTHOR OF "THE HONOUR OF SAVELLI."

THE CHEVALIER D'AURIAC. A Romance.

By S. LEVETT-YEATS, author of "The Honour of Savelli," etc., etc. 12mo, cloth, ornamental, $1.25.

"'The Chevalier d'Auriac' confirms the impression made by its predecessor that Mr. Yeats is a worthy rival of Mr Stanley Weyman in the field of historical romance. Nothing so stirring and exciting has come to us since 'A Gentleman of France' or 'Under the Red Robe.'"—*Bookman, New York.*

NEW BOOK BY SAMUEL R. GARDINER, D.C.L.

CROMWELL'S PLACE IN HISTORY.

Founded on Six Lectures delivered in the University of Oxford. By S. R. GARDINER, D.C.L., Ford's Lecturer in English History, 1896. Crown 8vo, 120 pages, $1.00.

WHAT GUNPOWDER PLOT WAS.

A Reply to Father Gerard.

By S. R. GARDINER, D.C.L. Crown 8vo, 216 pages. With Illustrations, $1.50.

CONTENTS:—I. Historical Evidence—II. Guy Fawkes's Story—III. The Later Documentary Evidence—IV. Structural Difficulties—V. The Discovery—VI. The Government and the Catholics—VII. The Government and the Priests.

LIST OF ILLUSTRATIONS: *Frontispiece*—View of the River Front of the House occupied by Whynniard—From a Plan of the Ancient Palace of Westminster—From a Plan of Part of Westminster, 1685—From a Plan of Part of Westminster, 1739—From a Plan of Westminster Hall and the Houses of Parliament, 1761—East End of the Prince's Chamber—Views of the East Side of the House of Lords, etc.—The Four Walls of the So-called Cellar under the House of Lords.

A DESCRIPTION OF THE WORDSWORTH AND COLERIDGE MANUSCRIPTS

In the Possession of Mr. T. Norton Longman.

Edited, with notes, by W. HALE WHITE. With Three Facsimile Reproductions: "The Brothers" and Letter from W. Wordsworth to Humphrey Davy—Coleridge's "Love"—"The Ode to Immortality." 4to. $3.50.

". . . A handsome and indispensable addition to the library of every lover of Wordsworth."—*The Athenæum.*

Sold by booksellers. Sent, postpaid, on receipt of price.

LONGMANS, GREEN, & CO., Publishers, 91-93 Fifth Ave., New York.

The Nation.

NEW YORK, THURSDAY, AUGUST 12, 1897.

The Week.

The Sound-Money Democrats of Ohio will follow the example set by their brethren in Michigan, Iowa, and Kentucky. The State central committee of the National Democracy held a meeting on Thursday, and appointed a convention at Columbus next month to nominate a full State ticket. The committee were unanimous in this decision, and it will be heartily endorsed by Democrats of the same faith throughout the country. A standard ought to be raised in every State where an election is to be held which will rally voters who cannot accept the platform of either Republicans or Bryanites. The National Democrats of Ohio can "stand up and be counted" for a State ticket, with perfect assurance that such action will prove for the public good. As regards legislative tickets, the question in each district will be one for the independent voter to decide according to local conditions, and it may be taken for granted that he will nowhere contribute to the election to the Senate of a man so bitterly opposed to the sound-money cause as must be any Senator who should be chosen by a Bryanite Legislature.

The Iowa campaign has already progressed far enough to show that successful fusion between the Bryan Democrats and the Populists is impossible. It was much against their will that a large proportion of the Populists throughout the country supported the Democratic Presidential ticket last year, and a significant number refused to swallow Sewall, 15,181 ballots being cast for Bryan and Watson in Massachusetts, for example, as against 90,530 for Bryan and Sewall. The "Middle-of-the-Road" men of 1896 have received accessions in 1897, and in Iowa five of the eleven members of the Populist State central committee have declared against supporting the fusion ticket put in the field a few weeks ago by the Bryan Democrats, the Silver Republicans, and the Populists, who held conventions at the same time. These leaders evidently find much following among the rank and file, for we observe that in two Populist county conventions held in one day recently there were splits on the question of fusion, a large majority in one case opposing any further union with the Bryan Democrats. Only a few States hold elections this year, so that the sentiment of the Populists regarding fusion cannot be generally expressed; but there is no doubt that like causes must produce like results everywhere in the Congressional elections of next year. The Chicago platform never satisfied the thoroughgoing Populist; free coinage at 16 to 1 was well enough in his view, but it was a mere trifle compared with what he really wanted in the way of "financial reform." Moreover, the honest member of this party has no more faith in Democracy than in Republicanism, and is as loath to boost into office one set of politicians as the other. The attempt of the fusionists to stay the stampede in Iowa does not succeed because, when they warn the come-outers that such action will help the Republican party, the "Middle-of-the-Road" men reply that the other course will help the Democratic, and they would as soon assist one of these equally objectionable organizations as the other. It is already evident that the fusion game can never again be played on so large and successful a scale as in the national canvass of last year.

The election in Tennessee on Thursday was a fresh illustration of the difficulty so often experienced in interesting voters in what are really the most important of all questions—as to the kind of constitution under which they shall live. For more than a quarter of a century that State has gone on under a constitution which was framed in the stormy times of the reconstruction period, and which has come to be the shelter of gross abuses. The necessity of radical changes has been recognized by progressive citizens for years, but long agitation was required before the Legislature could be induced even to submit to the people the question whether a convention should be called to frame a new constitution. Thursday was the time set for the decision, and the result shows that the advocates of reform had not appreciated the degree of inertia to be overcome in their conservative community, for the vote was the lightest polled in the State for a generation, and the proposition for a convention was overwhelmingly defeated.

The press was furnished last week with what purported to be literal extracts from the injunction against the striking miners obtained from the United States Court in West Virginia. According to these extracts the prohibitions were nearly as extensive as those of a mediæval statute against treason. The miners were enjoined from interfering "by word or deed" with the affairs of a coal company, and might as well have been forbidden altogether to imagine any mischief against it. But if we may depend upon the accuracy of a copy of the injunction which was published on Monday by the New York *Sun*, what the court orders Debs and his companions to refrain from is interference with the operation of a coal-mine by menaces, threats, and other intimidation directed against the miners employed therein, especially while they are going to or from the mine. There is no prohibition of meetings in the public highways; it is the paths and roads on the property of the coal company which are to be kept clear. There is no general injunction against trespassing, but a particular warning not to enter on the property of the coal company for the purpose of interfering with or intimidating its employees, or of holding meetings to induce them to quit their work. The injunction does not even forbid urging the miners to strike, but only the "unlawfully" inciting them to do so. While it is evident that the police ought to prevent all the acts enjoined without any action by the courts, it is equally evident that no natural or constitutional right is menaced by such an injunction as seems to have been actually issued.

Perhaps the most noteworthy thing about the coal-miners' strike is the orderly way in which it has been conducted. It is now more than a month old and involves thousands of miners in four or five States; yet, except for an occasional and isolated act of violence, the efforts of the leaders to keep the peace and respect public order have been remarkably successful. We doubt if so prolonged a strike, on so large a scale, ever before occurred in this country without producing more public disturbance—assaults and rioting. This is the more notable in that the strikers have had the open sympathy of the Governors of West Virginia and Illinois—Republicans both. It has been as good as intimated to the strikers that the military power of those States would be used against them only in case of dire necessity. But no such necessity has arisen, and everybody must hope it will not. The leaders of the men have learned the great lesson that public sympathy for them, however keen, will speedily be alienated by public disorder. This is a teaching of the events of the summer of 1894, in connection with the great railroad strike, which laboring men have apparently taken to heart. It is a great gain every way. Whether the strikers win or lose, they have, so far, managed their strike in the way to convince the public that they value the orderly administration of the law.

The latest Hawaiian rumors would seem incredible if any rumor about the

foreign policy of the present administration could longer seem incredible. It appears most unlikely that, with a treaty of annexation pending, the President should decide to annex by the short and easy method of running up the flag; but the treaty of annexation itself appeared most unlikely, after what Mr. McKinley had said of it in public and private. The reasons alleged for declaring a "protectorate" at this time are preposterous; unless the American flag is hoisted, it is said, the islands will not be able to maintain themselves against Japan while awaiting the slow process of annexation by treaty. But Japan has formally and explicitly declared that she has no hostile designs upon Hawaii. The only question between them is a claim for indemnity arising out of the refusal to allow Japanese immigrants to land in Honolulu, and that question has been submitted to arbitration. If annexation by ship and gun and flag has been determined upon, it is only because the men whose personal interests are at stake have come to believe that annexation by treaty cannot be secured. They argue that the flag once up will never be pulled down, treaty or no treaty. All this is conjecture, of course, and there may be nothing whatever in the rumors. They would be dismissed as wildly improbable had not the vacillating conduct of our foreign affairs during the past five months prepared us to believe anything. "Nothing is impossible on Bunker Hill," said Webster; and nothing is impossible to a diplomacy which has tricked the Japanese Minister and written the Sherman despatch about the seals.

What dreadful people those Canadians are in the matter of tariffs, when they propose to collect duties on the provisions and outfit of miners going into their territory. Why don't they take pattern from us when they pass their tariff bills and allow $100 worth of such truck to come in free? An idea seems to prevail in some quarters that our will is law on this continent—an idea somewhat hastily thrown out by ex-Secretary Olney—and hence that Canada ought to square her ideas of protection to home industry by ours, or rather ought to abandon them altogether as regards gold-miners. The business men of Seattle seem to have this notion, and they want retaliation at once. But have we not retaliated sufficiently in the Dingley bill, by putting prohibitory duties on lumber, eggs, barley, fish, hay, and everything else we could think of to make the Canucks mad? It would be hard to see how we could do more. We might cut off the transit of Canadian goods in bond, but that would deprive our own railways of the business of carrying the goods. Great is protection, when you have it all your own way.

We have had occasion to refer before this to the unprecedented increase in this country's exports of manufactured goods. In the calendar year 1896, it will be remembered, the total of such exports showed an increase of $52,534,864 over 1895, or more than 25 per cent. The Bureau of Statistics has now compiled the record of manufactured exports for the twelve months ending June 30, 1897, comprising the fiscal year, and the record is even more remarkable. During these twelve months, aggregate exports of manufactured goods have risen to $276,357,861, against $228,571,178 in the same months of the year preceding, $183,595,743 in the fiscal year 1895, and only $151,102,376 in 1890. Moreover, this increase has been continuous throughout the last twelve months. During the six months beginning last January, manufactured exports increased nearly $23,000,000 over the same six months of 1896, and $50,000,000 over 1895. The importance of these growing exports of manufactures, during the fiscal year 1897, may be judged from the fact that, enormous as our shipment of cereals has been during the same twelve months, the manufactured exports exceeded the value of outgoing breadstuffs by $76,000,000, whereas in the corresponding period ending with June, 1892, breadstuffs exports ran beyond the shipment of manufactures by $141,000,000. In short, the manufactured exports of the fiscal year 1897 made up nearly 27 per cent. of the largest total export trade in the history of the United States.

Mr. Mulhall's review of the commerce of the last twenty years, which appears in the *Contemporary* for August, contains figures of stupendous magnitude. The year 1896 was, he says, the *annus mirabilis* of British trade, the value of exports and imports exceeding all previous records. Moreover, in spite of the alarm expressed concerning foreign competition, British trade amounted to 37 per cent. of that of the world, as compared with 36 per cent. in the year 1876. So far as values are concerned, the increase is not very striking. Taking the values of exports from the United Kingdom and of imports retained for consumption therein, their sum was in 1876 about £520,000,000, in 1886 only £506,000,000, and in 1896 nearly £625,000,000. But there has been an enormous cheapening of production and consequent fall in prices during these twenty years. If we consider quantities rather than values—and quantities are what we should look to in estimating the real wealth of a people—we find that the actual volume of this trade has increased 88 per cent. since 1876, or four times as much as population. In other words, had the prices of 1876 prevailed, the trade of 1896 would have been valued at £975,000,000 instead of two-thirds of that sum.

The Philadelphia *Ledger* learns that "the advocates of international bimetallism in Washington are much disturbed by the news from London that the British Government is not prepared at the present time to answer, favorably or unfavorably, the request that it should participate in an international conference to be called by the United States." The names of these disappointed persons are not given. Evidently they do not include any Bryanites of prominence, for the same paper says that the prospective failure of the negotiation gives the free-coinage men much pleasure. They must be very happily constituted if they can derive pleasure from anything just now. The whole world seems to be going against them. Senator Stewart has been roused from torpor by the recently published statistics of gold production by Mr. Preston, the Director of the Mint. The statistics he pronounces false and wicked. As to Preston's opinion that Mexico cannot pay the interest on her foreign debt if she maintains her silver standard, Stewart says that is all bosh, because Mexico pays the interest on her foreign debt with her products, and these products bring just as much gold in foreign countries as ever. Her coffee, her tobacco, her dyestuffs, her mahogany, and everything except her silver sell at as high prices as before. Yes, but she does not collect her taxes in coffee, tobacco, and dyestuffs, but in silver, and she pays the interest on her foreign debt with the proceeds of her taxes. Stewart naturally concludes that Preston is "recreant to his duty and an enemy of his country."

We presume that the bimetallists will indulge in some jubilation over the report of the minority of the British Royal Commission on Agriculture. Headed by Mr. Henry Chaplin, this minority declares that depression in agriculture is wholly due to the demonetization of silver; in proof of which they point out the particular severity of the depression in the United States. Of course the only remedy is the abandonment of the gold standard. It is somewhat unfortunate for Mr. Chaplin and his bimetallic friends, however, that their minority report was not filed a year or two ago. Coming as it now does on the heels of the 26 cents per bushel rise in wheat, the recovery of enterprise throughout our farming regions, and the daily sales of a good wheat crop by English farmers at equally high prices, the bimetallic report has a far-away sound which falls curiously on the ear.

Mr. Chaplin is, in fact, a very unlucky

prophet, a fact which his associates on the Agricultural Commission ought to have remembered. In the early spring of 1879, this same acute observer unfolded to Parliament the true cause of the depression in English agriculture. It was not due then to silver demonetization—that is one of Mr. Chaplin's more recent fads. It was occasioned wholly by the abandonment of high protective tariffs on grain, both by Great Britain and by its grain-producing neighbors. Until these high taxes were restored, Mr. Chaplin proceeded, low prices for wheat would rule. But the time for uttering this prophecy was as ill chosen in 1879 as in 1897. Within eight months of Mr. Chaplin's analysis of the situation, wheat had advanced some 50 cents a bushel in exporting countries, and England was only too happy, demonetization or no demonetization, to pay the price. It was an unforeseen deficiency, Mr. Chaplin's friends will answer, which turned the grain markets at the moment of his prophecies. Yes; the bimetallist is very willing to talk of unforeseen deficiencies in 1879 and 1897; but does anybody ever hear him speak of the huge unforeseen surplus product of 1878 and 1894?

It appears to have been assumed all along that England would join in a bimetallic conference on the basis of restoring the free coinage of silver in India and carrying a certain amount of that metal in the Bank's reserves. The authority for this assumption was the *National Review*, which, it now appears, was not charged with the task of declaring the policy of the Salisbury ministry. That task was assigned to Sir Michael Hicks-Beach, who said, when his opinion was asked, that her Majesty's Government could not give a decisive answer till October, because it was necessary to consult the Government of India on the subject. What shall we say to that? Is it not a subterfuge? Do we not know that England has absolute power over India and can change her coinage system every day in the week if she likes? What nonsense, then, to talk about waiting till October! How absurd to talk about consulting the Government of India! The Government of India, to all intents and purposes, is situated in Downing Street. Evidently there is a deep-laid scheme here, for we find that France immediately shows signs of weakness, and asks to be "counted out" altogether unless England joins. Meanwhile, our special commissioners are going to try their luck at Berlin and St. Petersburg, with dubious prospects in both.

The replies of the British colonies to Mr. Chamberlain's request for information as to the extent to which foreign imports are displacing those from England are in the usual vein of such communications. The foreigners are "making steady inroads." The English merchants do not consult the taste of their customers. German and American competitors furnish cheaper goods of improved finish, and threaten to capture the entire trade in certain articles. Of course these replies are just what Mr. Chamberlain wanted in order to lay the foundation for his imperial customs union, but Sir Wilfrid Laurier and Mr. Reid, the Premier of New South Wales, have upset the scheme. As a matter of fact these "foreign inroads" are a mere figment of the imagination. The gross returns of British trade prove that it is well maintained with her own colonies as well as with much of the rest of the world. Indeed, her colonial trade exhibits in some lines a wonderful development. Tea is associated in our minds with China, but a correspondent of the London *Times* calls attention to the prodigious advances that have taken place in the cultivation of the tea plant in the British possessions. So recently as 1868 China supplied England with about 100,000,000 pounds, while India sent 7,000,000 pounds. In 1896 England imported 227,000,000 pounds of tea, of which 24,000,000 pounds came from China, and the rest from India and Ceylon. This does not indicate that England's colonial trade is in a state of decay.

The Queen's speech proroguing Parliament makes no mention of the Bering Sea question, the Hawaiian question, the bimetallic conference, the Alaska boundary, the Klondike mines, the Hon. John W. Foster, the Hon. Whitelaw Reid, Senator Wolcott, or of the United States as a whole. It refers to Greece, Turkey, Belgium, Germany, China, and King Menelek. Is not this an intentional slight? May it not be the British way of answering the "shirt-sleeves despatch"? Should it not be considered a *casus belli?* We think that an explanation should be demanded at once, and that a time limit should be put upon the answer. Lord Salisbury has an exasperating way of dilly-dallying about matters involving our dignity. Ex-Secretary Olney can tell something about that. Salisbury should be asked whether the omission of all reference to the United States in the Queen's speech was intended as an affront. If he says that it was, or if he refuses to answer, then let war be declared as soon as the Indiana can be got out of the Halifax dry-dock. We are glad to see that Secretary Sherman, old as he is, stands ready, like Sir Peter Teazle, for every emergency. He is quoted in one morning paper as saying that "England quarrels oftener than she fights." That is so much like the shirt-sleeves despatch that its authenticity can hardly be doubted. The same newspaper quotes Mr. Foster as saying that he did not write the shirt-sleeves despatch and did not connive at its publication. Really our foreign affairs are getting into a deplorable state, and we see no way to rehabilitate them but by a little blood-letting. If the Hon. Theodore Roosevelt were Secretary of State, he would find the proper remedy.

The capture of Abu Hammed by the Anglo-Egyptian expedition completes another stage of the march to Khartum. The movement is slow but sure, and the overthrow of the Khalifa can be counted upon as absolutely certain. If it is of any use to "avenge Gordon," he will be avenged in due time. What is of use is the restoration of the Sudan to the influences of civilization, and the breaking of a tyranny, one of the most cruel and blighting that the world has ever known. Every step taken by the expeditionary force up the Nile is an additional reason why England should not abandon Egypt, and the public opinion of Europe will sustain her in retaining her hold upon it even though jealousy may linger in France and Germany. Abu Hammed is about equidistant with Khartum from the mouth of the Atbara, and controls a long stretch of navigable water.

Spain is still able to borrow money, as is shown by the success of her recent Philippine loan, subscribed for five times over. But the rebellion, insurrection, or whatever it is to be called, in the Philippine Islands drags along as discouragingly as does the Cuban revolt. An instructive article in the *Revue des Deux Mondes* for July 15, by M. Charles Benoist, lets in a great deal of light upon the Philippine difficulty, and upon Spanish politics in general. The great part still played in Spanish government by ecclesiastics is suggested by two incidents: four monks sitting in the Prime Minister's ante-chamber, and announcing that they had been invited by Cánovas to "talk over the political situation"; and a bishop entering the palace, summoned by the Queen, while grandees, generals, and ladies of honor knelt before him. It is such things, as M. Benoist says, that make one feel that the real Spain is still living in the sixteenth century. As far as foreign policy is concerned, this was admitted by a distinguished public man with whom the writer talked. "Without a break," said he, "we have for three hundred years tried to govern our colonies with monks and soldiers." This suggests the radical difficulty in all the talk about applying "reforms" to Cuba. The old Spanish idea of colonial government must first be reformed itself, and there are few signs that it has been. The condition of affairs both in Cuba and in the Philippines gives too much color to the depressing conclusion of M. Benoist: "The Spaniards have always known better how to fight and to die than to live and organize."

THE LOW PETITION.

The astonishing figures representing the number of signatures to the Low petition prove that, whatever may be the result of the coming election, the nominations for Mayor of New York are not likely to be managed in the future as they have been in the past. The body of voters demanding the nomination of Mr. Low, already reaching about 70,000, is as large as the genuine membership of the Republican machine, if not of Tammany Hall, while none of the smaller organizations can be mentioned in the same breath with it. We have always expressed the conviction that it would have this success, and indeed we may go further and say that for New York its ultimate triumph, as things stand, is as necessary as was the defeat of Bryan last year for the country at large. For everybody who has anything to lose, or cares about civilization, the election of a Platt Mayor, or of a Sheehan-Croker Mayor, or of a Platt-Sheehan-Croker Mayor, with a term of four years, in the commercial capital and principal city of the United States, would be an almost unendurable calamity. It would mean here a return for four years, if not longer, to barbarism, plunder, spoils, and blackmail, and at Albany a continuance of the carnival of deals, jobs, and steals, plunging the city continually into worse and worse disorder. But the Low movement, even at its present stage, is an assurance that no such future is before us. Every thousand signatures added to his petition makes it more and more impossible for his enemies to play the game they originally had intended. The Low petition is a loud and solemn warning that the voters of the city demand a man of established character and capacity, unfettered by pledges, and that, no matter who is put up, they will allow no other sort of man to be elected.

In this respect it differs from all similar previous movements. The movement against Tweed, for instance, was designed to eject a corrupt ring from power; the movement against the New Tammany had the same object in view. In neither case was the fact attended to that the nominating machinery left in existence would, if let alone, produce the old evils over again. But the Low petition represents a movement against the nominating machinery itself. It is a volunteer popular movement, not merely for a particular man, but to prevent the nomination by the machines of the type of man they want. It is a popular nomination, without a machine, of a candidate without a pledge—that is, it is the accomplishment under our eyes of that very impossible, unattainable thing which we have insisted, year in and year out, must be attained, if republican institutions were not to perish.

That a genuine popular nomination of this sort, in advance of any action by any regular political body, could be accomplished by a midsummer volunteer movement, is a phenomenon so novel in the history of New York and the country that we may be sure that it is significant of something much more important than the drift of a particular contest. Some critics can find in it only an exceptional effort made for an exceptional crisis—the election of the first Mayor under the charter of the enlarged city; but, unless we are mistaken, there is something in it more important than this—the undermining, in its citadel, of a rotten and outworn nominating system.

We have no word in our political vocabulary which corresponds to the old English "rotten borough," because we have not the thing. But we have in our nominating system a very similar product of corruption, for which we have invented the excellent word machine. Nominations are nominally made by a popularly chosen body known as a convention, but this convention is itself chosen in reality by small organized bodies of workers, who live in some way at the public expense, and whose paymaster, when they are not actually in office, is the boss, or treasurer of the whole corporation. In New York, and in Pennsylvania, and indeed in every rich, powerful community having a large city in it, he draws his funds either from blackmail or from the "voluntary contributions" of those who have a lively sense of gratitude for benefits which they expect him to confer, or dread of evils which they fear he may, if not appeased, inflict. There is nothing new, of course, in this description; what is new is that we are beginning to see clearly that it is chiefly through nominations to office that this machine exerts its power. Formerly the machine had great power, once in control, through the federal and State civil service; but this has been in great measure lost. The other day, when Mr. Bidwell was appointed Collector of this port, a tremendous to-do was made over it by Platt, because twenty years ago the collectorship was one of the keys to the control of the machine; but in reality most of the Collector's political power has vanished, through the application of civil-service reform to the custom-house. So when Black undertook to get hold of the State civil service, the plot was in a great measure defeated by the very heads of departments, who in former days would have been his tools. To-day the machine must continue in power through its control of elective offices, or it must disappear as a factor in politics.

We have become of late years so accustomed to machine nominations that we can hardly conceive of any other system. Yet the signs are many that the system is doomed, and the Low petition is one of them. That the system must disappear we have always believed, because it cannot be purified, and it is incompatible with free government. A machine with a boss at its head tends to absolutism and tyranny and the destruction of free speech and free thought in our system as inevitably as the old English rotten boroughs tended to produce the same results in the English parliamentary system a hundred years ago. All attempts to ameliorate it by exhortation of citizens to "attend the primaries," or by legislation to prevent corruption in the primaries, have broken down, and yet there is nothing more certain than that without good nominations to elective offices the whole government will ultimately become as rotten as the machines which call it into existence. No government can in the long run be any better than the men who carry it on; and our crying problem is how to get good men put up for election.

Our system of nominations, originally introduced as a democratic reform, has become in process of time essentially corrupt and tyrannical, leading to the domination of such creatures as Platt, Quay, and Gorman in the most intelligent and civilized communities in the country, and to such extraordinary phenomena as the capture of the whole machinery of a great national party in the interest of a sordid plot. Unless we are wrong in believing the United States to be a genuinely democratic country, this rotten system must be superseded by some new one that will give free play to the forces which underlie our civilization, and which on the whole make for improvement. What the new system will be, it is, of course, impossible to predict, but the Low petition shows one avenue of escape from machine rule, which will be hailed with delight.

HOW THEY DO IT IN FRANCE.

France, as protectionists of the classical school such as Carey and Greeley used to proclaim, was the first of European states to illustrate the theory of protection in a systematic manner. The legislation of Colbert was so well conceived as to furnish the basis of most subsequent customs acts; and while the French have had occasional lapses into something like free trade, they have as a rule maintained a protectionist policy. From the time when M. Thiers came in as President of the newly formed republic, this policy has prevailed in France without interruption and with increased intensity. No such revulsions have taken place there as occurred in this country in 1894, and we naturally turn to France for examples of the most perfect and complete development of protection so far produced. Such an example is furnished in the passage of the so-called *cadenas* (or padlock) bill.

This law provides that when any bill is presented by the Government to in-

crease the duty on corn, wine, cattle, or fresh meat, a decree shall be made applying the duty from the very next day. It further provides that the proceeds of such supplementary duties shall not become the property of the Treasury until the law has been enacted. If it fails to pass, the extra duties shall be returned to the importer who has paid them. What disposition the importer shall make of them after he gets them is not prescribed. He may keep them in his own pocket, or turn them over to the merchant who bought of him; but it is not probable that the consumer would get back the increased price that he paid.

This act has been criticised by such journals as the *Temps*, but the criticism is not important from the protectionist point of view. The *Temps* urges that whenever an increase of taxes is contemplated by the Government, it implies that this increase has been solicited by interested parties. The members of the Government are therefore in position to take advantage, and to allow interested parties to take advantage, of a decision to raise duties. This decision being immediately operative, those who know of its existence before it is announced to the public may make use of their knowledge by speculating for a rise in prices. The possibility of such demoralizing practices the *Temps* regards as constituting a grave objection to the law. In its judgment the increase of a duty should be the subject of open, careful, and prolonged discussion by the Chambers. The *cadenas* law it declares to be the *coup d'état* applied to customs administration.

The experience through which we have recently passed in this country shows that the *Temps* is misled by what Mr. Bagehot used to call the "literary theory" of government. We have no *cadenas*, but we have seen that the recent changes in our duties have not been arrived at as the result of open discussion in Congress. It would be hardly incorrect to say that they were not discussed at all in the House of Representatives, and the discussion in the Senate is not believed to have really had any influence on the rates as finally determined. In fact, the very contingencies regarded as deplorable by the *Temps* are thought to have been realized here. Members of the Legislature have been solicited by interested parties to establish certain increased duties, and the decision to adopt these duties has been reached secretly, so far as the public and even the greater part of the members of Congress are concerned. The evils of which the *Temps* complains are evidently not peculiar to such acts as the *cadenas*.

The proper contrast to be drawn is between the French plan and that suggested by Mr. Dingley of making the tariff retroactive. Under the French system a tariff goes into effect as soon as it is brought forward by the Government, and if the Government does not pass its bill the duties collected under it are refunded. There would be no "anticipatory importations" except by those importers who felt sure that a tariff was to be passed, and who knew what it was to be. Under the rejected Dingley plan, the importers would get their goods through the custom-house and sell them before the tariff was enacted, and then the Government would collect its duties as best it could. From a protectionist point of view there seems little question as to which plan is the most desirable. Let the "parties interested" agree with the leaders in Congress upon a satisfactory tariff, and then let the Treasury collect these rates from the very day the tariff is introduced. By this plan the Government would get more revenue, while the "parties interested," it is safe to say, would look out for themselves.

Considered as a means of retaliation, the *cadenas* law also compares favorably with the Dingley act. Under that act the President of the United States may enter into negotiations with countries exporting argols, wines, and spirits for "equivalent concessions" in the matter of duties, the concessions on our part being rather strictly limited. So the President is empowered to "secure reciprocal trade," by taking tea, coffee, and tonka beans off the free list when imported from countries that show a reluctance to reciprocate. But the powers of the French Government to raise duties are quite unrestricted, and under the new law they can be very promptly exercised. So far as immediate results are concerned, it is intimated that Mr. McKinley may be able to make some concessions to France which will relieve that country from the necessity of applying the *cadenas* law against us.

THE ASSASSINATION OF CÁNOVAS.

The first question which everybody is asking, in connection with the shocking news of the assassination of the Spanish Prime Minister, is, What will be the effect on the political situation in Spain? What, above all, will be the effect on Spanish international relations—on the Cuban rebellion, on the Philippine revolt? Those who know most about Spanish politics are most reserved in making predictions of any kind; but they are all agreed that the consequences of Cánovas's dastardly taking-off are certain to be grave, and may easily amount to a national disaster.

To begin with, Cánovas was the only man who could hold the Spanish Conservative party together. Even he could not do it perfectly. For some time there have been mutterings against his leadership, and Francisco Silvela, at the head of a small Conservative following, has been in open revolt. No one is in sight able to unite in his person the qualities which gave Cánovas his prestige. He had, in the first place, a peculiar claim to the confidence of the royal family, the restoration of the Bourbons in 1874 having been mainly his work. Thus he stood in an unusual way for the idea of stable government, which has come in Spain, on the confession of even Castelar, to be connected with the monarchy. In addition, Cánovas was a man of distinguished ability and high personal gifts. As an historian he had a deserved repute. As a philosophical writer on politics, and as a friend and patron of letters, he was a prominent figure in the literary life of contemporary Spain. His oratory was trenchant and precise beyond the use and wont of Spanish statesmen, who, for the most part, delight to disport themselves on the windy plains of Troy. Cánovas had thus an extraordinary personal and political authority, to which, as we say, no other Conservative public man—and no Liberal leader, not even Sagasta—can pretend.

Whether he was not, for his fame, happy in the opportunity of his death may be a subject hereafter debated. The gravity, the well-nigh desperation, of Spanish affairs, have been masked from the world by the indomitable energy and high spirit with which Cánovas has faced his thickening difficulties. His task has been one to daunt any heart but the stoutest. The drain and depression of fruitless war in Cuba and the Philippines have been added to discontent at home, to anarchist outrages and conspiracies, and, latterly, to the threat of another Carlist rising. The financial situation of the country has become critical in the extreme. If the statement of the British Foreign Office just given out is correct—and it cannot be very wide of the truth—the interest on the Spanish national debt now swallows up considerably more than half the national revenue. It seemed impossible, we say, for any man to stand up against such a beating storm of public peril, and Cánovas's assassination may have saved his name from being associated hereafter with a great national catastrophe instead of simply with a horrible crime.

Whatever political readjustment may follow in the Spanish government, it seems certain that the prosecution of the colonial wars will be greatly relaxed. Sagasta has openly opposed the policy of blood and iron in Cuba. So has Silvela; so did, the other day, Señor Moret. Even under Cánovas there had been an abatement of the fierce energy with which the suppression of the Cuban rebellion was at first undertaken. A different, a milder policy may be looked for; negotiations for Cuban independence may possibly be admitted after a time. If there were any way of retir-

ing without apparent disgrace, there can be little doubt that Spanish statesmen would eagerly adopt it. But all such speculations are of small account. When we see all calculations upset by such a bolt from the blue as the assassination of Cánovas, we are led to put less faith than ever in political prophecy.

But there is one aspect of the matter about which there can be no doubt. The mania for murdering public men is on the increase. Assassination as a political remedy is coming to be a favorite resort of desperate revolutionists or unbalanced minds. Cánovas was shot down not because he was Cánovas, but because he was Prime Minister of Spain. And there seems to be no efficient way of protecting public men against such dangers. The shrewdest detectives are at last eluded, the most vigilant police evaded. Precautions should, of course, be redoubled, but they will not insure the personal safety of conspicuous statesmen, who cannot all of them lead the life of the Czar of Russia. Public office of the higher grades will for some time at least have to be classed among the extra-hazardous callings.

But if political assassinations cannot be prevented, they can be shown to be futile and so effectively discredited and discouraged. They can be met with serenity, such as the President of the French Chamber displayed when the Anarchist bomb was flung from the gallery. The lurking reptiles can be shown that their fangs may strike but cannot frighten; that they may threaten but cannot disorganize society. Those responsible for the administration of law must make it clear that they are not to be swerved one inch from their course by panic fear. The situation undoubtedly calls for a new and high form of civic courage. Kings and presidents and prime ministers will have to cultivate the jaunty coolness shown by King Humbert, who simply shrugged his shoulders at the recent attempt to assassinate him, remarking that it was merely "one of the incidents of his profession." With civilization nerving itself against such shocks and determining to go on its way regardless of them; with men in conspicuous stations taking calm account of the new risk, the new-style political agitators by means of bomb and knife will at last get tired of going to death for nothing, and of dashing themselves in vain against a society immovably based on law and order.

THE INTERVIEW AS LITERATURE.

In the preface to his latest volume of 'Portraits Intimes,' which consist, as is well known, of "walks" and "evenings" and "dinners" with various celebrities, M. Adolphe Brisson makes a plea for the interview as a legitimate literary form. He admits its novelty. He is dimly aware of its American origin—though his historical account of its beginnings in the attempt of "M. Joseph Cullagh," "a convinced deist," to cover "M. Robert Ingersall" with confusion, has a strangely foreign air. But new and crude though the interview be, out of the Nazareth of American newspaperdom though it come, M. Brisson yet maintains that it deserves, or may deserve when perfected, to rank as a "genre littéraire." At any rate, as he says, in spite of all objections and opposition, the interview goes on its way; it has entered into our manners; it cannot be ignored; besides its practical utility, it has some striking qualities, even merits, from the point of view of literature.

In his analysis of the interview and the interviewer, M. Brisson has many things to say that show how the French practice is assimilated to the American; some that indicate how much the French have yet to learn from us in this art. Everybody will recognize, for example, the kind of interview which he describes as a "duel" between a reporter and a man unwilling to be interviewed. In this species, the adversaries take each other's measure, make feints with their swords (or pencils), and try to deceive each other. But this simply puts the interviewer on his mettle; if his victim will not speak, it merely imposes the duty to gather the truth from his gesture and expression, to guess at what is left unsaid, to surprise the secret thought. M. Brisson only hints at this in passing, and gives no examples. They could be supplied in abundance by any American. Senator Wolcott will say nothing, but his "smile" is a sufficient proof to the astute correspondent that England is about to abandon the gold standard. Platt refuses to be interviewed, but he looked greatly "depressed" as he came away from the Mayor's room, Governor's chamber, or White House, as the case may be, and the inference is plain that his man is not going to get it. These are but samples of the skill of the American interviewer in breaking down the fence of his adversary in the interview which is a duel. They do not do these things better in France.

The willing interview is pictured to the life by our Frenchman. We cannot do better than quote his account of it—particularly as it relates to an interview with a literary man. The literary interview has been having a great run in America, and some very pretty things have been done in that line. The method is accurately described by M. Brisson:

> "I remember a call I had to make upon one of our most charming writers. He had given me an appointment in the morning. When I arrived everything was ready. . . . He had taken the pains to write out for me a sketch of his life; he had added to it a list of his principal works, and of criticisms of them, generally favorable, taken from the leading reviews. Several flattering letters from Lamartine and Victor Hugo, some photographs, two or three unpublished pages, were included in the bundle which he forced upon me. And when I entered, as when I came away, he delivered himself of some exquisite phrases, which he took care to utter slowly, so as the better to engrave them on my memory, etc."

The prepared interview M. Brisson seems not to know. Chauncey M. Depew ought to explain it to him on his next trip abroad. It consists, as every cultivated American knows, in typewritten question and answer, all worked out by the person interviewed, and passed out entire to the lucky interviewer. It is a pity that M. Brisson is not acquainted with this form of the interview, as it would immensely strengthen his argument that it deserves a place in literature. In few other writings is there discernible so fine a play of the imagination. The information, the shrewdness, the intimate acquaintance with European politics attributed to the interviewer, in questions he did not ask, but which were printed as if he did, have often brought a smile to the face of the most melancholy reporter. There is deep literary art in this. So there is in the phrases scattered up and down the prepared interview—"Mr. Depew was reluctant to answer this question"; "Mr. Depew hesitated before replying"; "Mr. Depew reflected several minutes before saying," etc. When we know that all these realistic touches were dictated to Mr. Depew's stenographer, and clicked off on Mr. Depew's typewriter, our respect for the prepared interview, as a literary production, cannot but be greatly heightened.

Where our French authority will seem to experienced Americans weakest is in his account of the qualities which go to make up the successful interviewer. He intimates that a good fund of general knowledge is well-nigh indispensable. He even maintains that the interviewer must have "a certain delicacy which will suggest to him how far he may fairly go in his revelations, and what limits are imposed upon him by discretion." It is sufficient to say that either of these rules would put an end to nine-tenths of the interviewing in American newspapers; therefore, they cannot be necessary. M. Brisson is of the opinion that the interviewer is born, not made; this may be a sly way of allying the interview with poetry; but his contention that no man is fit to interview before he is twenty-five, or after he is fifty, shows a narrow horizon. After this, it is quite needless to follow him into his discussions of the interviewer's careful preparation for his work, his courtesy, his good faith, and other qualities which we know to be wholly unnecessary in practice. All that may do very well for literature; but if you make the interview literary in that sense, you run a great risk of making it altogether cease to be the American interview as we know it.

WITH THE RUSH TO THE KLONDIKE.

STEAMER QUEEN, June 27, 1897.

When the excursion steamer *Queen* left Seattle and Victoria on the twenty-third of this month, besides the usual collection of tourists who had come to make the Alaska trip, she had on board another crowd of a very different kind. A few days earlier the tale had gone out to the world of the return of miners with great quantities of gold from the Klondike region in the far north of British America, and the news had created widespread excitement. The "rush" began at once, not only because thousands of people wish to be among the first to arrive in the new Eldorado, but also because they well know that the time before the beginning of the next Arctic winter is short enough in which to traverse the immense distance that separates them from their promised land. Naturally they turned first to the usual means of transportation that would bring them nearest to their goal. With the whole Pacific Coast, not to speak of other places, thrilling with the excitement, and with wiseacres talking of discoveries to surpass those of 1849, the number of applicants for passages far exceeded the regular supply, so that many extra boats have been hired, there being at least five of them due within a week after ours.

The easiest, if the longest, way of getting to the Klondike is by ocean steamer to St. Michael's Island in Bering Sea, and thence, in a smaller boat, up the Yukon River. Many have already gone in this manner, yet it has serious drawbacks. Although we are still in June, the Yukon, which at present is too low for good navigation, freezes so early that it is by no means sure that those who start now can reach their remote destination without being caught in the ice and forced to winter on the boat. Then, too, the transportation companies do not allow miners to bring up their food with them, thereby forcing them to buy at the companies' stores at any price. The other, much shorter, routes are from points on the coast of southeast Alaska to the lakes and rivers that flow into the upper waters of the Yukon. Of these routes the best known is via Dyea, a trading-post boasting of a grocery-store and a post-office, a thousand and twenty-five miles by sea from Victoria, at the head of an inlet called the Lynn Canal. The trail from Dyea to the nearest lake is only twenty-seven miles, but part of it is over a mountain, and is so difficult that it is impassable even to pack-horses. When we remember, accordingly, that, besides his "kit," each man should carry provisions to last him for the greater part of a year, we can see that even this short distance is no trifling obstacle. Nor is the long journey, in small boats made on the spot, a thing to be lightly undertaken.

Of course, every place on the *Queen* was filled; the tourists, much the ordinary assemblage, looking with interest and wonder, a certain admiration and some pity, on their two hundred or so unexpected companions. These were mostly Americans, with a number of Canadians and Englishmen, as well as a few of other nationalities. There were, indeed, many sorts and conditions of men: veteran miners, who had prospected and mined for years in more than one State of the Union, and pale shop clerks, vainly trying, with the aid of flannel shirts, broad-brimmed felt hats, and pipes, not to have the stamp of the "tenderfoot." There were lawyers and doctors, a candidate on the Populist ticket at Tacoma last autumn, two Yale graduates, a prize-fighter known as "The Montana Kid," an ex-judge, and an ex-Governor of a Territory. There were men with gray beards, mere boys, and even a few women, not mostly of the best kind; there were many with attractive if rough faces, and here and there one who looked as if he had seen the inside of a jail; but all were now full of the same thought, the same desire to rush to the gold fields, the same dreams of fabulous wealth. Each one had, on an average, nearly a ton of baggage, with whatever money he could scrape up, as he knew that he was bound for a country that produces nothing but gold, and where all the necessaries of life may be expected to be at famine prices. Each needed, besides his camping outfit, mining tools, tools for cutting wood and for other purposes, clothing to stand a winter where the thermometer goes down to seventy degrees below zero, a gun and ammunition to shoot game, and food for about a year, if he were prudent, as those who leave now may, in case of accident, be frozen up for many months before reaching inhabited territory. If a man's provisions give out, what can save him, if anything, but the charity of others? And Heaven help him in a region where every one has to guard against the danger of starvation.

Some, of course, were much more fully provided than the rest, thanks to greater wisdom and experience or to longer purses. Some, undoubtedly, are running terrible risks, even if they are modest in their desires, and merely intend to hire themselves out as day laborers, at any rate at first, and thus will not be absolutely obliged after their arrival to have independent means of support. The most favorably situated are those with experience who have banded together in parties of from two to twenty, under some good leader, and have had the means to supply themselves with whatever is necessary to guard against all contingencies. Even they spoke seriously enough of the business on hand, and of the hardships and disappointments that must await the majority of the seekers.

A question much discussed was the probability of having to pay customs duties. The Klondike River and adjacent streams, where the richest "strikes" have been made, are situated in British territory, though near to the Alaska boundary. Already there are mounted police on the spot to keep order, and the Canadian newspapers, spurred by jealousy at the great impetus the "rush" is giving to the trade of certain American cities, notably Seattle, are clamorous for customs officers to collect duties which should not only benefit the Canadian revenue, but, it is hoped, induce future miners to buy their outfits in Victoria and Vancouver. The Dominion Government probably will act as soon as possible, but it is hard to see where some of the present immigrants are to get the money from if they have to pay much, for they are certainly not all provided with superfluous funds. It is to be feared, too, that these latest gold discoveries may lead to political complications. When more gold is found on the Alaska side of the frontier, as in time there probably will be, and a large mining population, composed chiefly of Americans, is scattered through this distant and difficult region, it is not going to be perfectly easy to police the territory or make boundary lines respected. More serious is the fact that the nearest entrances to this Canadian country are through land now held by the United States, but claimed by Great Britain. The increased importance of just such places as the heads of the Lynn Canal will not facilitate the settlement of the Alaska boundary controversy.

Our journey from Victoria to Dyea passed without any particular incident till at about twelve on the third day we reached our destination—three or four houses at the end of a bay, walled in by lofty mountains with steep, wooded sides and snowy tops. The prospect looked blank enough for those who were to land. It was not so much that the wind was high and the sea rough, as because the water was too shallow to permit the *Queen*, which was here for the first time, to get far up; so the miners, with their almost two hundred tons of goods, would have to be put on shore among the rocks, with no way of getting out of them except by small boats which might take a week before completing the job. This was discouraging as a start; accordingly the captain went off in a steam launch to examine the neighboring harbor of Skagway, five miles distant, where there is a better landing. An hour later he returned with the joyful tidings that from Skagway, where a wharf was almost completed, a new trail to the lakes had been opened within a week through the White pass, which, though five miles longer than the one from Dyea, was a thousand feet lower and could be entirely crossed by horses. What was more, a few horses were there for hire, while others were expected within three or four days. This announcement was received with jubilation, even if there were some grumblers who would have preferred the original route; anchor was weighed, and before long the steamer was at Skagway, where a store has already existed for a fortnight. Although the work of disembarking lasted almost till next morning, the men themselves were soon ashore with part of their goods, and a whole village of tents sprang up under the shelter of the trees. On some were facetious signs such as "The Lobby" and "Paradise Alley"; one, presumably for unfortunates whose tents were not yet landed, or for lazy men, was labelled "Franklin Hotel," and by it all could read "Ham, ten cents." Fires, on which supper was being prepared, blazed everywhere; all was activity and good humor. Behind were comfort and civilization; ahead, thirty-two miles of trail and five hundred and thirty-four in boats constructed by the adventurers themselves, and then the Klondike with all its wondrous chances and terrible uncertainties.

ARCHIBALD CARY COOLIDGE.

THE POLITICAL SITUATION IN ENGLAND.

LONDON, July 31, 1897.

It is very interesting, in revisiting England two years after the subsidence of the Home Rule agitation, to observe the situation made by the great Conservative victory. The very first thing which strikes me is the general political apathy—that is, the languor with which nearly all political questions are discussed. Much of this is undoubtedly due to the absorption of the public mind in the Jubilee, and there are already signs of some change. But, twenty

years ago, the rôle which England is playing in the Mediterranean would have created the fiercest popular excitement. That the great fleet which was reviewed at Spithead the other day, which cost so much, and is the cause of so much pride, should give England so little weight in European councils, that the say of Austria or Italy should count for just as much as her say, in a problem which is mainly maritime, is undoubtedly felt to be a little humiliating. I have met no one who denies this, but I do not meet with much indignation about it. The general comment is, "What could Lord Salisbury do?" and there is a general and almost amusing disposition to throw the blame on the Greeks, who have done simply what Charles Albert did in 1849, and Garibaldi did amid thunders of applause in 1860. I notice, too, a disposition to treat the success of the Turk, in defending himself, as, in some sort, a restoration to the position of respectability as a sovereign power which he lost by his massacres in Armenia and in Crete. There is really an odd contradiction between the way in which the people treat it as a matter of common right and decency that the Greeks should pay his expenses for slaughtering them, and the way in which they repel with horror the idea of letting any Christian population pass under his rule as a consequence of his victory; that is, he has a right to kill and burn, but not to annex.

Then there is a widespread dissatisfaction with the way the Ministry is represented in foreign affairs in the House of Commons by Mr. Curzon. Nobody can recall a period when the Government spoke in the House for the Cabinet on international concerns through a man as young and as unimportant politically as Mr. Curzon. I do not mean to depreciate him in saying this, but he has produced no impression in public life to make him seem a fit successor for Canning or Palmerston or Gladstone. And then, he has that priggish air which young men who have travelled and observed much find it so difficult to avoid. Moreover, he has no backers on his side of the House. Mr. Balfour and Sir M. Hicks-Beach know much less, and care less, about foreign politics than he does, so that the task of explaining things and putting a good face on Lord Salisbury's Eastern policy is exceedingly hard and is performed with the prevailing languor and doubt. No one would imagine, to listen either to Mr. Curzon or to his chief, that England was a first-class Power and had the command of the seas.

With Lord Salisbury there is general disappointment, which even his warmest admirers find it difficult to conceal. His love of biting epigram and "blazing indiscretion" in speech, and the way he spoke of the old Turk a year ago at Guildhall, led people to expect some vigorous action in the Mediterranean, where he would have the Turk in his power. In Armenia he could do nothing, but Crete would be as completely under his guns as the Isle of Wight. His apologies for doing nothing and for being led by the three Emperors, and calling rather weakly for another Bismarck to get him out of his trouble, as he did recently in the House of Lords, even his own supporters find mortifying. That he was not a man of vigorous action has been well known ever since the Berlin Conference, but it was somehow forgotten during the Home Rule agitation. In fact, the way the dread of Home Rule led Englishmen to exalt everybody who opposed it, is a feature in the situation which is almost diverting. Nothing of late years appears to have done as much for the reputation, moral as well as political, of politicians, as to have been Unionists and to have assisted in Gladstone's overthrow. Mr. Chamberlain, for instance, has risen into the ranks of an austere moralist, even with so stern a critic as the *Spectator*, through opposing Home Rule, and yet he makes, in his works and ways, the nearest approach to the typical American politician as yet seen in English public life. For Lord Salisbury, however, there is the excuse of many months of great domestic anxiety, for Lady Salisbury has long been in a very precarious condition of health.

The size of the Tory majority, too, has much to do with producing the prevailing languor. It is so large that every one feels that nothing can happen to endanger the tenure of the Ministry. No "scare" or dissension is in the least likely to harm them. This has its effect on both sides. The Liberals feel that there is no use in agitating while the elections are at least three years away, and the Tories are quite satisfied with the situation as it is. Moreover, if the Tories were to go out to-morrow there would be the utmost uncertainty among the Liberals as to their leadership. Sir William Harcourt is very able, and has rendered great services to the party, but he is old and his health is somewhat impaired. It is doubtful whether Lord Rosebery could be induced to take his former place, even if his temperament fitted him for it, which it certainly does not. He is not serious enough for the Liberals, and then, too, he sits in the House of Lords, and the inconvenience of leadership by anybody outside the Commons is fully acknowledged. Mr. John Morley is too earnest and literary, and Mr. Asquith has hardly grown up to the place politically. So that even if it were possible to turn the Tories out to-morrow, I think the Liberals would shrink from the succession. The party, too, is a good deal rent by the "labor problem." The talk of the extreme Radicals frightens the middle classes, and in England the middle classes are always a powerful body.

No discussion of the causes of the prevailing apathy would, however, be complete without touching on two powerful aids to political indifference—sport and society. The absorption of the public mind in bicycling, football, horse-racing, boat-racing, yachting, grouse-shooting, and deer-stalking, is something of which you can have little idea, great as is the amount of attention bestowed on these things in America. It is to these mainly that people give serious and continued attention, not to the Turk or the Emperor. It is about them and not about politics one hears talk in the trains and in the parks and the taverns. Going into a barber's the other day, the operator, although I am plainly past the sporting age, asked me eagerly whether I "had any cricket news," that being, as I afterwards learned, the day of the Eton and Harrow match. I said no, I had just come to town. "But I thought you might have heard it at your club, sir," he said. Grace, the cricketer, is, in the upper circles, a greater man than Gladstone. The way the bicycle has opened the country roads to the masses, and to the women, too, in fact, has exalted muscle and staying power and speed to extraordinary eminence as objects of human interest and desire. That sport has not swept the colleges with a violence like the football cyclone in America two years ago, must be ascribed, I think, to the greater phlegm of the English temperament, and the confinement of games to simple amusement, instead of making them paying exhibitions.

The national devotion to pastime is, of course, a great help to a ministry which has a troublesome foreign policy on hand, as it is a great hindrance, especially in foreign affairs, to any kind of agitation. But, useful as it may be in this way, it cannot compare to the social influence. I do not think any contrivance in English history for the support of a party can equal what is known here as "The Primrose League." The idea on which it is based—the enormous power in English life of what is called "good society"—is said to have originated with Disraeli. No man felt the seductions of "high life" more keenly than he. He saw that the desire "to rise in the world"—that is, to get into a higher social circle than the one you live in, and, even before getting into it, to be recognized and have any kind of intercourse with those who are in it already, or, to use the popular slang, "to take tea with the Duchesses"—was the darling passion of a vast number of Englishmen and Englishwomen of the middle class. It is said to have first occurred to him that this could be readily used for political purposes, or, in other words, that it might be made to seem "caddish" to be a Liberal. So the "Primrose League" was really founded on his grave. That is, a mistake about the Queen's meaning, when she laid primroses on his tomb, and said, "They were his favorite flower" (Prince Albert's), associated the flower in the popular mind with Disraeli, to such a degree that, on his birthday, the shrewd, cynical Hebrew countenance of his statue in Westminster is comically covered with wreaths of it. When, during the Home Rule agitation, it was determined to bring this new force into play in politics, it was called the "Primrose League," and local "Habitations," or clubs, were established all over the country, to which any one might belong who was opposed to Home Rule and admired Lord Salisbury and Mr. Balfour, and in which he could, on stated occasions, take tea with the women of the county gentry, and join Duchesses and Countesses in denouncing the "Rads."

The plan has been a great success, and is probably the most potent influence behind the Tories to-day. It has put a kind of social stigma on Liberal politics. With a certain set, all Gladstonians are "caddish," or "rotten," and pains are taken to deny them social recognition. A large number of the Liberal women feel this, and regret that Tom or Charley cannot be a Conservative, as his politics cuts them off from invitations to the smartest balls and dinners. I have heard of a case where a lady who is in the habit of seeing Liberal politicians of the more radical kind, finds that her sons, who belong to the sporting world, carefully avoid meeting them, and call them "Mother's cads."

It is perhaps going too far to say that Disraeli originated the plan of making Society tell on politics. Ever since the passage of the Reform bill, a man's politics has made a difference to him socially in England to a degree unknown in America, except during the civil war. I remember that, during that

period over here, the aristocratic set "cut" and looked down on friends of the North, just as more recently they "cut" and looked down on the friends of Home Rule; but the idea of organizing social influence so as to make of it a political power, is of recent date. The middle class is making money rapidly; titles are becoming more and more within their reach. Aristocratic exclusiveness has gone down completely before the fall of rents, and every man with money and Conservative views finds association with peers and peeresses very easy. For a middle-class Englishman, especially the young generation, few things are more intoxicating than such associations. It means invitations to country houses, "a few days' shooting" on the moors, excellent fare, and good wine; and the fever goes down till it gets almost to the laborer. It is hardly necessary to say that when a party is largely dominated by such an influence, sympathetic or imaginative politics are not in favor with it, so that the Turk chose an excellent time to do some massacring, and the Greeks a very bad time to rise, when the Conservatives were in power.

Nevertheless, the Tories are making some efforts to redeem their ante-election pledges, and to make out that they are really the true friends of the workingman. They have got through the Commons a workmen's compensation bill, under Mr. Chamberlain's direction, which is shocking employers by its liberality towards persons injured in factories and machine-shops, and the fate of which in the House of Lords is still problematical, and they have, through the Jubilee, made prodigious efforts to draw the colonies to England, with, I think, great success. All these things help to keep down the indignation which the foreign policy, and the queer failure to bring to light Mr. Chamberlain's connection with the Jameson raid, are well calculated to excite. But, after all is said that can be said of mistakes, blunders, and weaknesses, the fact remains that England is an enormous, unprecedented political success. The Government is admirably administered in every department. The best men the country can produce, whatever their faults or shortcomings, are engaged in the work of legislation. Legislation is well considered and much debated. The Boss has not yet begun to show himself. Fitness, and not "representation," is still universally recognized as the one title to office. I was glad to see that in your article on the Jubilee you called attention to these things as the true sources of English prosperity. Neglect of these things, the treatment of offices as "plums," and "representation" or "recognition" of classes and interests as the true rule of distribution, and the employment of second and third-rate men and jobbers and speculators in our legislation, are what keeps us behind England in the race.

The Foster despatch about the Treaty, which it is now said President McKinley and Mr. Sherman never saw, has, of course, excited a good deal of disgusted attention, and naturally much afflicts decent civilized Americans here. They were astonished by its emanation from the pen of Mr. Foster, who has been so long familiar with diplomatic usages. The English ascribe it, some to well-known American coarseness and bad manners, others to the desire of the Republican politicians to get up a foreign quarrel to turn popular attention away from their tariff tricks and from the currency problem. I cannot myself help explaining it, in some degree at least, by the success of Cleveland's outburst in the Venezuela affair. When I say success, I mean that it apparently produced the desired effect on the English. That is, if a friend owed you some money, and you went to his house without warning and threatened to punch his head if he did not pay you by to-morrow morning, you could well say, as so many said in America after the Cleveland message, that this was the way to make the fellow pay, for pay he certainly would if he had the money. It was a sort of proceeding which of course delighted the bar-rooms and the race-tracks. But I am bound to say I think that a very large part of Cleveland's triumph, and the resulting effect on the tone of American diplomacy, was due to Lord Salisbury's bad management. He wasted his breath arguing with Mr. Olney against "the Monroe Doctrine," as if there were any use in arguing against a "doctrine." Diplomacy has nothing to do with "doctrines," but with the application of them. Half the space would have sufficed, not for showing that the Monroe Doctrine had no force, but that the American claim of protectorate over Venezuela had not appeared in the previous correspondence, and had, in fact, been disclaimed in it, and that its sudden production in the guise of a threat was unaccountable and unmannerly. Far from this, he swallowed the threat, and meekly accepted the commission which was to draw his frontier for him, and which turned out to be perfectly useless, except for the purpose of collecting maps. It is not wonderful that, after this episode, American politicians should conclude that they might talk to him in any way they pleased, and might use any international controversy with him as a means of stirring up Jingoism.

All this was brought home to me forcibly by an article in the June number, I think, of the *Atlantic Monthly*, showing that all persons who condemned the Venezuela message—and the writer mentioned seriatim the journals which did so—were "un-American" and afflicted with over-refinement and remoteness from "nature." If this had any meaning, it meant that the forms of social intercourse, the moderation in language, and the air of respect for others, which mark the relations of civilized men in our day, indicate a falling-off on our part from the demeanor of Apaches and Comanches, to say nothing of the Australian "black fellows." An Australian savage gets his bride by hitting her on the head in the night around the fire, and then dragging her by the heels, insensible, into the bush. This is much nearer to "nature" than the methods of the civilized wooer, with his bouquets of flowers and his presents and his wedding ring, but is it better? Civilization means the imposition of a thousand restraints on "nature," and above all in social intercourse; and the methods of diplomacy are based on those of social intercourse between educated gentlemen. One of the cardinal rules of such intercourse is that, when trying to settle anything by discussion, you must not call your adversary names, or charge him with dishonesty, or, in fact, do anything needlessly to provoke him. It is unfortunate and a bad sign of the times that the more ruffianly style of debate with foreigners finds increased favor among us, when the foreigner happens to succumb to it for the sake of a quiet life. But politeness is something the civilized man owes to himself still more than to others; we should always behave civilly for our own sake as well as for that of our neighbors. It is, too, almost impossible to avoid the inference that the hatred and contempt for foreign nations which have become part and parcel of the support given to the tariff during the last twenty years, have had also a very bad effect on our diplomacy, and have done much to change foreign opinion of the American character. Many people here have the idea that we are using our remoteness and our strength to set up a barbarous nation of the fifteenth or sixteenth century, despising literature and art, loving battle, murder, and savage rudeness of speech.

E. L. G.

MUNICH IN SUMMER.

MUNICH, July, 1897.

A little volume for the pocket recently published by Dr. Gsell Fels, the well-known author of guide-books, gives the outlines of one hundred excursions from Munich, and thus bears testimony to the exceptional situation of the Bavarian capital as the centre of a multitude of enticing spots distributed in its vicinity like the knots in a spider's web. The high altitude of the city, its cleanliness, the purity of the drinking-water, obtained far away in the mountains, and the excellent sanitary conditions in general, make modern Munich one of the most salubrious cities in the world. The canalization and flooding system, since its extension in 1896 over fifty-nine additional streets and squares, reaches a present total length of 178 kilometres. The swift-flowing Isar, when at low-water mark, carries off the contents of the sewers twenty times diluted, while, according to Von Pettenkofer, the proportion of one to fifteen would be very favorable. The mortality among the population has been reduced by nearly one-half within twenty-six years, and, to judge by the looks of the common people, it cannot possibly be high. It would be folly to question the dictum of the medical profession as to the deleterious effects of beer-drinking, or to suppose that the enormous consumption of the brown fluid is productive of a high state of intellectuality; but there is a strong temptation, as one observes the people in Bavaria, to take an optimistic view of the beer question. The people, men, women, and children, soldiers as well as civilians, look hale and hearty; they have that good-nature and kindliness which, with simple people, are sure signs of physical well-being. Well-fed men and women are a common sight, but cases of inordinate corpulence are much rarer than one would expect. A certain politeness is peculiar to the people of all classes in Munich. They not only have a *Grüss Gott*, or *Wohl bekomm's*, or *Wünsche wohl zu speisen*, for every one as the occasion may suggest, but they are ready to render to the stranger those little services he is so often in need of, and to acknowledge by a *Danke bestens* the smallest fee one may happen to give. They are not quarrelsome, nor do they get excited on slight provocation. When the tramway is obstructed—which seems to happen rather frequently—the conductor good-naturedly helps to remove the obstacle without indulging in loud and undignified demonstrations of ill-humor; those scenes of vociferating officials surrounded by boisterous crowds, which attend similar mishaps

in Paris, are not to be witnessed here. On the other hand, it must be confessed that the horses on the tramway line travel at a very deliberate pace; electric cars are running on some lines and are being rapidly introduced on others.

On Sundays the churches of the city are filled with men and women. At the same time the villages and *Sommerfrischen* in the surroundings attract multitudes of artisans and tradesmen, with their families, every Sunday when the weather is fair; according to the daily papers, over 70,000 tickets were sold on a recent Sunday at the railway stations. Disorder at the popular resorts is said to be rare; at those of the better class, such as the Kaimsaal, the conduct of the crowds is certainly irreproachable. In this large, well-constructed, and well-ventilated music-hall the audience is seated at round tables, eating, drinking, and smoking, while listening to a "popular" concert whose programme is largely made up of compositions of Handel, Haydn, Beethoven, Mendelssohn, Wagner, etc., etc.—a most characteristic combination of the material with the ideal, the one so little encroaching upon the other that not once during the softer strains of the orchestra is the most complete stillness in the audience disturbed by an ill-timed movement of one of the hundreds of knives, forks, and glasses held in suspense, or an awkward step of one of the waiters, gliding on tiptoe through the rows of tables.

It is stated on good authority that more than 4,000 painters have their studios at Munich, and as most of the productions of the resident artists are at least temporarily exhibited here, it is evident that the amount of painted canvas continually to be seen must be enormous. Aside from the five permanent institutions (the Old and New Pinakothek, the Kunstausstellung, the Von Schack Gallerie, and the exposition of the Kunstverein), the annual "International Exposition" in the Glasspalast forms a great centre of attraction during the summer months. This year's collection, the seventh, has been arranged by Von Lenbach and Prof. Seidl, the architect, with wonderful taste and artistic skill. The distribution of light is all that could be desired, the space allowed each picture abundant, and by a generous supply of divans, as well as the use of great quantities of Gobelins and Oriental drapery in vestibule and ante-rooms, grateful resting-places are prepared for tired limbs and eyes. A good restaurant in the building enables the visitor to prolong his stay beyond his usual meal hours, and thus to get the full value of the admission price.

The representation of the various countries (including America) is respectable in all cases, and in several excellent. As might be expected, the Munich groups, viz., the Künstlergenossenschaft, the Secession, and the Luitpold Gruppe, contribute the largest number of pictures. Von Lenbach has his own room, with some fifteen or twenty pieces, among which the study for a portrait of Theodor Mommsen calls for special mention. Böcklin, Uhde, Firle, Stuck, Defregger, and many other eminent masters exhibit two or more canvases each. It is not difficult, even for a layman, to see that the modern element is gaining ground among Munich artists; while predominating in the division of the Secessionists, it is not absent in the other sections. The peaceable competition of the various groups will doubtless, in the end, be productive of greater good than the bitter antagonism of years gone by; a general levelling and blending of discordant artistic principles is neither to be expected nor to be desired.

A. L.

Correspondence.

GREECE AND RUMANIA.

To the Editor of The Nation:

Sir: Your editorial note in No. 1673 on Mr. Dillon's article concludes with the significant sentence, "If they [the Greeks] will learn to govern themselves," etc. What reason have the friends of Greece to hope that such a time will ever come? The Greeks have from time immemorial shown themselves more nearly devoid of political sense than any other civilized nation on the face of the earth. They have never acted together even in the direst emergency, except when tricked into doing so, as at Salamis, or when compelled to do so, as they were (at least in a sense) by Alexander. They were never united against the Persians, the Romans, or the Turks. If ever there was a time when concert of action was all-important, it was during the terrible years that preceded the battle of Navarino. But no leader appeared who was able to secure this concert, and, but for the opportune intervention of the three Powers, the cause of Greece would have been lost, in spite of sacrifices and bloodshed almost without a parallel in modern times. Ever since the dawn of authentic history the Greek had been the same valiant individual warrior, the same bigoted partisan, the same independent thinker, and the same failure as a member of the body politic; though his recent exploits on the Thessalian border make it necessary to revise our judgment on the first point.

And most painful of all, just as, in the days of old, the Persian and the Roman always had numerous partisans on the other side of the Ægean and the Adriatic, so in more recent times the Turk has rarely been without his supporters and champions in the same region. When Fallmerayer first launched his now exploded hypothesis on the origin of the modern Greeks, a veritable chorus of indignation went up all over Europe, but loudest from the Greeks themselves at what they chose to regard as a desecration of their national character. Since then it has been abundantly demonstrated that an infiltration of Slavic blood might have given them some of the docility, the dogged persistence, and obedience to authority which they so sadly lack, and which probably would have saved them from many of their national misfortunes. It is painful to reflect that the people who have taught the world far more than any other, perhaps more than all others combined, should themselves have learned less than any other. It begins to be only too plain that the harsh judgment of Finlay is, after all, not far astray. Everywhere in Greece one sees that almost the entire male population is still seriously smitten with the mania so much ridiculed by Aristophanes, a passionate fondness for politics. No government can long exist where almost the whole male population is either holding an office or waiting for one—all consumers and no producers. It is not easy to say what is to be done with a people that cannot govern themselves and yet will not submit to be governed by others.

It is interesting in this connection to cast a glance at the recent progress of Rumania as set forth in a volume by Consul-General Benger, entitled 'Rumänien: Ein Land der Zukunft, 1866-96.' The showing made by this book is most creditable to both Government and the people. The population is increasing rapidly, chiefly by immigration. Within the last forty years more than half the soil has been taken under cultivation, the number of hectares having been considerably more than doubled, while in the adjacent Servia the uncultivated soil constitutes nearly six-sevenths of the entire area. Its productiveness per hectare has likewise been correspondingly increased, and the increase in both respects is going steadily forward. Six years ago there were in use in the kingdom 11 steam ploughs, 2,283 threshing machines, 1,474 reapers, and 1,183 mowing machines. Benger calls attention to the fact that while the exportation of wheat from Rumania had increased relatively between 1886-7 and 1892-3 from 514 to 730, that from North America had risen only from 4,074 to 5,086, and he believes that the day is not very far distant when his country will be able to compete on equal terms with North America in the wheat markets of the world.

The first railroad was opened in 1869, and was but 70 kilometres in length. Since then the increase has been more than forty-fold, and there has been a corresponding improvement in highways. Telegraph lines are also being rapidly extended. In 1863 Rumania had but 38 post-offices, now it has nearly ten times as many. The Government receipts for 1883-4 were, in round numbers, 123,000,000 francs; in 1893-4, 189,000,000. The rate of taxation per caput is about 28 francs, to which is to be added 2 francs for local purposes. During the last fifteen years the Government has expended nearly 1,000,000,000 francs for railroads, bridges, docks, highways, military equipments, etc. The public debt amounts to 1,180,000,000 francs, of which sum 200,000,000 is held at home, 220,000,000 in France, and the balance in Germany. Much has been done to promote the general intelligence of the people. The schools are free and attendance obligatory. The two universities, Bucharest and Yassy, founded only a third of a century ago, had last year nearly 1,700 students. In recent years the Government has expended annually on its schools over 20,000,000 francs, as against about one-third of this sum twenty years ago. In 1885 the attendance at the village schools was, in the whole kingdom, but 107,000; at present it is more than 220,000.

The handsome volume of Benger, based, as it is, almost entirely on official statistics, makes a very creditable showing for the Rumanians.

Athens, O., August, 1897.

THE CHOICE OF PROFESSORS.

To the Editor of The Nation:

Sir: The communication in your issue of July 29, signed "Prexie," doubtless won the sympathetic approval of many readers. In his quest for a professor of the classics "Prexie" appears to have corresponded chiefly with young men who had recently completed the course of professional study. It might be enough to say that these young men, following the guidance of their in-

structors, had been so engrossed with technical studies that time had been lacking for the production of papers purely literary. Apparently it is not easy in this country, or in Germany, to win the respect of scholars by work that is purely or chiefly literary.

One who has a wide acquaintance among college instructors learns many curious facts regarding the appointment of college professors—and, it may be added, of college presidents. I am tempted to cite one instance that came under my personal observation. A candidate for a professorship in one of our colleges sent to the president a copy of the thesis—a discussion of a literary topic—which he had presented for the doctor's degree. He was appointed to the position, and afterward chanced to see in the office of the president his thesis, *uncut*. The appointment had been made chiefly upon the written recommendations of two older professors, whose judgment the president felt it safer to trust than his own; and he acted wisely in not attempting to pass upon the thesis.

This incident suggests another phase of the problem propounded by "Prexie." Let us grant his ability to appraise written work presented by candidates for a professorship in the classics. Is he equally ready to appraise the work of specialists in modern languages, in history, in philosophy, in mathematics, in the sciences? As a matter of fact, the most trustworthy means of judgment is the testimony of reputable professors who have actual knowledge of candidates and their work; upon such evidence "Prexie" eventually found it wisest to rely. It is not true that professors in our leading universities will recommend men whom they regard as unworthy or incapable; they are guarded in their language, and their strong recommendations are reserved for strong men.

"Prexie" names two of the younger Humanists (one of them better known as a student of linguistic phenomena) who are known to him as contributors to periodical literature. He cannot have scanned with sufficient closeness the mass of this literature. Certainly he should not have overlooked two admirable articles by a young writer—articles that appeared within a few months in the *Atlantic Monthly*—one, on "The Rational Study of the Classics"; the other, on "Brunetière as a Critic."

From what I have written it may not appear how largely I am in agreement with the views expressed in the communication upon which I have ventured to comment.

PROFESSOR.

Notes.

Harper & Bros. have in press 'School-boy Life in England,' by John Corbin.

A genealogy of the 'Old Families of Salisbury and Amesbury, Mass., with some Related Families of Newbury, Haverhill, Ipswich, and Hampton,' down to about 1700, has been prepared by David W. Hoyt, Providence, who invites subscriptions at one dollar per part, the size depending on the support thus accorded.

The life of Thomas Chandler Haliburton, better known as "Sam Slick," which will be issued almost immediately by the Haliburton Club of Windsor, Nova Scotia, will be the joint production of Professors Wrong and De Mille; of Robert Grant Haliburton, elder surviving son of "Sam Slick"; of F. Blake Crofton, Librarian to the Legislature of Nova Scotia; and of Mr. Anderson of the British Museum. The last-named will contribute the Bibliography of the "Old Judge" to the "Centennial Chaplet."

Capt. Wagner has not allowed his transfer to the Adjutant-General's department to stop his "International Military Series," of which he began the editing while instructor at the Fort Leavenworth Infantry and Cavalry School. Number four of the series (Kansas City: Hudson-Kimberly Publishing Co.) is a republication of essays by Captain F. N. Maude of the English Engineers, which originally appeared in the *Civil and Military Gazette* of Lahore, India. Captain Maude's vigorous style and trenchant criticism make his papers always stimulating, and he is sure to select topics bearing directly on the military problems of the day. Number five is an English translation by Lieut.-Gen. East, C. B., of the German General von Arnim's method of rapid instruction in outpost and skirmishing duty. With its maps, it makes a valuable handbook for the peace-time drill, showing what varieties of invention a bright officer has at his command for imitating occurrences of actual war. The same publishers bring out a second edition of Lieut. Root's 'Military Topography and Sketching,' brought down to date by the Fort Leavenworth Instructors in Engineering.

The first of the flood of publications on Alaska in its gilded aspect to reach us is Miner W. Bruce's 'Alaska: Its History and Resources, Gold Fields, Routes and Scenery' (Seattle: Lowman & Hanford). The author writes in good faith and soberly, from six years' experience, supplies a large number of excellent illustrations, and a map of the Territory. A new manual to an old resort is 'The Mammoth Cave of Kentucky,' by Horace Carter Hovey, A.M., D.D., and Richard Ellsworth Call, A.M., Ph.D. (Louisville: J. P. Morton & Co.). It is, in its appointments of letter-press and pictures, the best guide to the cave we have ever seen, and its science is conformable to our present knowledge. A handbook was demanded by the recent Historic Festival in Plymouth, Mass., July 28-August 3, and is given in 'Old Plymouth Days and Ways' (Plymouth: A. S. Burbank). It is a prettily illustrated souvenir, and among its scraps is a catalogue of the loan exhibition in the Winslow House.

The 'Album Géographique' of MM. Dubois and Guy (Paris: A. Colin et Cie.) has reached a second volume, which is devoted to the tropics, except those parts included in the French colonial possessions. For those a special volume, showing their aspect and development, is promised. The present is divided into fifteen sections, each containing about thirty pictures of the scenery, habitations, and people of varying degrees of interest and excellence. In some instances these are so old that, taken together with the descriptive text, they are misleading as regards present conditions. This is especially noticeable in the section on East Africa. The sources from which the materials have been drawn seem to have been unwisely restricted mainly to French and German works.

Nonagenarian contributors to the magazines are rare enough in any country, but the *New England Magazine* for August has one such in the person of Mrs. Elizabeth Buffum Chace, who writes on "Old Quaker Days in Rhode Island" in the town of Smithfield, where her ancestors settled. It is in reminiscence that the old betray their age, but this charming little picture of bygone days and customs is compact, orderly, pithy, and suggestive of anything but superannuation. Indeed, it illustrates one observation of the writer worth repeating. She says of the Buffum tribe that "they spoke the English language correctly; and I can think of no other reason for the class distinction which certainly did exist in this community except that it was determined by the different manner in which the language was spoken. There were families scattered right along this country road, owning farms, behaving as irreproachably as their neighbors, and dealing as honestly, who had no social relations with these same neighbors. They probably used two negatives where there was need of only one, and put plural personal pronouns with singular verbs."

A discussion, chiefly interesting for the curious views expressed, has been going on for some months in the London *Author* with regard to the practical use of the perplexing English subjunctive. A new turn has been given to it by the publication in the June and July numbers of tables stating the results of a search for the inflectional subjunctive in ten volumes of standard modern prose, including works of Dowden, Hardy, James, Lang, Lecky, Meredith, Morley, Stephen, Stevenson, and Traill, and aggregating about 900,000 words. The statistician's results are that subjunctives of any verb except *be* are used by all these ten authors only fifteen times. We suspect that only the third person singular of the present subjunctive of such verbs has been searched for, and that it was with reference to this alone that the discussion has arisen; but, however that may be, a subsequent correspondent deduces from the tables the following "practical" rules for British authors, which we hereby pass on to the American guild, as in duty and courtesy bound: (1.) "Only use the subjunctive mood of the verb *to be*"; (2.) "The subjunctive of the verb *to be* should only be used [he probably means, should be used only] after *if*."

The *Annales de Géographie* for July opens with a tentative sketch of a botanical chart of France, illustrated by a map of the Perpignan district so colored as to show the different kinds of forest trees and their location. This is followed by papers upon the river Oder, the physical geography of the Caucasus, and Tierra del Fuego. Dr. O. Nordenskjöld, the leader of the Swedish exploring expedition to this forlorn land, gives the impressions received during a twelve months' sojourn. The vegetation consists "in great part of evergreens, forming virgin forests almost as dense as those of the tropics, which, moreover, they recall in various ways." Their silence is deathlike. Even the war of the perpetual tempests does not penetrate it. There are no bird-sounds but the occasional cry of a parrot; no insects but spiders. In describing the Ona Indians, the most numerous of the primitive inhabitants of Tierra del Fuego, the writer says that perhaps no people are so badly protected against the climate as they. The paper is illustrated by some interesting photographs. The editor calls attention to the scantiness of our knowledge of the borderland between Algeria and Morocco,

and remarks also that since the Spaniards have made Melilla a free port, a new trade-route has been opened by which arms and European products are carried to the south. In an interesting note a recent official order forbidding further emigration to Siberia, on the ground that there is no more available land, is explained. The nomad Kirghiz, with their enormous herds, now have possession of all the remaining unoccupied land near fresh water. Until they are provided for, emigration will be stopped.

The quarterly statement of the Palestine Exploration Fund for July announces that the excavations at Jerusalem have ceased on account of the termination of the firman permitting them, but that application has been made to the Porte for leave to undertake excavations elsewhere. It has been a source of regret that no specimens of Hebrew writing have been discovered in the course of the work. Just at the close, however, a cornelian seal was found with a name inscribed in characters of the sixth century B. C., according to Prof. Sayce, or "about 450 B. C., or from the time of Ezra," according to Col. Conder. A preliminary account by M. Clermont-Ganneau of the extraordinary fifth-century mosaic map of Christian Palestine, Egypt, and possibly Asia Minor, recently discovered at Mâdeba, a Moabite city to the east, endeavors to identify some of the geographical names displayed. A plan of Jerusalem in this map may throw light on the disputed questions connected with its topography. Other articles are on the water of Jacob's Well, the Damascus railways, and the length of the Jewish cubit by Col. Watson. By a comparison of a large number of fresh Syrian barleycorns with some taken from an Egyptian grave of the third century of our era, he concludes that it was very nearly 17.79 inches long. The barleycorn, it may be added, his researches lead him to believe, is the best natural object which could have been selected as a unit of measure.

The Conference on uniform entrance requirements in English, which met in New York in June, consisted of representatives from the college and secondary school associations of the Eastern, Southern, and North Central States. Its deliberations resulted in the removal of several objectionable books from the prescribed list; in a list of books for 1901 and 1902 that does not differ materially from that of 1900, and in the addition to the requirements of clauses recommending the secondary schools to offer instruction in elementary rhetoric, and allowing colleges to examine candidates on English grammar and, to a very limited extent, on certain periods of English literature. The Conference only partially completed its work, and adjourned to meet at Christmas in Philadelphia.

The number of matriculated students attending German universities during the summer semester of 1897 is indicated by the first figures, the whole number of hearers by the second figures, and the number of women among the hearers by the third figures in the following list: Berlin, 4705. 344, 114; Bonn, 1889, 103, 13; Breslau, 1541, 83, 22; Erlangen, 1140, 13; Freiburg, 1449, 95; Giessen, 663, 29; Göttingen 1123, 72, 34; Greifswald 834, 19; Halle 1534, 101, 6; Heidelberg, 1230, 92; Jena, 704, 50; Kiel, 727, 37; Königsberg, 695, 31, 11; Leipsic, 3064, 157; Marburg 1042, 48, 7; Munich, 3871, 160, 2; Academy of Münster, 487, 10; Rostock, 499, 10; Strassburg, 1016, 31; Tübingen, 1289, 12; Würzburg, 1430, 13. The whole number of matriculated students was 30,982, and hearers 1519, of whom 207 were women; students of theology 4326, of law 8368, medicine 8232, and philosophy 10,006. There was a marked decrease of students of theology and medicine, and an increase of students in the philosophical department, especially in philology and natural science. There seem to have been no women hearing lectures at Leipsic, although there were several in attendance last winter.

The professors of the Berlin University, Wagner and Sering, in the department of political economy, and Erich Schmidt, in that of modern philology and literature, speak in the highest terms of the attainments and achievements of the women who have attended their lectures during the last three semesters. A year ago there were 39, in the following winter 95, and in the summer semester just closed 114 in attendance. Many of these were not only "hearers," but also "doers of the word," inasmuch as they worked diligently and successfully in the seminaries of their respective professors. Prof. Schmidt mentions especially one young lady, a Russian, who had already taken the degree of Ph.D. at the University of Berne, and whose dissertations in his seminary were "the best." Several women have also carried on independent investigations with remarkable success in the physiological institute in the departments of physics as well as of microscopic biology.

On May 31 Elsa Eschelsson read and defended her thesis before the law faculty of the University of Upsala, and received the degree of Doctor juris, with the customary badges of this academical promotion, namely, a ring, a diploma, and a doctor's hat. Her thesis was "On the Idea of Donation in Swedish Law." We may add that the hat was not quite as tall as that given to men. This difference was, however, purely æsthetical, and had no reference whatever to the comparative height of her scholarly attainments. Soon afterwards she was admitted to the faculty of the same university as privat-docent, and will lecture on civil law.

—In the month of November last, the committee appointed by the Harvard Board of Overseers to visit the Department of Composition and Rhetoric called upon the students in all the English courses of the college to prepare a composition upon the following subject:

"Describe the training you received, or the experience you may have had, in writing English before entering college, giving the names of the schools in which, or the instructors from whom, you received it; and then, speaking in the light of your subsequent work and experience in college, point out wherein your preparatory training now seems to you to have been good and sufficient, and wherein it seems to have been defective and to admit of improvement."

In response to this call over 1,300 papers were handed in. The students writing them came from nearly 500 different preparatory schools in all parts of the country and in Europe, and some from other colleges. In the papers they described the systems in use in all these institutions at the time the writers belonged to them—that is, within a comparatively recent period. After going carefully through this large mass of raw material, the committee prepared a report, which has recently been submitted to the Board of Overseers, and will be published during the month. In view of the active discussion of "College English" occasioned by the previous reports of this committee, the forthcoming one can hardly fail to be looked forward to with interest by all teachers engaged in the secondary education. It is understood that in it the committee have reached certain final conclusions in regard to the methods of instruction in the art of writing English now in use, and suggest important modifications; their recommendations being based on the evidence contained in the 1,300 papers they have examined, numerous extracts from which will accompany the report to fortify the conclusions of the committee. The originals are to be bound in volumes, and placed for future reference in the College Library. The committee consists of Charles F. Adams, Edwin L. Godkin, and George R. Nutter; and this, the third report made by them, will also probably be the final one. The previous reports, it will be remembered, were editorially discussed in the *Nation* at the time of their publication.

—Proposals for a new 'Lexicon Platonicum,' signed by Prof. Lewis Campbell and Mr. David B. Monro, Provost of Oriel College, are now in circulation. These proposals begin by calling attention to the need, long felt by classical philologists, of an 'Index Platonicus' corresponding to the 'Index Aristotelicus' published in 1870. The rarity of Ast's 'Lexicon Platonicum' (1835) is then adverted to. It can scarcely be had now at any price under $16. Its treatment of important words is not exhaustive, and its arrangement is defective. It of course contains no record of the extensive and minute research recently devoted to Plato's use of the particles. Mitchell's 'Index Græcitatis Platonicæ' (1832) is still more defective and has been long out of print. For all the minutiæ of Plato's habits of speech, and for the changes observable between his earlier and latest styles, German monographs, not easily procurable and of uneven merit, have to be consulted. These have, for the most part, appeared since Ast's Lexicon. The most practicable scheme is therefore to prepare a new lexicon based upon Ast's and on important monographs which have appeared since his day. The mere cost of reprinting Ast is estimated at $3,500. The cost of the necessary revision of that work would bring up the expense of a new edition to $7,250. This outlay would not be covered by the demand for such a revision when completed. Accordingly, the help of learned societies and the liberality of individual scholars is appealed to. The Oxford Philological Society has shown interest in the matter, and other learned English societies are expected to join in furthering it. The subject has also been mooted in the Paris Académie des Inscriptions. It may be hoped that there are societies in America which will take up the matter. If, by the combined efforts of these societies, $4,000 can be raised, a committee taken from their membership could be formed with good hope of success in the work. Such a committee might invite donations payable in three annual instalments, and could eventually appoint an editor, who should be empowered to organize and direct the undertaking, obtaining help from competent scholars. Finally, the book could be published at something like $10.50 net for subscribers, and about $12.50 for the public. Original subscribers would be entitled to one

copy free of charge. A sale of 350 copies would cover expenses, and any profits might go to the subscribing societies.

—*Scribner's* for August is a "fiction number," and contains some tales which are not noticeably different in character or interest from the thousand and one printed between other covers; Mr. Rudyard Kipling's ".007" is an exception. It is a story about locomotive engines, the locomotive being personified and talking in a dialect which Mr. Kipling seems inferentially to impute to the engineers and drivers of locomotives. If he is right, they talk a language very like that of the loafers and blackguards who hang around village stations. The story appears to be an allegory on the theme that pride goes before a fall, which of course applies to locomotives as well as to men. Mr. Kipling has evidently made a realistic study of the machinery of a locomotive, and introduces a great many technical terms of which we never heard before, and which are no doubt accurately used. The question whether the dialect is good realism or not we must leave to realists. It is a low, blackguardly, vulgar language, and may be said to mark one of the boundaries of magazine realism. An English-speaking magazine audience will not stand filth and obscenity, although filth and obscenity are highly realistic; and hence we have to go for them to Zola, whose liberty some of our great masters of fiction must often envy. What a splendid theme (but for this) an allegory of fire-engines in the old days in this city would have been! If this barrier could be once broken down, as it has been in the domain of certain newspapers, a fiction number might be produced which would make an unparalleled sensation. But realism with us has its prudery, of which the rules are thoroughly understood in the magazine world.

—The August *Century* is altogether an excellent collection of papers. In "The Lordly Hudson" Clarence Cook praises the scenery of the Highlands, and seems not to repel the opinion that the Creator, in designing them, had an eye to their effect as seen from the deck of a North River boat. Thomas Dwight Goodell contributes a charming "Journey in Thessaly," which deserves preservation in some form. "The Alaska Trip," by John Muir, is full of valuable information, as is also the article called "Down to Java" by Mrs. Scidmore. Norway, past and present, in contrast, is treated of by Horace E. Scudder and Hjalmar Hjorth Boyesen. All these are more or less illustrated; in fact, almost every paper in the number has something in the way of illustrations. General Schofield's article on "Controversies in the War Department" contains, besides some weighty professional criticism, an important private memorandum of his made in May, 1868, containing facts never before made public relating to the impeachment of Andrew Johnson. It seems, in brief, that when the impeachment trial had reached a stage at which the issue hung in the balance, Mr. Evarts, who was defending the President, sent for General Schofield, and asked him to consent that "at any time before the close of the impeachment trial" his name might be sent in as Secretary of War in place of Mr. Stanton. General Schofield asked permission to confer with General Grant, and permission was given to speak to the latter "incidentally," but not to refer to the proposition as coming from the President. Schofield therefore told Grant that he had reason to believe that such a proposition would be made, "upon the theory" that the President would be acquitted; on which Grant cautiously said that he supposed there was "no reasonable doubt" of a conviction, but that if such was not to be the event, he would be glad to have Schofield in the War Department. Another interview with Mr. Evarts followed, in which that gentleman stated that impeachment was then seen to be a mistake by the Republicans, and the question was "how to get out of the scrape," and that certain Senators had suggested Schofield's nomination in order that the Senate "might vote upon the President's case in the light of that nomination." The upshot of it all was that on April 24, 1868, the nomination was sent to the Senate, about a month later the impeachment failed by a single vote, and Schofield was unanimously confirmed. Curiously enough, on April 25, Grant confidentially requested Schofield not to accept, having changed his mind because (the editor of the *Century* suggests in a note) he feared the effect the nomination would have on the impeachment proceedings.

—The *Atlantic Monthly* has several papers worth reading. John Muir writes about the "American Forests," and tells the sad story of their destruction with some new touches. His account of the industry of the "Shake-maker," and his anecdote of the curious trade in timber-land claims carried on by the mariners of a certain steamship line, who, on arrival in port, make a "bee-line" for the forests, where they preempt land for their terra-firma employers at so much a head, form a striking contribution to the literature of this subject. Dr. Geo. Birkbeck Hill's first instalment of "Unpublished Letters of Dean Swift" is accompanied by an illuminating gloss by their editor. We see in these letters an unerring reflection of the writer and of the times. On August 2, 1715, for instance, Swift knew as little as any one what was going to happen, and writes, "The story of an invasion is all blown off." The Earl of Mar had then left London to raise the Highlands for King James. Swift's ignorance was the ignorance of half England. Mr. William Allen White gives an account of a "Typical Kansas Community," which should be read in connection with the succeeding essay on "A Massachusetts Shoe Town," by Alvan F. Sanborn. Mr. Sanborn's theory of the present condition of Massachusetts seems to be that a democratic state is in process of being replaced by what he calls "stratified" classes. But the stratification cannot, on his own evidence, be said to have reached a very advanced stage. To a visitor from Austria, Spain, or even from England, we doubt if the classes, orders, or castes of Brompton would seem very clearly marked. Sociologists often forget that a real social class cannot be formed by money alone; it must have rights, duties, customs, and ideas of its own. But there is no doubt which way the wind is blowing. William Roscoe Thayer has a thoughtful article on "The Pause in Criticism—and After"—a plea for individual as distinguished from evolutionary literary criticism of the Taine order. He notes the disappearance of "authoritative voices" in criticism. Goethe, Arnold, Lowell—who are their successors? It is absurd, as Mr. Thayer very truly points out, to determine a writer's value by such tests as *la race, le moment,* and *le milieu,* without also inquiring what he has to say. Several writers may be mentioned—among others, Shakspere—who remain important personages in literature, though little or nothing is known about the personal influences or circumstances under which their work was produced. If any one doubts whether Mr. Thayer's protest is called for, let him read Enrico Ferri's paper on "The Delinquent in Art and Literature," and see what Taine's more advanced successors are doing. Here we have the new criminological search-light turned on art and literature with extraordinary critical results. According to the writer, " nearly all criminologists" classify criminals under five heads, as first arranged by him. This is rather depressing to those who have been in the habit of believing that crime was as various as human character; but it is not so surprising as to find the old dispute about *Hamlet* settled by his being classed as a "mad criminal," while *Macbeth* is put down as "the instinctive, or born, criminal." His wife did not think so.

—*Harper's* for August has a curious illustrated article by Fletcher Osgood called "A State in Arms against a Caterpillar," describing the operations of the Massachusetts Board of Agriculture in its war of extermination against the gypsy-moth. This creature was brought over here twenty-six years ago by a French *savant,* and, escaping by accident, has since infested Medford and a large adjoining district. So frightful have been the ravages of the insect in Russia that it is supposed that it may, if unchecked, ravage the whole Atlantic Coast, and hence the State of Massachusetts has resolved to exterminate it. Not with a sword, but with petroleum fire and burlap bands and a Board of Agriculture of fifty members, with the Governor at its head, and under them specialists and a uniformed service and a plant, does she seek placid quiet in freedom from this detestable bug, whether in the shape of caterpillar, pupa, moth, or egg. The board seems to have absolute war powers, for not only have 42,000,000 trees, but more than 400,000 buildings, walls, and fences been inspected. The results, according to the writer, justify the expenditure of time and money, some 4,000,000,000 of the enemy having been destroyed, and the pest having been prevented from spreading or from seriously injuring the district in which it first made its appearance. With sufficient appropriations, Massachusetts promises to extirpate him from the New World to the last egg. The writer somewhat impairs the force of what would otherwise be a very striking article by suggesting that, in his opinion, Congress should help the State. He mentions absolutely no reason for thinking that the State needs any help. The chief illustrated subjects, not running on serially, are "The Inauguration," by Richard Harding Davis, with drawings by C. D. Gibson and T. de Thulstrup, and the "Hungarian Millennium," written and illustrated by F. Hopkinson Smith. Owen Wister has one of his short Western stories, in which, to our mind, he employs his undeniable cleverness and gift for story-telling unprofitably. We cannot help suspecting that he is a victim of the pseudo-patriotic virus which is doing so much to poison letters.

—Five new volumes in the series of 'Fa-

mous Scots' (Charles Scribner's Sons) show that Scotland and her sons stand ready, as of old, to maintain the undying glory of her elder offspring, even though in some cases the footprints are but thin and few. 'Tobias Smollett,' by Oliphant Smeaton, is valuable enough as setting forth the facts of the novelist's career; but it is disfigured by a rampant style, the flowers of the most irritating journalism strewing the pages, to use the author's own accurate and novel illustration, "as thick as leaves in Vallombrosa." 'James Boswell,' by Keith Lease, is less offensive, but is written throughout in a semi-jocose tone, exactly what the author complains of in Boswell's contemporaries—that no one could take him seriously. There is the usual attack on Macaulay, yet his demonstration of Boswell's fatuity is confirmed on every page, and Mr. Lease remarks, with great naïveté, that it is lucky the Temple correspondence was unknown to Macaulay, as it would have made his description more brilliant. Every anecdote accumulated to prove Boswell's constructive skill seems only to set in a clear light his congenital mental weakness, for which his biographer is forced to find an explanation in heredity. The life of 'Thomas Chalmers,' by the Rev. W. Garden Blaikie, is lively and sympathetic, while dignified in tone. If in places the evangelical temper seems too prominent, it must be remembered that only under the influence of such feelings could a biographer really enter into Dr. Chalmers's motive and methods. 'Fletcher of Saltoun' receives from G. W. T. Omond all justice; but after our very scanty materials have been drained dry, little is left beyond a tradition of eloquence, honesty, and patriotism, rendered ineffective by a bitter and impracticable temper. The Blackwood group of writers—Wilson, Galt, Moir, etc.—is fairly well handled by Sir George Douglas, but one doubts if his most earnest efforts will do much to revive what seems at this day their strangely exaggerated popularity and influence.

CROMWELL'S PLACE IN HISTORY.

Cromwell's Place in History. Founded on Six Lectures delivered in the University of Oxford. By Samuel Rawson Gardiner, D.C.L. Longmans, Green & Co. 1897.

"With Cromwell's memory it has fared as with ourselves. Royalists painted him as a devil; Carlyle painted him as the masterful saint who suited his peculiar Valhalla. It is time for us to regard him as he really was, with all his physical and moral audacity, with all his tenderness and spiritual yearnings, in the world of action what Shakspere was in the world of thought—the greatest because the most typical Englishman of all time. This, in the most enduring sense, is Cromwell's place in history. He stands there, not to be implicitly followed as a model, but to hold up a mirror to ourselves wherein we may see alike our weakness and our strength."

These are the words which conclude Mr. Gardiner's admirable and instructive essay on 'Cromwell's Place in History.' They bring into view a side of the Protector's character which has been too much overlooked. He was an Englishman of Englishmen, he was a typical representative of the nation which, under his guidance, became the leading Power in Europe. Every feature in Cromwell recalls some specially English characteristic. His sagacity in discerning what was immediately practicable is what we mean by English common sense. This quality has been possessed by every man who has permanently influenced England; it was the property of all the Tudors; it is to be found in men as different from one another as Walpole, William the Third, Pitt, Peel, and Palmerston. The want of it was the ruin of the Stuarts. They some of them had a touch of genius; they most of them possessed more than average capacity; they none of them, not even Charles the Second, were persons of sound sense. Cromwell's decisive energy at every crisis is the quality which lies at the basis of half England's greatness. The men who snatched the dominion both of America and of India from France had many defects and many weaknesses, but they had each and all of them this in common: they knew, when the supreme moment came, how to act with decision. The qualities which gave victory to Wolfe at Quebec were the qualities which made Inglis defend Lucknow against fearful odds, and which replanted the standard of England in Delhi. The religion, again, of Cromwell is exactly the form of religion which has influenced every Englishman who has been both a man of piety and a man of action. No mistake of Carlyle's was greater than the idea which he certainly impresses on his readers, that the religious convictions of Cromwell differed in their nature and in their sincerity from the convictions which have governed and do govern the lives of hundreds of Englishmen. Cromwell would have felt himself quite at home with Havelock when marching to Lucknow, or with Gordon when defending Khartum.

Nothing assuredly truer has been said about the Protector than that he was a typical Englishman, and if Mr. Gardiner's delightful little work did no more than impress this fact upon the world, it would have attained its object and rendered a lasting service to the students of history. But though Mr. Gardiner's estimate of Cromwell is, we doubt not, true, we may hesitate to believe that it contains the whole truth, or represents the complete and final judgment which the world will pronounce on the Protector. A man may be the most typical Englishman of all time, and yet not exactly the greatest of Englishmen, and Mr. Gardiner's description of his hero—for Cromwell has become almost as much Mr. Gardiner's hero as he is Carlyle's—hardly answers at least two questions which inevitably suggest themselves to any one who studies Mr. Gardiner's estimate of the Puritan leader.

Why did Cromwell's career constitute the most extraordinary combination of apparent success ending in undoubted failure?

The higher our estimate of Cromwell's genius, the greater is our difficulty in answering this inquiry. If any one asks how Napoleon fell from being the despot of Europe to the position of a helpless prisoner, the answer lies ready at hand. No man of transcendent powers ever made a greater number of moral and intellectual blunders; his triumphs are balanced and even enhanced by his failures. The expedition to Egypt, and still more the return from Egypt, prepare us for the invasion of Russia and for the dastardly flight back to France. The Emperor was one of those men in whom there really seems to have existed something like the alliance between genius and madness. Napoleon, moreover, did not fail in the sense in which Cromwell failed. To have achieved great feats, to have exhibited to all the world his unrivalled powers, both as a soldier and as a statesman, to have created a Napoleonic legend, to have made himself a name which can never be forgotten as long as men remember the history of France, to have placed himself among the rulers of men side by side with Alexander, with Cæsar, and with Charlemagne, are achievements which must have gratified the most ambitious dreams of Bonaparte. A few years' imprisonment must have been to him but a small price to pay for the gratification of his love of fame.

If we are asked why Cromwell's work fell to pieces with the end of his life, and why it is that not a single institution can be traced to Cromwell as its author, it is a far harder matter to find a reply. During his lifetime Cromwell never met with a reverse; in everything which he undertook he succeeded. If we look at the immediate results of his actions, we might say that he never made a blunder. Is not the true answer one which Cromwell's admirers and even his assailants are not willing to give? Is it not that, in spite of all his great qualities, Cromwell does not rank high among statesmen? No fair judge can place him side by side with men of great creative genius. Alexander, Cæsar, Constantine, Frederick the Great, stand apart and form a class of their own in virtue of having each achieved permanent results. They each knew how to build up, they each became the representative of great movements, they each looked to the future. The peculiarity of Cromwell is that he fixed his eyes exclusively upon the requirements of the moment. Never did man seize with more unerring sagacity upon the measures which best met the immediate wants of the time. In this quality, as in others, he was emphatically English, and, in virtue of this keen insight into the needs of the day, he avoided errors and achieved immediate success. But of him it might be said, as it has been said of Peel, that his insight far exceeded his foresight, that he was much more clearsighted than longsighted. There seems to have been something in his very belief in Providence which prevented him from taking thought for anything like the distant future.

We may trace this characteristic in all his actions and even more in his omissions. It explains how it happened that he never, in all probability, definitely determined who should succeed to the Protectorate. It is incredible that he entertained any fixed design of making Richard his successor. He was assuredly not deficient in knowledge of character. He was not blind to his son's defects, and it needed but slight knowledge of Richard to perceive that he had none of the qualities required in a man called upon to fill a position which at the very lowest demanded both experience in affairs and indomitable resolution. Cromwell undoubtedly wished to maintain a system of parliamentary government, yet he never understood that parliamentary government of any kind would be impossible if he dissolved his own Parliament the moment he found himself in disagreement with it. It is not certain that as regards Ireland Mr. Gardiner does full justice either to the Puritans or to their leader. The exaggerated admiration of Carlyle and Froude ought not to conceal from us the fact that the policy of Cromwell, if it had been fairly and per-

manently carried out, would have made every Irish Protestant loyal to the English connection, and that this is a good deal more than the rulers who succeeded Cromwell achieved. But it is certainly characteristic of the Protector not to have taken into account many of the results which would inevitably flow from his Irish policy. He can hardly have hoped to extirpate Roman Catholicism, but nothing short of extirpation would have made his action towards the Irish Papists a political success. You cannot by persecution transform rebels into loyal citizens.

The case of Ireland, however, is peculiar, and, as we have said, the policy of Cromwell might have achieved at any rate more success than the efforts of succeeding statesmen. The blunder of blunders was the execution of Charles. To urge that Cromwell strove hard to avoid this catastrophe and wished till the very end of 1648 for a conference with the King, and that, to use Mr. Gardiner's words, "he could but know that the pleadings of his own heart were reinforced by every motive of policy," * is to damn Cromwell's statesmanship. What Mr. Gardiner's words mean is that, to meet the immediate difficulties of a tremendous crisis, Cromwell overlooked every motive of policy, and purchased temporary success at the sacrifice of the future of Puritanism. The dangers of sparing the King's life were great. All that one need contend is that they were not nearly as great as the dangers involved in his death. The execution of Charles I. insured the restoration of Charles II. The Whig statesmen of 1689 read aright the lesson of 1649. It is not the death of a King, but his banishment, which involves the ruin of a dynasty. It may of course be said, and with truth, that Cromwell expected a longer life than he was granted by Providence; that if he had remained at the head of affairs, say till 1670, he would probably have died acknowledged King of England, and have become the founder of a new race of kings. This is true, but the very fact that Cromwell suffered so much to depend upon the continuance of his own life betrays exactly the weakness which marks all his policy—the habit, that is to say, of looking to the present and averting his glance from the contemplation of the future.

But Cromwell, we shall be told, had at any rate wide schemes for the formation of a great Protestant alliance, of which England was to be the head. This Cromwell's admirers are accustomed to represent as the heroic and the romantic side of his statesmanship. Mr. Gardiner's little book, however, does much to dispel our belief in the Protestant hero. Cromwell did, it is true, dream of a grand alliance for the protection of Protestantism, but he soon found, with his usual clear-sightedness, that his visions or schemes were out of date. The Peace of Westphalia had in effect closed the era of religious wars. The idea of a Protestant alliance was practically exchanged for the commonplace effort to extend the colonial dominion of England. Nor, if Mr. Gardiner is to be trusted, was this effort crowned with any very splendid success. Whether the historian is in this matter just to the Protector is open to question; but it would be the height of presumption for any critic to treat lightly the conclusions of the best-informed and the most impartial of inquirers, and Mr. Gardiner arrives at the result that in his foreign policy Oliver made a definite mistake. He attempted to render England great by land as well as by sea, but to attempt this was to overstrain the resources of the country. "With her small population and her still restricted commerce, could England bear the double strain to which France proved unequal and be great on land as well as great at sea?" If, with Mr. Gardiner, we answer this inquiry in the negative, we are forced to the conclusion that in his foreign policy Oliver, from want probably of sufficient training, failed to show his usual insight; but if his foreign policy was miscalculated there is really no part of his statesmanship which, if it be judged by a high standard, can be called successful. Energy, resolution, and knowledge of men, may make a man a powerful ruler, but for high statesmanship something further is required. The founder of new institutions must look to the future, and Oliver, with all his greatness, lacked foresight. If we are to adopt Mr. Gardiner's formula, and say that the greatness of the Protector lay in his being the most typical Englishman of all time, we must add that he shared one of the most marked of English defects—the incapacity for regarding anything but the requirements of the day.

Why has popular tradition painted Cromwell as a hypocrite?

Much may be due to the slanders of the Restoration—libertines will always deem piety to be hypocrisy; but it is folly to attribute lasting effects to malignity and calumny. It is the gravest of errors to imagine that the view taken of a man by his contemporaries can be wholly without foundation. If men of all classes and all parties came to distrust the Protector, we may be certain, not that he was a knave or a hypocrite, but that there was something in his character and career which naturally excited distrust. Nor if any one looks at Oliver's conduct dispassionately is it hard to see what this "something" was. He was a man who, beginning his life as a genuine religious enthusiast, became a successful and, we may fairly add, a not over-scrupulous statesman. To suppose that he was a hypocrite, or that his religious convictions were not genuine, is to misread human nature. It is absurd to fancy that the religious language to be found in his speeches did not express real feeling. Nothing is more unlikely than that the feelings of Cromwell's heart belied his religious profession. What, however, is pretty certain is not only that he became more and more interested in matters of state which led to the use of statecraft, but that he made his religious expressions part of his statesmanship. Policy and piety do not easily go hand in hand, and there is one danger to which a religious statesman is constantly exposed. He may act on higher principles than his opponents, but he is almost driven to the pretence of acting on principles of a more exalted character than those which he really follows. He deceives himself, but he deceives others also. No one can have a moment's doubt that Walpole's morality was of a far lower type than the morality of Cromwell. The Whig Minister was in the strictest sense incapable of understanding the religious yearnings of the Protector, but, just because of this difference, Walpole was the more honest man of the two. The Minister was a cynic; he took a low view of human nature, and made not the remotest effort to raise the tone of his generation. He acted more or less on the principle that every man had his price, and that the price could usually be expressed in pounds, shillings, and pence; but there was about him no touch of humbug; no one felt that he pretended to a conscientiousness which he did not possess. In dealing with Cromwell, on the other hand, no one ever felt sure, and to this day no one can feel sure, how far his action was guided by policy and how far by principle. We know, for example, that he wished to save Charles. We also know that he at last and suddenly adopted the views of enthusiasts who were convinced that justice demanded the death of Charles Stuart. Who shall say whether Cromwell was swayed by the dictates of immediate expediency, or whether he was carried off his feet by the contagious influence of a religious fanaticism with which in his heart he felt strong sympathy? This is an inquiry which no man can answer, and for the best of all reasons: it is an inquiry to which Oliver himself might well have hesitated to reply. A keen perception of the demands of the moment, righteous indignation at Charles's duplicity, the moral satisfaction of finding himself once more in harmony with the sentiment of the saints, may each and all have contributed to Cromwell's decision; and it was characteristic of the man to carry out at once with the utmost vigor the course of action which he had finally decided to adopt.

But though the mixture of politic calculation with religious fervor or fanaticism is not hypocrisy, it assuredly excited and ought to excite the suspicion of critics and associates. When we add to this that Cromwell, like every other revolutionary leader, suffered morally from the corrupting atmosphere of revolution, and that the religious fervor of his early life was clearly a good deal cooled by the varied experiences of his later career, we cease entirely to wonder that former friends, no less than ancient foes, failed to see how strong were to the last the Protector's religious convictions, and believed that astounding triumphs had been the reward of profound dissimulation. But here again it is fair to note that Mr. Gardiner's formula has an application which he does not himself give to it. Cromwell in his faults is the representative of his country. When foreign critics speak out freely the accusations which they bring against England, they charge the country with humbug or hypocrisy. Every Englishman, and perhaps most fair-minded Americans, will assert that the charge is unjust. What, however, are the circumstances which give it currency and plausibility? They are in substance that England in her foreign policy constantly professes to act on higher principles than those which govern the policy of other nations. This profession is by no means without solid foundation. No one, for example, who studies the history of the abolition of slavery can doubt that the abolitionists of England, as also the abolitionists of America, were really governed by hatred of iniquity. No one, again, can doubt that the belief in the benefits conferred by English administration upon Egypt tells for a good deal in the resolution of Englishmen, which is growing firmer and firmer every day, to keep a tight grip on the land they have occupied. But

* 'History of the Great Civil War,' vol. III., p. 557.

while this is true, it is also true that English philanthropy or benevolence is apt to coincide with the real or supposed interest of England, and that England does not always act up to her avowed principles. The cynicism of a statesman like Bismarck excites less distrust and condemnation than does the English avowal, though often perfectly sincere, of high-principled disinterestedness. Cromwell remains in his failings the type of English statesmanship.

BUCKLEY'S METHODISM IN THE UNITED STATES.

A History of Methodism in the United States. By James M. Buckley. In two volumes. Illustrated. New York: The Christian Literature Society, 1897.

The literary matter in these volumes is also published in one volume of 714 pages in a binding uniform with the other volumes of the "American Church History Series." The excess of 237 pages in these volumes over the one-volume edition is occasioned by the introduction of some 235 portraits and a few other illustrations. The portraits are very interesting, especially the "last-century faces," not all of them "fine"—some of them very homely and rugged—but much more indicative of force and character than those of the nineteenth-century bishops. Some of these, however, are delightful as examples of the typical ecclesiastical countenance, their smile as serenely self-sufficient as that of the Assyrian and Egyptian sculptures of great kings and conquerors.

It commonly happens with church histories that the initial are more interesting than the later stages. So far is Methodism from being an exception that it furnishes the rule with one of its most obvious examples. But, although Dr. Buckley devotes more than 100 pages to early English Methodism, they furnish but a brief and dry compendium of such elaborate histories as those of Stevens and Tyerman. Indeed, his entire work has too much of this character. Facts are set down "in disconnection dull and spiritless." There is a lack of grouping, and we pass from one thing to another with a suddenness that is often startling. There is, moreover, an absence of dramatic sympathy which is very curious. Here is a Methodist of the Methodists, and there is ten times more of the spirit of early Methodism in the pages of 'Adam Bede,' though George Eliot was an agnostic, than in Dr. Buckley's history. He should have been a good portrait-painter for a work so rich in personal interest. But Whitefield and the Wesleys, Coke and Asbury, and the other giants of those days, are bowed off the stage with the least possible characterization. Nor have we any clearer presentation of the doctrinal contents of Methodism, or of the differences between Wesley and Whitefield which were so threatening to the success of the whole business. Properly enough, the emphasis is placed upon the moral reformation involved in the development of Methodism. Wesley's celebrated "Minutes" are here very much in evidence. Another thing that is brought out very clearly is the primacy of Wesley. Louis XIV. was not more the State than Wesley was the Church. The sway of Hildebrand was not more absolute than his. Immensely suggestive, too, is the businesslike fashion in which a great emotional movement was made practical and efficient. It is astonishing how the fashion went everywhere with Methodism, and how quickly the American Methodists adopted it. It is less astonishing, however, because Asbury, as a man of business, was hardly inferior to Wesley.

If Dr. Buckley felt any temptation to be boastful in writing of the rise and growth of Methodism, he withstood it perfectly. An ecclesiastical history was never written more modestly or more truthfully. Where others have endeavored to disguise certain disagreeable facts, he has stripped off the disguise. A notable instance is furnished by Wesley's attitude towards the American Revolution. That attitude, as expressed in 'A Calm Address to Our American Colonies,' was the same as Dr. Johnson's in his famous 'Taxation No Tyranny.' The address was not inaptly described as "a bundle of Lilliputian shafts picked and stolen out of Dr. Johnson's pin-cushion." But Stevens, in his history of Methodism, wrote of Wesley's "frankly correcting himself and acknowledging the right of the colonies in their stern quarrel," and he convinced Bancroft of the truth of this statement and induced him to change what he had written. Yet Bancroft had written nothing but the truth, and it was Stevens who was in the wrong, as Dr. Buckley plainly shows. The letter on which Stevens relied was written before the 'Calm Address.' The wonder is that that address, together with the connection of the Methodists with the Church of England in America, was not fatal to the prospects of Methodism in this country. Asbury was driven into retirement, and the progress of the movement during the war and for some years after was very slow, especially as the Methodists, almost equally with the Quakers, were opposed to war, and so brought upon themselves some disrepute.

If Wesley's attitude towards American independence was unsound, he made great amends by his attitude towards slavery, in splendid contrast with Whitefield's base subserviency and complicity. (Whitefield's missionary labors in America are only briefly mentioned by Dr. Buckley, and their relation to incipient Methodism and to the other sects is not explained.) In their early dealings with slavery, the Methodists followed bravely Wesley's lead. The conference of 1780 required preachers holding slaves to set them free. In 1784 this action was followed up by a demand for the dismissal of preachers refusing to comply. The spirit of Coke, one of the superintendents sent over by Wesley, was precisely that of his chief. Asbury was more compliant. On his motion the conference of 1808 voted that "the section and rule on slavery be left out" of the Forms of Discipline provided for the South Carolina conference. The fact was that Methodism developed in the South much more rapidly than at the North. It was very slow to enter New England, where the reaction from the excesses of Whitefield and Edwards's "Great Awakening" was of long continuance.

Dr. Buckley's treatment of the relations of Methodism and slavery is throughout perfectly simple and straightforward. In his second volume he has three chapters which are wholly concerned with these matters. In the first of these we have an account of the abolitionist secession of the Wesleyan Connection under the lead of Orange Scott and La Roy Sunderland in 1842. This was a return to first principles which had been outraged in 1808 by the withdrawal of the prohibition of slaveholding by lay Methodists. The temper of those anti-slavery Methodists who were not ready to secede was much stiffened by the abolitionist secession. There was an inundation of anti-slavery petitions to the General Conference. But the Sumter gun of this disunion was the anti-slavery demand for the retirement of Bishop Andrews, who had married a slaveholding wife. There was a great debate which ended in the secession of the Southern Methodists, numbering 459,569 members and 1,519 travelling preachers. Henry Clay saw in this secession a menace to the dissolution of the Union, which his Compromise of 1850 did something to delay. The timidity of organized religion was manifested in the entire course of this controversy in the Methodist Church. The issue was forced upon the bishops by the people, in whom the anti-slavery spirit of Wesley still survived.

Dr. Buckley, before entering upon this task, had qualified himself for a courageous treatment of the emotional excesses of Methodism by the study of other similar phenomena in our own time. It is an interesting fact that these excesses, hysterical, cataleptic, and so on, attended the logical and argumentative preaching of Wesley much more than Whitefield's impassioned eloquence. There must still be many Methodists who will resent as wholly inadequate Dr. Buckley's account of these things as the result of "concentrated attention," and his depreciation of them as having no necessary or invariable connection with any moral change. But whatever of sympathy is lacking in his treatment of this matter, there is enough, yet not too much, when he comes to speak of "the typical itinerant." When we consider what the typical itinerant was, his meagre pay, at first about $60 a year, his constant journeyings, the hardships he endured, and the rebuffs which he encountered, his passionate enthusiasm and sincerity, we cease to wonder at the success that waited on his ministry, especially when we consider how often he was selected by Asbury for his work and energized and directed by Asbury's tireless will. After coming to America, Asbury "preached 16,500 sermons, ordained more than 4,000 preachers, travelled on horseback or in carriages more than 270,000 miles." Dr. Buckley asks, "Can his career be paralleled?" Wesley beat Asbury a good deal in the number of sermons, preaching 40,000 after he was thirty-six years old; "generally preaching at five in the morning; one of the most healthy exercises in the world," and travelling 225,000 miles.

Coke, Asbury's co-superintendent of the American Methodists, was a less simple character, suggesting some interesting psychological problems. One of his biographers writes that "he would have been a greater statesman if he had had fewer devices." One of his devices was to get himself made an Anglican missionary bishop of India, the English Wesleyans being slack in missionary enterprise, with the understanding that he would "return most fully into the bosom of the Established Church." Another of his devices (1799) was an elaborate scheme for the adoption of the English Methodists by the Established Church, and still another (1791), behind Asbury's back, had for its object the absorption of the American Methodists in the American Episcopal Church,

The overtures were made to Bishop White. Dr. Buckley probably expected some "dissidence of [Methodist] dissent" when he wrote: "Had such a union been formed, it is certain that neither the Protestant Episcopal Church nor American Methodism would have been what it now is, and it is possible that something better than either might exist."

Only those who are entirely unacquainted with the relations of Methodism in its formative stage to the Church of England will find anything strange in Coke's various coquetries with her. Wesley prized a valid ordination so much that he availed himself of "a rather shadowy Greek prelate" to ordain some of his preachers. When, with Dr. Coke and Mr. Creighton, he ordained two elders for America, and made Coke and Asbury superintendents, he shuffled a good deal to save the appearance of consistency, while in fact he was acting upon a view of primitive episcopacy now generally accepted by the most eminent scholars. In America, Asbury's face was set as a flint against the administration of the ordinances by preachers who were not clergymen of the English Church. But for the Revolutionary War the English Church in America might have absorbed Wesley's Methodists, as the Presbyterians and Congregationalists did Whitefield's. But that war was not only a war of independence for the colonies, it was also a war of independence for the American Episcopal Church and for the American Methodists, separating the former from the Church of England and the latter from its English branch. But long after the power of George III. was broken in America, the hand of Wesley was heavy on his subjects on this side of the Alantic. Their moral laxity, at the present time, as compared with his ideals of temperance and amusement, "softness and needless self-indulgence," would have broken his great heart if he could have foreseen it from the summit of his years.

It is a mistaken idea that the growth of Methodism in America was steady and unimpeded once it got fairly under way. In 1796 there was a loss of nearly 3,000 members; a loss of 11,000 in this and the two preceding years. These losses were mainly owing to the secession of the Republican Methodists under the lead of a certain O'Kelly, to whom the new bishops seemed too much like the old king. His following soon broke up.

In Dr. Buckley's second volume, after the chapters on slavery, to which we have already referred, there are others in which the famous scandals of the Book Concern are overhauled, and various aspects of growth and change are briefly indicated and discussed. There are also chapters on the other "Branches of the Common Root," the African Methodist Episcopal Church, the Wesleyan Connection, and the Methodist Episcopal Church South. The Book Concern is an institution which sends its roots far down into the soil of primitive Methodism, so prominent a feature was Wesley's sale of his writings in the propagation of his religious opinions. Its sales, East and West, are now $2,000,000 yearly, and it distributes $125,000 yearly "to the necessity of saints." Several pages dealing with the educational development are purely external —giving a list of endowments and bequests and little more. Of these one of the most remarkable was that of Dr. Daniel Ayres, a heretic of the heretics, to the department of biology in Wesleyan University—"the best way," he said, "to kill off the old theology." One would gladly know how the old theology is faring among the Methodists of these last days; what changes, if any, it has undergone to meet the requirements of modern thought and science. But of these things we have no mention whatsoever.

Eye Spy: Afield with Nature among Flowers and Animate Things. By William Hamilton Gibson. Illustrated by the Author. Harper & Bros. 1897.

Familiar Features of the Roadside: The Flowers, Shrubs, Birds, and Insects. By F. Schuyler Mathews. D. Appleton & Co. 1897.

Memories of the Months: Being Pages from the Notebook of a Field-Naturalist and Antiquary, to wit, Sir Herbert Maxwell, Bart., M. P. Edward Arnold. 1897.

Vivacious and even quiet popular records of natural-history observations possess a great fascination for the Teutonic race. Other races take pleasure in such records, but they do not seem to find in them the deep satisfaction which Germans, Scandinavians, and English-speaking peoples obtain therefrom. It may be that these latter have lived somewhat nearer to nature, and like to hear the story which charmed their ancestors well and often told. They seem never to tire of accounts of elves and fairies and giants, or, failing these, of the forests and meadows where the fairies might well be at home. The names of our common plants show how much of this fairy and folk-lore is still held in fond remembrance. When, therefore, one with sharp eyes, and keen ear, and a facile pen, and possibly a skilful brush, tells the story of any part of out-of-doors, he is sure of attentive listeners.

It may, perhaps, be true that a part of the charm comes from the humiliating fact that we all like to have our work done for us, and that it is pleasanter to read about the story of nature than to take the trouble to tell it to ourselves. One swinging in his shady hammock, under whispering trees, extracts deep pleasure from the perusal of the records of those who are keeping eyes and ears open in the discomfort of a tropical sun. We are spared the fatigue of actual travel and exposure; another is deftly taking the chestnuts out of the fire for us. And the pleasure is almost as great when one reads about the swamps and thickets and sandhills near home; the accounts are as fascinating as the stories of tropical adventure, provided, always, the account is not *too* instructive. There is one class of readers who get a still greater enjoyment out of such books, namely, those who know the woods and meadows, but who cannot, from lack of time or training, tell the story of the birds and flowers to suit themselves. They delight in the descriptions which others prepare; they appropriate the well-arranged material brought by others. There is, besides, a very large class, happily increasing, to whom such records of nature are guide-books to be tested on the spot. These latter take the score into the forest at daybreak and watch for a false note in the melodies and harmonies. The three latest guide-books are now in our hands. In some respects they are like their predecessors, but each has its own characteristics.

In Mr. Hamilton Gibson's early death, out-of-doors study in this country has sustained a serious loss. His eye, and ear, and hand were always truthful, and this gave him confidence to make wide excursions even into the fields which might be claimed by specialists. But there was, with this confidence, a modesty which led every specialist to welcome him as a friend, and not as a rash intruder. The present book, 'Eye Spy,' is somewhat like the earlier and larger one, which has delighted innumerable readers, 'Bright Eyes.' First of all, it is a sympathetic book; the author, who was at once the writer and draughtsman, always alert, cannot let a single thing worth mentioning escape the telling, and the telling is like a confidential talk among intimate friends about what certain other intimate friends have been doing. A charitable construction is put upon everything, and so the story runs along without a hint of anything unpleasant. Like many posthumous books, the pages contain a few errors which the author, if here, would have corrected. For instance, on page 139 we have Polygaric, where Mr. Gibson would have said Agaric. He would not have placed Sprengel's discovery as far back as 1735 (p. 166), and said on page 167, "It remained for Darwin, seventy years later, to interpret the problem," for at that time Darwin was minus four years old. But it is ungracious to point out errors in proof-reading or editing. Such errors as exist will not prove very misleading to those who delight in the beautifully printed pages, the exquisite delineations, and the story of nature told with an irresistible charm. Mr. Gibson was not spoiled by the schools; he was his own teacher in what was best, and those who have the task of training amateur naturalists should see well to it that they catch if they can the secret of his success in teaching himself. His enthusiasm was never chilled, nor, on the other hand, did it carry him to mawkish sentimentalism. Those of us who had the pleasure of knowing him remember the attractiveness of his enthusiasm —he carried us duller ones along with him whether we would or not; and in his books he does this with all his readers. Countless readers will, with those who knew him personally, treasure these last leaves taken from his portfolio, and express the hope that all of his careful sketches may be given to the public in some permanent form.

Mr. Mathews, whose work hitherto is more or less known to our readers, has given us a faithful guidebook for our roadsides. He does not confine himself strictly to the space between the fences, but he assumes that in most cases the fences are constructively down; and so he takes us on short and very attractive walks by most devious paths, and his book is all the better for it. Birds, flowers, and insects are faithfully considered and described in untechnical language, the whole brought into proper relations with their surroundings. His account can be unhesitatingly commended for summer strolls.

Maxwell's book is rather less limited in its scope than either of the two American works just noticed. More or less antiquarian lore, and here and there a bit of rural economy, a hint of fishing, and so on, carry us a little further afield than when we are guided by Gibson or Mathews. The author says in the preface that his notebooks were slipshod, and this may well be; but, so far as a careful reading has shown, they are slip-

shod for ease of progression, and this in the country is not a fault. Sir Herbert has made his notes on the spot, and hence, though with an appearance of carelessness, they are accurate. And, finally, we may say that the three books taken as the heading for this notice are all laid down on out-of-door lines, and were not first drawn up in a windowless library. We congratulate our readers on the gratification they will have as they add these books to the scores of excellent ones which have preceded them from Walton's time, or even long before, down. The list is a long one, and none of the works can be spared.

A Manual of Aesopic Fable Literature: A First Book of Reference for the Period ending A. D. 1500. [Romance and Other Studies, by G. C. Keidel, Ph.D., Assistant in Romance Languages in the Johns Hopkins University. Number Two. First Fascicule.] Baltimore.

Dr. Keidel's introduction gives a brief statement of the scope of his study and a description of three facsimiles of works whose appearance here is entirely irrelevant. There is no systematic account of the Aesopic Fable, and the fascicule consists of lists of titles relating to the following topics: "History of Aesopic Fable Literature," "History of Related Subjects," "History of Special Fields of Fable Literature," "Definition of Fable," "History of Single Fables," "Tables of Fable Literature," and "Incunabula." The author states that the Aesopic Fable is "in the domain of his habitual studies," but to judge by his present performance he is astonishingly ignorant of the field. A glance at the section "Volkskunde" in the Bibliography of the *Germania*, or at the *Jahresbericht über die Erscheinungen auf dem Gebiete der Germanischen Philologie*, or at the indexes of the great folk-lore journals, will show how lamentably incomplete are the lists mentioned above. For example, Dr. Keidel mentions but six histories of single fables: one by himself in the *Zeitschrift für Vergleichende Litteraturgeschichte*, an anonymous one in *Harper's Magazine*, and one in Bédier's *Fabliaux*, leaving but three independent works. Surely, Dr. Keidel does not suppose that these are all, and yet he says, p. xiii: "With the complete list of books on Fable Literature here cited before him, any student may approach the subject for serious study without great misgivings as to a lack of the necessary material for general investigations, etc." In the list of definitions of Fable the height of absurdity is reached by the citation of "Webster, *International Dictionary*, *s. v.* fable and apologue."

The author has bestowed great pains on the bibliographical details of his work, with some curious results. In citing the *Revue des Deux Mondes*, he gives not only the size, "8vo, 1,272 pp.," but the wholly useless: "Bureau de la Revue des Deux Mondes, 20 Rue Saint-Benoît." In citing Hervieux, 'Les Fabulistes Latins,' he gives five separate entries for the five volumes, and under every one we have: "Librairie de Firmin-Didot et Cie., 56 Rue Jacob." The author says he has made generous use of bold-faced type, and "hopes it will, with the numerous Reference Lists appended, make the present Manual one of easy and rapid reference—an essential characteristic of such a work only too often overlooked by compilers." How generous the author has been is shown on pp. 58-60, where may be found 84 successive lines of bold-faced type conveying—the *number of leaves* in the various editions of the incunabula cited in an earlier part of the work! It is, however, upon the list of incunabula that Dr. Keidel has expended most of his labor. It might be criticised for its contents, *e. g.*, if Vincent of Beauvais is included, so should other mediæval works containing fables be. But there are more serious faults. First, as to arrangement: the works are given in the supposed order of printing, but about a third are merely approximate dates, and why make such an uncertain matter the basis of tabulation? In consequence of this the same work is entered several times because different dates are assigned by different authorities. The only authorities cited in the list of 178 incunabula are: Hervieux, 'Les Fabulistes Latins,' Brunet's 'Manuel,' and the British Museum Catalogue, *s. v. Aesop*. The list of incunabula is followed by several reference lists, most of which are entirely out of place. It is impossible to see why the number of leaves of the folio and quarto editions should be given in a separate list, and that, too, as has been said, in the most prominent type. The list of "Cities Where Preserved" duplicates the list of "Extant Copies," and the "Alphabetical List of Sales and Catalogues" and the separate list of "Prices Brought" are of no practical use to the student of Aesopic literature.

It is to be regretted that Dr. Keidel has lavished so much labor to so little purpose. He seems to have printed the contents of his notebooks, and has produced a work of small value to students, and which, it is no exaggeration to say, might have been condensed into a dozen pages.

Sketches of Travel in Normandy and Maine. By Edward A. Freeman. With illustrations from drawings by the Author, and a preface by W. H. Hutton, B.D., Fellow and Tutor of St. John's College, Oxford. Macmillan. 1897. $2.50.

The historian Freeman was always greatly interested in geography, in topography, and in buildings, as, indeed, an historian ought to be. His possession of considerable means enabled him to travel much, and he used his journeys to excellent advantage by constant and close study of the localities in which his historical interest was centred. His many volumes of historical essays show this strong interest in ancient cities and in ancient structures, and, besides those, there are detached essays on purely architectural subjects, and several volumes devoted almost exclusively to towns and the buildings which compose them. 'Historical and Architectural Sketches, Chiefly Italian,' appeared in 1876, and 'Sketches from the Subject and the Neighbor-Lands of Venice' appeared in 1881, and now a third volume appears, uniform in size with the others, and worthy to be their companion. Each of the three volumes is illustrated by very singular drawings, unskilful quite beyond the power of words to express their unskilfulness; but also, we think, erroneous—exactly as a bad drawing of a flower or bush is erroneous—erroneous in the sense of giving a false idea of the object represented. Mr. Freeman always had the notion that a simple, straightforward, well-meant drawing of a piece of architecture ought to carry it with the student. That he had seen the building with his own eyes and had set down on paper just what he saw, was enough, he seems to have thought, to show to the reader also what he, the writer, had seen. How completely a bad drawing of a good building can misrepresent that building was unsuspected by him.

The same oversight, or error, marks the literary treatment of architecture in the books under consideration. Mr. Freeman is often mentioned as a writer on architecture whose words are of weight, but it must be stated plainly that these words are of weight only as suggestions as to date and origin, and that to the better informed student. Nowhere in Mr. Freeman's work is there any indication that he was interested in construction, or that he knew what construction was, or that architectural styles depend upon it; nor is architectural sculpture of interest to him except as he thinks, or fancies, that such and such a piece of carving must have been done at the order of some historical personage in whom, for the moment, he is interested. This architectural criticism is inconceivably insular, and he compares Continental work with English to the disadvantage of the former in a most amusing way. More than almost any other writer that we can name he misunderstands the artistic purpose in fine ancient buildings, and ignores the important to insist upon the trivial.

It is because long essays by Mr. Freeman are printed as prefatory or explanatory notices to plates from drawings by others, and because he is ranked seriously among writers on architecture, that it has seemed necessary to make these remarks. The book before us cannot be praised as a treatise on architecture. As an assistant to the guide-books, as an additional and fuller guide-book for the region which it covers, it must be praised and should be freely used, in spite of the extraordinary blunder on p. 204, where we are told that the great south spire of Chartres is modern and of iron, although "it very well reproduces the outline of the elder one of wood."

Papers and Notes on the Genesis of the Diamond. By the late Henry Carvill Lewis. Edited by Prof. T. G. Bonney. Longmans, Green & Co. 1897.

Abstracts of these interesting papers appeared about ten years ago, but a singularly unhappy fate has attended the production of the complete texts. The talented young geologist who wrote them, and whose work on the 'Glacial Geology of Great Britain' was reviewed in these columns in 1895, died in 1888, committing his manuscript to George H. Williams, whom also his colleagues have to lament. The manuscripts were then committed to Prof. Bonney.

In his preface the editor announces as Mr. Lewis's view of the genesis of the diamond that it is due to "the action of an extremely basic rock upon carbonaceous material." As the editor must have read the papers, and these are clear in their statements, one can only say that Mr. Bonney's representation is singularly misleading. Lewis never saw the Kimberley mines, but examined suites of specimens with most painstaking care, and his conclusions are in the main geologically correct. The mines are volcanic "necks," or the conduits of ancient volcanoes, filled for the most part with an igneous

breccia which arose from the breaking up of solid lava crusts in liquid lava. With the breccia are mingled fragments of wall rock. Much of the wall rock is a bituminous shale, and some geologists have ascribed the formation of the diamonds to the action of the igneous rock on this material. Not so Lewis, who wrote: "The diamonds are as much a part of the Kimberley rock as biotite, garnet, titanic and chromic iron, and perovskite, and, like these minerals, may be considered a rock ingredient." He also points to the abundance of minute, almost microscopic, crystals of black diamond as evidence that these were not enclosures brought up from some other matrix, such as gneiss or itacolumite. The shale, he truly says, is most plentiful near the top of the Kimberley mine, and less frequent in the deeper portions; while the diamonds "continue just as abundant, if not more so, the deeper the mines are explored." They are, according to Lewis, never found in, or especially associated with, the foreign inclusions; and this is correct. As to the origin of the carbon, Lewis does not commit himself.

Lewis went astray in his interpretation of the fractured diamonds of these deposits. Some of the gems go to pieces spontaneously after they have been extracted; these specimens have, as a rule, a peculiar brownish color, and are readily distinguished by experts. The cause of the disintegration is very probably included gas. The fragments of diamonds found in the rock itself are rarely if ever of this character, nor do they present any other peculiarity. They are in all respects comparable with the broken porphyritic crystals of other minerals which Lewis observed in the rock, and all these fractures are referable to the moment of explosive expulsion of the lava from its deep-seated source. Such fracturing is common in igneous rocks.

These papers give full attention to the mineralogical composition of the rock which Lewis named Kimberlite. It is chiefly composed of olivine and contains no feldspar. It closely resembles some stony meteorites. Similar rocks are found in the United States, but the diamond has been detected in its original matrix only in the South African deposits.

Year-Books of the Reign of King Edward the Third. Year XVI. (First Part). Edited and translated by Luke Owen Pike. London: Eyre & Spottiswoode. Pp. c, 338.

An interval of some five years and a half separates the publication of this volume and that of the Year-Books of 15 Edward III. The delay has not been the editor's fault, and we are now assured that the publication of these excellent volumes will proceed "not less rapidly, at any rate, than in earlier years." Not only is the thorough and scholarly method of editing, which Mr. Pike introduced, to be continued, but a Calendar of the Plea Rolls of the Common Bench is to be published, "including all the cases which reached final judgment or issue." This will be of great service to legal scholars.

Much the greater part of Mr. Pike's learned "Introduction" is devoted to the consideration of a case relating to a charter of Edward III. to the burgesses of Wells, and to the history of that borough. This has less interest for us than for English scholars; but still the students of the subject of corporations will find it valuable. "It was really about the reign of Edward III. . . . that the idea of the lay corporation, the lay *persona ficta* (as now understood), was painfully elaborated." Those who have visited the beautiful city of Wells will be interested in this passage: "They [the burgesses of Wells] had wished to have their town walled, embattled, and moated. A little before this time [1342] the Bishop of Bath and Wells (Ralph of Shrewsbury) had applied for a license to fortify his own palace with wall and battlements and turrets; and he succeeded where they failed. His battlements still remain, with a moat around them, as a monument of this memorable struggle of the fourteenth century."

At p. xxii Mr. Pike has an interesting passage on *peasants*, "a word which does not often occur in the Year-Books." A peasant, he says, is etymologically an inhabitant of the country (*pays* or *pais*). But a freeholder could not be a peasant; and so when an issue was to be tried by the country (*patria*, *pais*), the word *pais* did duty for a word (*patria*) with which it had no etymological connection; being itself derived from *pagus* or *pagensis*. And so an issue to be tried by the *pais* could not be tried by the *paisans*, because they were not free and lawful men.

At p. 290, the Latin record is preserved of a case involving the trial of a jury by an attaint jury of twenty-four. Three of the original jury were dead.

It is interesting to see the appearance in 1342 of names with which we are now familiar. The manors of Wassyntone and of Seggewyke, in Sussex, and the names of Henry de Walcote, Thomas de Musegrove, Thoms Doraunt, John Del Feld, Ranf de Bethum, or, as it is variously spelled, Bethun and Bethon (meaning Beetham in Westmorland), and Hugh de Chew, are among those which should interest many of our readers.

In a strictly legal point of view, this volume has less interest than most of its predecessors.

BOOKS OF THE WEEK.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.

Agents for Clubs, Libraries, and all private collectors.

187 Piccadilly, London, W.

TURKEY OF TO-DAY.

Impressions of Turkey During Twelve Years' Wanderings.

By Prof. W. M. Ramsay, author of "St. Paul, the Traveller," etc. Octavo, gilt top, $1 75.

"No conception of the real status of Turkey is possible unless something is understood of 'the interlacing and alternation of the separate and unblending races.' . . . Such an understanding is admirably presented in Prof. Ramsay's book, which gives a near and trustworthy insight into actual Turkish conditions."—[N. Y. Times.

"Most valuable and instructive. . . . The information presented is the result of twelve years' research and travel. . . . The volume must remain an authority in its subject matter."—[The Congregationalist.

ADDRESS

THE MACMILLAN COMPANY, 66 Fifth Ave., New York.

The Nation.

NEW YORK, THURSDAY, AUGUST 19, 1897.

The Week.

The action of the Ohio Silver Republicans in endorsing the Democratic State ticket has again set the Republicans appealing for the support of the Gold Democrats. Senator Hanna and Gov. Bushnell realize that it would be an uncommonly handy thing to have the Gold Democratic vote this November, as they had it last. But are they not a trifle late about making this discovery? Are they not, in fact, guilty of something very like impudence and indecency in now asking the aid of men whom they have improved their months of power to insult in speech and offend in legislation? It has been great fun for Hanna's man Grosvenor to sneer at Mugwumps and gird at civil-service reform; the party has had a fine time paying off its debts with the tariff and dodging currency reform; but it is sacred simplicity to turn around now and ask for the continued support of the very men who feel themselves flouted and betrayed. At the precise instant that Platt's newspaper is calling upon the Gold Democrats of New York to support Platt against Bryanism, Platt's Collector of the Port peremptorily dismisses from office the Gold Democrat who has been serving as cashier of the custom-house. This is neither magnificent nor is it war. The fact is that the course of the Republicans on the currency has been marked, since the election, by such vacillation and insincerity that they have lost all title to the support of Democrats devoted to the gold standard. Why should a new set of promises be trusted when the old was so shamelessly violated? No; the Gold Democrats in Ohio and all other States must run a ticket of their own, and avoid fresh betrayals. The question of what candidates for the Legislature should be supported will have to be settled in each district on its own merits.

One of the difficulties encountered by a "progressive" party is that of progressing in a uniform way. Some members of the party want to advance faster than others, and it is hard work to keep them together. The Ohio Populists seem to have been embarrassed by this difficulty in their recent convention. Some of them wanted to be conservative and consult expediency by combining with the Democrats. Others preferred devotion to principle above the allurements of success, and as they were in the majority they insisted that their comrades should fall into line. The controversy that followed was marked by fraternal freedom of speech. The hypocrisies of parliamentary procedure were discarded, and the opinions which politicians frequently hold of one another, but do not publicly proclaim, were on this occasion frankly expressed. The "Middle-of-the-Road" element accused their temporizing brethren of being paid by John R. McLean to favor fusion with the Democrats. The fusionists retorted that the advanced element was paid by Senator Hanna to nominate a straight Populist ticket, and they followed up the charge by producing a check for $25 signed by Major Dick, who is in charge of Senator Hanna's canvass. The holder of this check said it was given him for services to be rendered in defeating fusion, but he had abstained from cashing it because he wanted to use it as evidence that Major Dick was debauching Populists. The Rev. J. A. Taylor testified that Major Dick had given him a check for $25 for the same purpose, but that he had cashed it and spent the money. The discussion became so animated, and the charges of falsehood and corruption so plainly sincere and truthful, as to lead to personal assaults, and the police had to be called in to enable the delegates to make their imputations against one another audible. Finally the orthodox element prevailed, adopted a platform which is a logical development of that adopted by the Democrats at Chicago, and nominated "General" Coxey for Governor. The nominee for Judge of the Supreme Court very properly assured the convention that if he was elected, no injunction against anarchy or anything else should be issued. This is the class of people to which the Democratic party last year surrendered its organization.

A belated *Congressional Record* prints a belated speech of Congressman Grosvenor's on "Civil Service Run Mad." Some of the virus must have got into Grosvenor himself, for he has clear symptoms of rabies. He pictures civil-service reformers "fawning at the feet of power," and demanding that the President shall not appoint so much as a "messenger to guard the archives of his own executive office" without the consent of his "malignant enemies" of the Civil-Service Commission. This is running mad indeed, and no wonder that Grosvenor's fury rises as he contemplates the President, by his recent order extending the merit system, actually giving his malignant enemies still more power over appointments. Grosvenor forgives McKinley for this, but serves notice that at the coming session of Congress the whole nefarious law shall be cut up by the roots. His idea is one of masterly simplicity. Let Congressmen certify the fitness of candidates for office, and so do away with these cumbrous examinations which "smother the voice of the people." At the close of his speech, Grosvenor worked around slyly to his own district. He nobly avowed that it did not "lower his sense of personal dignity" to rally old and young and promise each an office; whatever may be the case with other Congressmen, he has not yet reached the point of "contempt for his constituents," but is, on the contrary, "always willing and anxious to aid them to secure the blessings and emoluments of the administration of the government." It is declared that this speech will make Grosvenor the "chief idol" of his Ohio partisans. It ought to. That was the object of its alleged delivery in Congress. Still, one would like to put a question to Grosvenor's constituents. He has no contempt for them; can they say as much for him?

The Kentucky Republicans in their State convention last week "reaffirmed" the national platform of last year, and endorsed the new tariff, which, with a cheerful confidence based on no known facts, they declare "will raise revenue sufficient to support the government and prevent the issue of interest-bearing bonds," as well as protect American labor. Nothing whatever was said in the resolutions about the currency question, although Senator Deboe, in his speech as temporary chairman, was not afraid to use the word gold, remarking that "the Republican party is in favor of a sound and safe financial system, and believes that this is best maintained by having gold as the standard of value." Among the principles set forth in last year's national platform which were reaffirmed was the statement that "we renew our repeated declarations that the civil-service law shall be thoroughly and honestly enforced and extended wherever practicable," but this did not prevent the adoption of the following protest against the whole system based on that law:

> "We are opposed to a system of civil service that builds up an official class of practically life tenure in almost all branches of the public service, and we demand that the civil service be so modified as to limit the terms of service to four years, with the privilege of reappointment or promotion, subject to such restrictions as will secure competent officials and to every section of the country its proper proportion of them."

In view of the fact that a Republican President has just extended the scope of the merit system by a new rule designed to insure greater permanence of tenure. this is a most extraordinary deliverance. It is practically a rebuke of Mr. McKinley for his recent order, and a proposal to undo his work.

The Dingley tariff bill went from the Senate to the conference committee on July 7. Although it was not finally reported and passed until July 24, importers reckoned on immediate enactment, and as a consequence the enormous rush of anticipative imports, which had continued since the opening of March, was practically ended by July. The foreign trade statement for that month, issued on Monday by the Bureau of Statistics, shows how sudden has been the resultant shrinkage in the country's merchandise importations. Last February, the total of these imports was $59,193,868, or less than those of February, 1896. In March the total rose to $76,372,831, in April to $101,305,131. Even in June it had fallen only to $84,826,110. In July, however, the record of the country's imports fell off $31,137,621 from the month preceding, and amounted to only $53,688,489, the smallest total since last January, and only a trifle over that of July, 1896, when import trade was almost at low ebb. For August the import movement has undoubtedly been smaller still; the average of foreign imports at New York, for instance, since the month began, has been fully $4,000,000 weekly under that of the month of July. If the same percentage of decrease has been maintained this month at other ports—and New York's trade is usually typical—the total August importations will be by far the smallest of any month in many years. Thus far in August, by the Treasury's official statements, customs receipts foot up $3,236,513, against $5,707,885 for the corresponding period of 1896. In other words, they are, under the Dingley tariff, less by 40 per cent. than they were under the Wilson tariff in one of the worst months of its history.

Since February, imported merchandise has exceeded exports by an average of $10,000,000 monthly; during April, the import excess rose to $23,579,431. It was largely settlement for these trade obligations which kept the New York sterling market high, and forced, even last month, the shipment of $5,460,000 gold in the face of the heavy European demand for grain. But the decreased importations in July have resulted in a merchandise export balance of $17,723,966. In August this excess of exports will increase enormously. Imports, as we have seen, have decreased rapidly, even from July; meantime, our shipments, of cereals especially, have risen to enormous figures. Last week this country sent out 4,460,519 bushels of wheat, against a weekly average, in July, of barely 2,200,000. Export of other farm products shows similar remarkable increase, and the gain over 1896 and 1895 is as heavy as the gain over preceding months this year. It is hardly a matter for surprise that this month's sterling exchange market, under such conditions, should have broken violently, and that imports of gold from Europe are already a topic of discussion.

One piece of knavery has been found in the Dingley tariff—that is, an unexpected piece. Opinions may differ as to the schedules which were discussed and understood, giving increased advantages and bounties to the rich, but in all such cases the action taken was known or might have been known by the Congressmen who voted for them. The extra 10 per cent. tax put upon goods passing through Canada was a downright swindle, because it was introduced by stealth. If its existence had been known or suspected it would have been strongly resisted by New England and by parts of the West which now enjoy the competition in freights which the Canadian Pacific and Grand Trunk railways give. It would have been defeated, as it had been defeated before when presented on its own merits. For this reason we call it downright knavery. And now the question has arisen whether another similar trick was not played with the bill by introducing the Sewall-Elkins provision for discriminating duties in favor of American ships—that is, imposing 10 per cent. extra duties on goods imported in foreign bottoms. This measure was identified with the name of Mr. Bryan's running mate, Sewall, who was nominated because he represented that scheme. The measure was introduced by Senator Elkins, but fell dead. It did not find any support in either branch of Congress, and it was opposed by the leading protectionist newspapers. That there was a design to work it into the Dingley bill by stealth is very evident. Whether it was successful or not is uncertain. The Treasury officials are inclined to think that the change introduced into the phraseology of the law was not sufficient to accomplish the end which was evidently aimed at, but Mr. A. R. Smith, who carried on Sewall's literary bureau during the last campaign, insists that the discriminating duty has been enacted. What a queer thought!

The Attorney-General is said to be giving much thought, before making his decision on the 10 per cent. discriminating duty on goods in bond coming through Canada, to the question what was "the intention of Congress." This is doubtless a consideration to be taken into account in interpreting an ordinary statute, but it is farcically beside the mark in construing any tariff law, especially such a swindling clause as the one in controversy, smuggled in as it was in conference and voted by both houses in the dark. Senator Hoar has declared that the Dingley bill as a whole was passed blindfold, the House not being trusted to so much as read it. This was certainly the case with the discriminating duty, which not one Congressman in ten knew anything about till it was sprung on the surprised public. For the Attorney-General now to reason gravely on what was "the apparent purpose of Congress" is a little too absurd. The men for him to apply to are the ones who had the clause inserted in the way that "Zekle crep' up, quite unbeknown." If these interested parties have got the Canadian Pacific down; if they have succeeded in secretly manipulating a federal statute so as to put money in their own pockets, let the Attorney-General say so and declare the law. It will be only one swindle more to charge up against the Dingley bill. But let us at least avoid the solemn nonsense of arguing what Congress intended by a law which it did not know it was passing.

Is Stewart among the prophets? And Jones? These eminent silverites are at least among the profits in Wall Street, and are talking in a way to make their constituents think they have been imbibing a great deal of prosperity, or something equally exhilarating. Such a fear will be particularly aroused by Senator Jones's remarks about Trusts. One result of the prosperity which he foresees, will be an "abeyance of this hatred of Trusts." Jones, for his part, proclaims that he never cherished "enmity towards combinations of capital." This has been suspected. It could be believed even of other Senators. But what Jones wants is that all the people should have the same kindly feelings towards Trusts which warm his bosom. They doubtless would if they had the same facilities as he and Stewart have for visiting Wall Street and, as the latter expresses it, just "going to sleep and getting rich." No wonder that Stewart says this is no time for pessimism. If the prince of pessimists gives it up, and admits that "there is nothing in talking silver at the present time," it is time for the little fellows to see that it is all up with the silver issue. Stewart contemplating with entire serenity the fall of silver to 25 cents an ounce and drawing the interest on his mortgages in gold; Jones solemnly announcing that he is not "opposed" to prosperity through good crops and an increase of gold—these are marvels to make one doubt if the age of miracles is really gone. The real significance of their conversion is, of course, their confession that the silver craze is nothing but a product of hard times. Crimes of '73 and conspiracies of the money-power and wrongs to silver and robberies of the people—all disappear like exhalations the moment good times return.

The renewed decline in the price of

silver is said to be causing much inconvenience in Mexico. The foreign exchanges are quite demoralized, and merchants hardly know how much to ask for the goods they sell or how much to pay for what they buy. The Government suffers, just as that of India formerly did. The amount of the public debt on which interest is payable in gold at London is about $110,000,000, but with silver at its present price this interest charge costs the Mexican Government probably over $13,000,000 a year in silver money. On the other hand, it costs only about $3,000,000 for interest on the internal debt, the principal of which is about $80,000,000. Still, the population of Mexico is not far from 13,000,000, and the revenue of the Government is some $47,000,000, so that no serious embarrassment is to be apprehended. The Mexican Government is not in the banking business, and has no promissory notes outstanding. The limited paper currency of the country is furnished by the banks, which appear from their reports to be substantial enough institutions. So far as the Government is concerned, it may have to apply a larger portion of its revenues to the purchase of exchange on London, but its revenues will probably be sufficiently elastic to meet the additional charge.

The fall in the price of silver affects the country as a whole more than it does the Government. Silver is by far the most important of Mexican exports. In the year 1895-'96, the value of the silver, silver ore, and silver coin exported was returned at over $56,000,000, which was considerably greater than the value of all other exports put together, including gold. The quantity of silver produced increases steadily and quite largely, but its purchasing power in the markets of the world is constantly diminishing. The fall in its price is no greater than other nations have witnessed in the case of some of their important products. Iron and copper are a great deal cheaper than they used to be, and so are many other things. But the present decline in silver comes at a time when general prices show a tendency to rise, and it is therefore a serious matter for the foreign trade of the Mexicans.

Consul-General Lee has made a report on the relief of distressed Americans in Cuba. It will be remembered that the President appealed to Congress on May 17 to pass an "immediate" appropriation of $50,000 for the purpose. There was great urgency, and the general impression was that much more money would be needed. But $50,000 would do to begin with, and Congress voted it in hot haste. Now, three months later, Gen. Lee reports that his first credit of $10,000 is "nearly exhausted." He has fed every distressed American he could find, and has furnished transportation to those wishing it. Of the whole number, 95 per cent. are naturalized Americans; most of them do not speak English and have never lived in the United States; many of them have never even been in the United States, being the wives and children of men who came to this country just long enough to be naturalized. Gen. Lee's report is thus an official exposure of the bunco game played on the President and Congress last May. By working hard for three months, the relievers have spent less than one-fifth of the sum which was "immediately" needed.

Kansas takes the equivalent of a State census every year, through the returns sent to the capital by the township assessors every summer. The showing just made is the most satisfactory for ten years. During nearly all of that period the State has been either losing population or barely holding its own. In 1888 there were 1,518,552 inhabitants, while in 1891 the number had sunk to 1,338,811. Slight gains in 1892 and 1893 were followed by losses in 1894 and 1895, the census in the latter year showing only 1,334,734. This was low-water mark, and last year the tide began to set the other way, the figures for 1896 being 1,336,659. This summer the current is seen to be running more swiftly, the population being now reported as 1,366,789. This is still far short of the figures eight or ten years ago, but it seems reasonable to expect that the gain will continue. The only serious obstacle in the way is the fact that Populism is in power, and cannot be ousted for some time.

The announcement that Mr. Low has become satisfied that he is the man who to the most people represents the idea of honest municipal government will not surprise the public, but it is none the less gratifying, because it assures the presentation of his name as that of the candidate who is to stand for the principle of good government in the approaching struggle for the mayoralty of Greater New York. Pending his nomination, it is amusing to observe the helpless air which characterizes the professional politicians of both parties as they see the people thrusting the "workers" aside and taking charge of the election. They have never known anything like this Low movement before, and they find it harder to understand, the further it is carried. At first they were going to laugh it down, but ridicule has failed, and they do not know what to try next. The shrewder men on the Republican side already see that there is no way of stemming the tide, and that the only thing for the "organization" to do is to accept the inevitable as gracefully as possible.

The assessors of Westchester County, N. Y.. appear to have adopted a rule of their own for arriving at the value of real estate. They say that they ascertained, as well as they could, the price paid for each piece of property, and then added thereto whatever had been expended for improvements. They claim to have increased assessments from a desire to comply with the law; but the law contains nothing to warrant assessments made on any such principle as they have adopted. It requires them to assess property at its fair value, and the amount that has been expended upon real estate has very little relation to its fair value. That value is indicated by the market price. Land that is productive of revenue sells at a figure proportioned to the revenue. Land that is unproductive sells according to its attractiveness for purposes of residence. When such land is sold, the purchaser seldom pays much attention to the amount of money that previous occupants have expended. He generally thinks that in many ways they spent their money foolishly, and proceeds to spend his money in undoing their work. The value of the property may thus be correspondingly increased to him, but it is seldom correspondingly increased to any one else. The fair value of land for purposes of taxation is not what it has cost, or what the owner would take for it, but what in the ordinary course of business men would be found willing to give. To assess property at a higher rate than this deserves indictment at least as much as to assess it for less.

It is a great thing to have the honor of the Italian troops in Abyssinia so clearly vindicated. Yet it hung on how small a thread! If the Count of Turin's foot had slipped, or if his sword-hand had been disabled instead of merely scratched, the world would have had to believe that the Italian soldiers are thieves and cowards. But now, that wound in the subcutaneous tissue of Prince Henry's abdomen proves conclusively that they are not. No wonder there was great rejoicing in Rome. The national reputation has been cleared by one thrust in a foreign abdomen. This answers all questions as to what the facts are. Facts, just look at that wound! Schopenhauer lavished his mordant sarcasm on the duel as a means of moral and legal proof of innocence or guilt, but even Schopenhauer would find it hard to do justice to the extravagant features—the absurdity, the *réclame*, the immense journalistic exaggeration—of the Sunday's duel in France between two royal self-advertisers. But, seriously, the incident is a deplorable aggravation of the international ill-feeling which has been deepening for twenty years, fostered by the press of both countries, and finding expression in tariff hostilities and in brutal mobbings.

BANKING REFORM.

In the latest publication of the Gold Standard Defence Association of Great Britain, Mr. B. E. Walker of Toronto discusses the banking system of Canada and incidentally that of the United States. The paper is only an eight-page leaflet, yet it embodies all that is needful to Mr. Walker's purpose, which is to explain why there is no silver party in Canada, and no agitation for free coinage and "cheap money." The reason is a very simple one. Canada has a good banking system. The loanable capital of the country, and its loanable credit, be the same more or less, are equally available in all parts of the Dominion at all times. There is no surfeit at the commercial centres and simultaneous scarcity at the small towns. That phenomenon is avoided by the system of branch banking which prevails in Canada, whereby the reserves of the banks are made available at all points where branches exist, just as the water in a reservoir finds its way to all the pipes and small tanks connected with it. "The agitation in the United States in favor of the unlimited coinage of silver," says Mr. Walker, "is simply the form in which the discontent with existing conditions is expressed by those who do not understand currency and banking problems."

Mr. Walker has here told a truth, but there is something more to be said about the agitation. It is largely based on the collapse of speculation which took place in the years immediately following the Baring panic in London. This occurred in 1890. It disturbed the whole financial world. It shook the fabric of inflated values in South America, Australia, and the United States. It brought on liquidations in all those countries as well as in England. It happened to coincide with a fatal step in the United States—the Sherman act of 1890. That ill-starred measure was passed, not to make money plenty—there was no scarcity of money then—but to insure the passage of the McKinley tariff. It was one of the "political dodges" of which our financial legislation during the past twenty years presents many instances. It was perhaps the worst of all of them. It came at a time of all others when careful, conservative action was needed. It created distrust among capitalists at home and abroad, and it played into the hands of the speculators, enabling them to float more securities and sell more town lots on the prairies, on which the purchasers made only the first payment, about enough to defray the cost of surveying and "staking out" the phantom cities. It promised more money, but it really made less, since it sent gold out of the country and filled the circulation with a new kind of moonshine currency that all men of sense distrusted.

The collapse of 1893 was the consequence. When it came, the speculators of all degrees said that there was not money enough, and the demagogues took their cue from that text. There was not enough money for them, and there never could be enough, because their schemes required more and more in ever-increasing volume. The only safety was in stopping the source of inflation. The country recognized that fact and applied the only possible remedy—the unconditional repeal of the Sherman act. The card-house of speculation was bound to fall. It had really fallen before the act was repealed, but, as in all such cases, the speculators deluded themselves with the belief that the trouble was a lack of money. So they took up the free-coinage issue. The demagogue politicians "caught on" and the campaign of 1896 followed.

While it is true, therefore, as Mr. Walker says, that the demand for free silver was an expression of discontent with existing conditions, that is not the whole truth. On the other hand, it is undoubtedly true that the lack of facilities such as exist in Canada, in Scotland, and in most countries of Europe for the prompt distribution of banking capital and banking credit has been, and still is, an aggravating circumstance. It is true also, we think, that if our banking system were assimilated to those of Canada and Scotland the free-coinage men would not have much ground to stand on. They are losing ground pretty fast now; they would collapse completely if the mobility of capital and credit were as well provided for among us as it is among our neighbors on the north. This mobility is secured in two ways; first, by the branch banks, and second, by the issue of notes against the bank's general assets instead of special security deposited with the Government. Both these reforms will come in time, but perhaps not until the end of some new financial convulsion. The temper of Congress at present is against banks without regard to circumstances. This is shown by the fact that so simple and unobjectionable a measure as allowing the national banks to issue notes up to the par value of their security bonds cannot be passed. It is a paradox, but it is true, that in bad times when we need banking reform we cannot get it, because the banks are held responsible for the bad times. Let us hope that when good times come, when the pressure is removed, there may be a relaxation of the unfounded prejudice against banks, which blocks all movements to make them better. When that time comes it is most probable that reform will follow the lines indicated by Mr. Walker, *i. e.*, branch banks and note issues against general assets, coupled with such security as experience has shown to be needful to protect the noteholder against loss.

OUR MACHIAVELLIANISM.

Mr. Frederick Greenwood, in a striking article in the August *Cosmopolis*, characterizes John Morley's recent Romanes lecture on Machiavelli as "the most stirring political pamphlet that has dropped from the English press for many a year." The reason why this academic lecture really turns out to be a tract for the times is that Machiavelli and Machiavellianism are just now enjoying a sustained reaction in their favor. Party politics, as Sir Henry Maine pointed out, always embodies some of the worst political faults attributed to Machiavelli; but it is now "in the rising conflict of nations for commerce and for empire" that "the returning influence of Machiavellian precept is to be dreaded." Of course Machiavelli remains, as Macaulay said he was, in the popular conception, the discoverer of ambition and revenge and the original inventor of perjury; but for his fatal 'Prince,' we should never have heard of a hypocrite, a traitor, or a tyrant in public life. But if we damn his person only to follow his doctrine, we but emphasize his triumph; our very hypocrisy proves him right.

If Machiavellianism may be conveniently summarized as the justification of deceit and fraud in statesmanship, the assertion of "reasons of state" over morality, of brute force over humanity, it is not difficult, as Mr. Greenwood truly says, to show that the nineteenth century in England is in no position to hold up its hands in horror at the sixteenth century in Italy.

> "The coarser corruptions in old countries have been nearly extinguished, leaving only the finer; and there are no coarse crimes in high places. Yet, if Machiavelli could review with that illuminating eye of his our treatment of the bad black man Lobengula, and the Rhodesian plot, and those other more delicate matters which Mr. Morley's warning against hypocrisy started me upon, he might say: 'I see that I spoke truly. Men may change their garb, their aspect, their language, the scene and scope of their activities, but human nature remains the same.'"

It would be pleasant to dwell upon Mr. Greenwood's account of Machiavelli in modern English politics; the vices as well as the misfortunes of our friends it is always edifying to contemplate. But it may be more profitable, if also more ungracious, to ask at what points the political maxims of the great Italian are establishing their hold on our own political life. In domestic affairs, the danger might appear to be reduced to a minimum. The sixteenth-century Prince had his own subjects to conspire against as well as foreign enemies to plot to ruin; citizens of the state were to be tricked and cheated and lied to and despoiled for "reasons of state." All that, in its crude form, has passed away. Government is no longer a separate power intriguing against its own people—though it is still common enough to see one set of people taking possession of it

and using it to intrigue against another set. But we have only to read party for Prince to see that the rules of conduct which Machiavelli laid down for the Prince are threatening to become practically the working principles of party.

The Prince was under no obligation to tell the truth; neither is the party leader. To make matters easy for himself, to secure ample revenues, to maintain his army, to appease discontent and quell insurrection, the Prince was justified in resorting to any kind of deceit or treachery or force. Who will say that the same thing is not now substantially true of party politics in an emergency? What else is involved, in the last analysis, in the favorite excuse, which is also the condemnation, of public men, that they "must support their party"? It simply means that considerations of morals must give way to considerations of party. That is Machiavellianism. The last tariff bill is the last instance of its working. A bill of false pretences and of jobs and swindles innumerable, it owed its enactment to the votes of men who bitterly denounced many of its features, and who were thoroughly convinced of its impolicy and injustice, yet who sacrificed their convictions and their constituents to the demands of party. Machiavelli would have approved this.

But it is true of us, as it is, according to Mr. Greenwood, of England, that the greatest temptation to adopt the methods of the Prince is in foreign policy. There we instinctively feel ourselves freed from some of the restraints which we recognize in domestic policy. The real reason is that we practically identify the conduct of foreign relations with the conduct of a foreign war. In war everything is fair. But in the fierce struggle for trade and territory, preliminary negotiations are practically the beginning of war; therefore, everything in them, too, is fair. If it is right to trick an avowed enemy in every way; to mislead him as to your intentions; to show false lights; to give him lying information; to plot and plan in every way to trap and defeat him; why, so it is to do the same things to one who may become your enemy. It is only adopting the methods of war before the declaration of war. On no other ground can we account for some of the extraordinary positions taken by our Government in recent years. The easy disregard of treaties; the rash charges of oppression and bad faith flung about at other countries; the blind reaching out for territory without regard to the rights or fate of those who live on it—all these are Machiavellian characteristics and policies.

And they are defended by Machiavellian arguments. The Prince was to hesitate at no means necessary to his own self-defence or the growth of his power along with that of his rivals; instead of Prince, we say "state" or "nation," and allege the same justification. Things that are "necessary" for us we must do, whether right or wrong, just or unjust, merciful or inhuman. We do not know exactly how the Japanese and Chinese and Portuguese in the Hawaiian Islands will fare after annexation—it looks as if they would have a bad time of it; we are sorry for that, but of course we must have the islands. They are necessary to self-preservation. The "state" demands it, and the individual must not complain. But what really is this "state" of the Jingoes? Charles Buller said, when the Canadians in their troubles of 1837 were exhorted to trust "the mother country," that the mother country was really an old gentleman with a white cotton umbrella getting off an omnibus every morning in Downing Street. In like manner we should find, we fear, if we closely scrutinized the "state" which the Jingoes propose to make responsible, in some transcendental way, for all their cruel tender mercies to Japanese and Hawaiian, Cuban and Samoan, that it resolves itself into a group of scheming politicians, planters and traders not too scrupulous, eager and ambitious naval officers and naval contractors. They are our modern Machiavellis, and it is their growing control of our foreign policy which threatens to undo all that has been done to civilize it, to make it rational, moral, and humane.

STATE INSURANCE.

The proposed federal Australian state is to be, like ours, a government of enumerated powers; and in the draft now under discussion among the colonies, "State Insurance" is one of the proposed powers. This is, we believe, the first proposal of the kind ever made by the drafters of a written constitution, and is, therefore, of considerable importance. It is significant of the vague ideas which prevail on this subject that there is in the instrument no definition of what state insurance is, to what subjects it is to be applied, nor under what conditions. Yet this question lies at the very threshold of the matter. The grant of power might mean that the state was empowered to take over all the business now done by insurance companies, collect the premiums, and pay the losses; there is nothing absolutely revolutionary in such a scheme, yet we doubt if it is contemplated. On the other hand, one of the English colonies now carries on a business in land-titles which is almost identical in its effects with the business of the title-insurance companies as carried on in this country. Practically it guarantees every landholder against flaws in his title, receiving in return small fees from all landholders, which form a fund to indemnify adverse claimants. This system, which is very likely destined to spread over the world, is a very good illustration of a proper Government insurance business, all titles to property being a Government output, just as much as cutlery or matches are the product of private enterprise.

When it comes to the insurance of lives, or houses, or goods, however, the case is very different, and though it is perfectly conceivable that the State of New York, for instance, should expropriate and carry on the Equitable Company, nobody has, we believe, as yet seriously entertained the idea as a practical one. It is not quite like the idea of taking over the railroads, because in many states railroads are actually state property, and railroads are unquestionably public highways. It is a long way from state railways to general state insurance.

State insurance must, on the other hand, be distinguished from such schemes as the English compensation bill, designed to afford employees or servants pecuniary redress against accidents. This bill saddles the charge upon the employer, and not upon the state, and on this ground was very ingeniously defended by Lord Salisbury in the House of Lords the other day. What, he said, socialistic? Not a bit of it. This is a good, conservative measure, for it saddles the responsibility for the accidents in a mine or a factory upon the capitalist who gets the profit. It is in reality, he added, the present system which is socialistic. If a coal mine now explodes, and a number of miners are crippled and in consequence become destitute, they have to be supported by the parish—that is, the community at large—who have nothing to do with the matter, while under this good old-fashioned Tory measure the loss falls on the shoulders of the very man who set the miners at work, and but for whom, consequently, the accident would never have happened. Who can "ask fairer" than that?

This argument, of course, ignores the fact that the mine-owner may reply: "I did not cause the accident any more than you did. The cause of the accident was some carelessness, against which I took every imaginable precaution, and which, very likely, if the truth were known, was simply the recklessness of these very miners. If the courts say that I have been negligent, I am perfectly willing to pay; but to make me pay for accidents which I did my utmost to prevent, violates the first principles of justice." Into the merits of this argument it is not necessary to enter here; what we desire to point out is that Lord Salisbury is perfectly right in insisting that all poor-laws and taxes raised for the purpose of providing for the destitute and helpless may by Socialists be treated as a species of state or commu-

nity insurance, which has come down to us from the most remote times—though based originally on principles very different from those of modern socialism.

The question which is agitating the brains of Radicals and Utopians in Australia and elsewhere is, Why should not this system, under which the poor, halt, lame, and blind are supported at the public expense, be extended to cover a multitude of other cases? But they are generally careful to avoid saying how many cases they would have it cover. One pleasant sort of insurance they recommend is "old-age pensions," and to our mind the argument for some such system is, if we admit the premises, most powerful. Old age is not merely a risk, but a certainty of life. It comes to all alike, and it puts a stop at a certain period to self-support. It is nobody's fault, and responsibility cannot be fastened upon the parents who, through having brought us into the world, are really the cause of the whole trouble, for they have already escaped liability by dying themselves. Why should not the state insure us against it, and pay us all a reasonable weekly allowance when we reach the age of, say, sixty-five? It may be said that most people do not need it, but this is a total mistake. Outside the very rich, the number of people in the world who in their declining years can have all the comforts they need is very small. Then there is death. This is a certain evil, too, the effects of which fall in most cases upon the most innocent and deserving class in the community, children left without parents' support. In ninety-nine cases out of a hundred such children are brought up by their aunts, uncles, and grandmothers. Should not the state insure aunts, uncles, and grandmothers in some way against this burden? In Germany there is a system of insurance under which house servants are guaranteed against losses through illness, but in this case, as in the English compensation bill, the tax falls on the employer, and it is said that he deducts it from their wages—a result that could never have been intended.

These are merely specimens of the questions which must suggest themselves to any one who carefully considers the question of state insurance. The one thing clear about it is that, unless defined and limited, it must prove a socialistic wedge. When you have once adopted the principle that the community at large should be taxed to guarantee all the members of the community against losses, why should not all risks be covered, and the state guarantee every man a living, insuring not merely against old age and death, and fire and accidents, but against drought and flood, and disease, and crime, and vice, and idleness, and those inherent defects of character—dulness, want of "push" and energy—which so sadly handicap many of us? The scheme is more practical than that introduced by Bellamy in "The Republic of the Golden Rule."

FREDERIC DE FOREST ALLEN.

Hardly has the news of Prof. Lane's death become known to scholars when they are again shocked and grieved by the sudden demise of his friend and colleague Allen, professor of classical philology in Harvard University. He started from Cambridge on Wednesday morning, August 4, to join his family. He was in the best of health and intending to make the journey upon the wheel. From whatever cause, possibly from unconscious over-exertion in the heat, a blood-vessel was ruptured and death ensued in the evening. Prof. Allen's life-work did not bring him much before the public eye—indeed, he was not widely known even to the undergraduate community at Harvard; yet his loss is a great one, not only to the University, but also to the cause of classical scholarship in America.

Mr. Allen was born at Oberlin, O., May 25, 1844, when the college had just completed the first decade of its existence; and he came of the frugal and sturdy New England stock that early peopled the lands of the "Western Reserve." His father, George Nelson Allen, from Mansfield, Mass., was a pioneer at Oberlin, both as student and as preceptor; for he was a member of the second class (of 1838) to be graduated at the new college, and was professor of natural history there from 1847 to 1871. Maintaining an exchange of specimens with Agassiz and others, he made the beginning of a museum which is now an important and creditable one. The mother, Mary Rudd, was from eastern Connecticut, and a graduate (in 1841), with two other women, of the first college class in the United States in which women took a full classical course. Her interest in the language of the ancients she kept to the end, and read the Greek papers which her son sent her during his year of service in Athens.

Allen graduated in 1863 at Oberlin, and, after a course of study at Leipzig and some years of service as professor in the University of Tennessee, as tutor at Harvard, and as professor in the University of Cincinnati, was called in 1879 to the chair of Greek at Yale, to be the successor of those eminent scholars, Woolsey and Hadley. Here, however, he remained only a single year; for in 1880 the Harvard Corporation, mainly in order "to strengthen and enrich the department of graduate instruction," called three new professors simultaneously: Toy for Semitic languages, Allen for classical philology, and Lanman for Sanskrit. This was done under the conviction "that the prestige of the University was to be maintained and its influence increased quite as much by amplifying the highest instruction, which is necessarily given to a few, as by improving the lower, which is sought by many." Allen's senior colleagues in the classical department were Sophocles (already advanced in years), Lane, Goodwin, and Greenough; and the graduate department of the University was in its beginnings. There, then, for seventeen years he has labored, and has been cut off untimely in the midst of his work.

His first noteworthy publication, the first fruits of his Leipzig studies, was a treatise *de dialecto Locrensium*. It is a beautifully finished essay, lucid and attractive; and its substantial merit was rated high by his teacher, the first authority of the time, Georg Curtius, who published it in the third volume of his 'Studien.' While at Cincinnati he published an edition of the "Medea" of Euripides; and at Yale, a volume of 'Remnants of Early Latin,' which elicited high praise from the best judges. His next important work was a revision of Hadley's 'Greek Grammar,' finished in 1884; and the year 1885-'86 he spent as Director of the American School of Classical Studies at Athens. In 1888 he put forth an elaborate technical treatise on 'Greek Versification in Inscriptions' in the Papers of the School, on whose publication committee he was an active worker. Meantime, the "Harvard Studies in Classical Philology" had been undertaken; and in this enterprise, too, he bore his full part, aiding it by learned contributions, by editorial help, and by the best of counsel.

Mr. Allen was a man of genuine modesty. He was not at all eager to rush into print; he was much more concerned to have his work good, accurate, and usable, well digested in substance, and well finished in form. His published writings, accordingly, are not voluminous. On the other hand, there is every reason to believe, in his case, as in that of the lamented Hadley, that if his life had been spared one decade more, that decade would have been one of great and most valuable productivity. His sabbatical year of 1891-'92 he spent at Oxford and Paris in diligent labor on the glosses and scholia to Plato; and he has left a mass of material upon this subject, in part excerpts from the "Parisinus A," in part notes relating to the scholia of the "Clarkianus" of the Bodleian. And he was hoping, at the next opportunity, to proceed to Vienna and continue this work. In connection with his university lectures he had already made important preparatory studies and collections for a systematic treatment of the Greek religion; and this, it is likely, would have been one of his next undertakings.

He was an honored member of the American Philological Association, at one time its President, and a valued and frequent contributor to its Transactions. He was one of a little circle of friends, with neither organization nor name, but usually known as the History of Religions Club; and to it he brought his thoughtful and instructive discussions of topics of the Greek religion. His resources for diversion were not mean. He took an active and official part in the work of the Appalachian Mountain Club; he was an expert photographer; and his inherited taste and fondness for music made that a great solace to him. With one of his colleagues, by way of pastime, he wrote an operetta, "Old King Cole," and a musical pantomime, "Violetta." When the Latin play, the "Phormio" of Terence, was brought out at Harvard, he wrote the music, which was at once interesting for its fidelity to the spirit of the antique, and charming and graceful in itself.

It was only a very few days before his death that one of his colleagues who knew him well said to another, "How Allen continues to grow!" That was very true. The achievements of the "bright young man" are good; but the element of time is some-

thing in lieu of which no native gifts can stand. Time makes the ungifted man an old fogy. Time was making—had made—of Allen a ripe scholar. Indeed, there was something about him to remind one of the famous old Dutch Hellenists, whom he knew so well and admired so much. Like theirs, his conception of classical antiquity was many-sided; his reading was wide; and his sympathetic interest in kindred subjects (let us say comparative grammar or American dialects) which lay without his special field, was so genuine that his judgments were not easily perverted by giving undue weight to a single kind of evidence. To those who knew Prof. Lane, it is no small praise to say that he set store by Allen's decisions.

And how is it with the fragmentariness of such a life? *Voll Müh' und eitel Stückwerk*, says Goethe of human achievement. But it is vain and fragmentary only as we take it out of relation to what goes before and after. Charles Eliot has just passed away at even less than forty; and yet how complete and distinct is the service of public beneficence which he has rendered in beautifying the region about Boston, and in teaching men to work with nature and to love nature. And Allen has made a complete and distinct contribution to the building of a university. The distinctness of these services may merge as the years run. Future generations may know not whom they have to thank for the opportunity of nobler and more beautiful lives on the one hand, nor for the fundamental traditions of honest and ennobling scholarship on the other. But that need not daunt one's courage for a like high-minded devotion, nor abate one whit from our sense of the completeness and worth of such loving service.

A STATE OF SUMMER RESORTS.

BRUNSWICK, August 7, 1897.

It is now a generation and more since a considerable stream of travel began to pour itself, during the summer season, into the western and southern parts of the State of Maine. Beginning in a moderate way—a few families here, a party of sportsmen or tourists there—the number of summer visitors and residents has grown steadily, until it now reaches several hundred thousand annually; and the increase has been especially rapid in the past ten years. Although the regular summer population is drawn chiefly from the New England and Middle States and Canada, nearly every State in the Union is represented. Of tourists, strictly so called, the number is probably less than in some other places, quite the larger proportion of summer visitors being regular sojourners and their friends. In its size and character, however, as well as in its growing volume, the summer population marks Maine as unquestionably the chief summer resort of the Atlantic Coast, and of the United States as well.

The movement of this temporary population is mainly along three routes, or, rather, into three sections of the State. Fishing parties gravitate towards the Rangeley Lakes, and hunting parties towards Moosehead, while most of those who aim to combine pleasure and sport in about equal proportions commonly make one or the other of these places their starting-point. There is royal salmon-fishing on the Penobscot, and both fishing and hunting in the wild region further north, but the number of sportsmen who visit either of these localities is small as compared with the number who flock to the lakes. The other route is along the seashore, with Mount Desert as the terminus. From Kittery Point to Bar Harbor almost every mile of the coast has some of the marks of a summer resort, although Old Orchard, Cape Elizabeth, and Casco and Penobscot Bays catch and hold the greater part of the tide. Beyond Bar Harbor the summer population is inappreciable—partly, no doubt, because both coast and interior are here less beautiful than is the case further south, and partly because the region is not yet easily accessible. Along the New Hampshire line the influx, while increasing, is not yet very considerable, and is more in the nature of an overflow from the crowded resorts of the White Mountains than an appropriation of a new and distinct locality.

In circumstances, character, and aims the summer population of Maine presents the greatest variety. There are representatives of almost every type, from the excursionist and "globe-trotter" to the regular visitor of many years' standing, from the family of narrow means to the Crœsus whose thousands are scattered without a thought. Sportsmen, as has been said, seek the lakes, and with them goes a small army of less noticeable and less wealthy persons, both men and women, who push their canoes far into the unbroken forest, along the streams and lakes which carry one up to the Canadian and New Brunswick border. Those who go inland seem, as a rule, to eschew the sea, and vice versa; so that along the coast one finds a summer population which cares little for rod or gun, but takes its pleasure in sailing and salt-water fishing. Life in the woods represents the acme of the *négligé;* at the seashore resorts, on the contrary, with their large hotels and greater opportunity for display, the demands of fashion are heavier, and one dresses for dinner. Old Orchard, notwithstanding its magnificent beach, has changed much in twenty years; it is no longer fashionable nor even attractive, but is given over to gigantic excursions, Salvation Army conclaves, and "faith-healing." A large number of Canadians, however, still regularly pass the summer there, and a few remoter parts of the town have escaped, thus far, the barbarian invasion. For the most lavish show of wealth and the fullest fury of the social whirl one turns, of course, to Bar Harbor; but Bar Harbor is a little world by itself, and, notwithstanding its superb beauty, has long since become impossible for all save the financially elect. Finally, scattered over the entire settled portion of the State are thousands of summer visitors, representing almost every calling and condition in life, and attracted, some by family associations, some by the charm of a particular locality, some by the inexpensiveness of living. From June to September there is an endless succession of "summer people" on every train, steamboat, and stage, and at every hotel and boarding-house in Maine.

Of all modern devices for giving pleasure to large numbers of people, few have failed more conspicuously than the average summer hotel. In this respect Maine is no more fortunate than other States. While the situation of the hotels is often extremely attractive, the houses themselves are too often cheaply built and poorly kept, the ruling principle seeming to be the maximum of price for the minimum of endurable accommodation. So far, indeed, have poor service and exorbitant charges been carried at Bar Harbor that many influential cottagers have refused to recommend certain hotels to their friends; and there are said to be signs that the resulting loss of patronage is hastening the coming of much-needed reforms. Moreover, such beauty of situation as many of the seashore hotels originally possessed is being rapidly destroyed, in many cases, by the multiplication and crowding of small and unsightly wooden buildings. If, in this particular, matters go on for ten years more as they are going now, there will be very few large hotels at any populous resort on the Maine coast which persons with a feeling for natural beauty will care to patronize. Summer cottages of the better sort are multiplying, but not rapidly, while the innumerable ones of a lower grade are, ordinarily, little better than rough shells, destitute of every modern convenience. Away from the coast, save at Rangeley, Moosehead, and Poland Springs, the hotels are usually less pretentious, and provide comfortably for their guests. Transportation facilities for the principal resorts are good, although local railroad fares are very high; but the stage lines, which must often be resorted to, have so deteriorated of late years that travel over them is, in most cases, an experience to be dreaded.

The social effect of the large and rapidly increasing temporary population—in number nearly equal to one-third of the total permanent population of the State—is a question of considerable importance, though, naturally, one to which a very definite answer cannot well be given. The majority of summer visitors, of course, come and go without making any marked impression upon the community; but since they spend a good deal of money, they are more or less cordially welcomed. I am inclined to think, however, that anything like a general recognition of the social worth of the summer element is not yet very pronounced. Most communities in Maine are small, with many rural habits and characteristics, but little wealth. As a whole, the disposition to provide especially for the needs or desires of visitors is not strong, even where the chief part of the income is derived from that class; the assumption seems to be, rather, that the visitors are sure to come anyway, and that the less there is expended for their gratification, the greater will be the profit from despoiling them. There are notable exceptions, of course—communities which have been wise enough to spend liberally for their guests, and have reaped a rich reward, not of money alone, but of good-will and social enrichment. In not a few places, also, summer residents have contributed liberally to local public objects. The State authorities, too, are making, in the interest of sportsmen, energetic efforts to preserve the game, and have put in operation this year a novel system of licensing guides. Outside of transportation interests, however, a few energetic communities and select resorts, and, in fish and game matters, the State itself, the summer visitor in Maine is commonly looked upon as primarily a source of financial profit, and, consequently, a most desirable addition to the town or village, but, in other respects, as a person to whom the community is under no special obligation, for whose satisfaction no very strenuous ef-

forts are to be put forth, and from whom little can be learned.

To people generally, the financial side of the question is probably of most practical importance. That a very large amount of money is expended annually in the State by non-residents is evident; and, while the amount can hardly be determined with precision, it is undoubtedly much greater than most persons suppose. In 1893 the Commissioner of Industrial and Labor Statistics estimated "the pecuniary results to the State" from its summer-resort business at not less than $10,000,000 annually. The figure seems enormous, yet some good judges pronounced the estimate too small. Of this total it was estimated that $3,000,000 was spent at hotels and boarding-houses, $1,000,000 for farm produce, and $100,000 for services of guides. Each of these items would now have to be considerably increased. Taking communities as a whole, the receipts from summer business are very evenly distributed, and represent the necessaries rather than the luxuries of life; for, with the exception of Bar Harbor, it should be remembered, there is little expenditure that can be called lavish, most of the summer visitors being persons of moderate means, who seek vacations without display.

The future of Maine as a summer resort is a matter of vital consequence to the people of the State. There can be no question that the summer-resort business is already nearly, if not quite, the leading industry in Maine; and there seems to be good reason for thinking that its rank, in this respect, will be maintained for a long time to come. Two-thirds of the area of the State is still comparatively unsettled; the thickly settled portion, and the resort of most of the summer population, lies to the south and west, south of a line drawn from Machias to Lake Umbagog. The great region to the north, though holding in some sections, as in parts of the Aroostook county, a considerable population, is still, in the main, a land of forests, lakes, and streams. Its development waits upon the railroad; for, next to natural beauty and resource, it is the railroad that makes a summer resort. Railroad facilities, however, both in mileage and in equipment, are increasing. In the southern and western sections summer visitors have become an established institution. They have appropriated about all the choice spots on the coast as far east as Mount Desert; desirable building sites are already scarce, and command a good price. About the fishing grounds, too, land is being rapidly bought up, and permanent camps established; for here, as by the sea, pleasure and sport are unmistakably tending to become practicable only for the well-to-do. In the country, away from the shore and the lakes, signs of change are less in evidence; yet, here again, old farms are being rejuvenated, old houses made over, cottages erected at vantage points. Other indirect results of a practical nature are an increased attention to market gardening, extension of electric railroads, and a growing demand for good country roads. In these various respects, at least, summer business has brought prosperity. It seems inevitable, however, that the near future must witness a sharp advance in the cost of living, and that the reign of low prices, which heretofore has drawn many to the State, cannot long continue; indeed, this result has already, in some measure and in some localities, begun to come about. Such a social transformation will not, of course, work itself out rapidly, and some of its consequences are hardly to be deplored. Year by year, however, the pressure of summer population is forcing the advance line further and further into the forest, and eastward along the coast; and so long as two-thirds of the State, unlimited in resources, is yet unexploited, Maine is likely to remain, beyond dispute, the pleasure-ground *par excellence* of the United States.

WILLIAM MACDONALD.

ITALY AS A "GREAT POWER."

NAPLES, June, 1897.

Returning, last autumn, after twenty-five years, to Italy, I found, as I hardly need say, great changes, some already completed and some still in progress, both in the material and in the moral conditions of the country; but nothing more forcibly claimed my attention than the processes of evolution now going on in its political life. Chief among these in interest and importance is the extremely slow process of national unification; in other words, the gradual prevalence, among the inhabitants of the several provinces of Italy, of whatever makes them Italians over whatever makes them Sicilians, Tuscans, Ligurians, or Venetians, and the substitution, I might almost say, of a national for a sectional consciousness. I had left Italy when she had just completed her territorial unity by the occupation of Rome; I returned to find her still laboriously busy with the realization of a true national unity; and although Italy to-day sums up more visibly than any other European country the transitional character of the present half-century in every branch of human activity, this fact did not so strongly impress me in any other department of the national life as it did in this gradual melting together of so many distinct nationalities and of so many distinct types of men into one nation. The reader may be surprised that I should speak, in this connection, of distinct types of men; but the expression is justified by the facts. There is a greater difference between a Lombard and a Sicilian than between a Sicilian and a native of Provence.

When, long ago, Prince Metternich declared that "Italy" was nothing more than a geographical expression, he spoke the simple truth; and this it was that made his bare statement sting more sharply than the keenest epigram. There was no Italy in Metternich's day; and, what is more, though this is so absolutely ignored alike by Italians and by foreigners, there never had been any Italy. In the remote past there had been a Rome, a vast empire in which the northern Italian counted less as a citizen than the Allobrogian of Gaul or the Romanized Iberian of Spain. Since the disintegration of the Roman Empire, Italy had never been anything but a fortuitous collection of political units jostled together, singly or in ever-changing groups, in ceaseless rivalries and hostilities. Not even Dante had dreamed of an Italy at once united and independent; nor could one say that such an ideal had been cherished by any considerable body of Italians in any age before the French Revolution, that great wonder-worker to which the world owes the bewildering rapidity of its progress in this century of speed.

As late as 1891 the Italian novelist De Roberto could, without in any way violating the probabilities of fiction, make an old *marchese* in his famous novel 'Illusione' say of Italy, "Do you call it a nation? Why, it is a mere harlequin's cloak! How is it possible to stitch together Piedmont and Sicily, Milan and Naples, different races, conflicting manners, repugnant traditions?" His liberal interlocutrix replies, "That will be the work of time. Let us meanwhile be content with political unity: real unity will come by and by." "But he," adds the novelist, "only shook his head, regretting the days of Sicilian autonomy—of the national monarchy." To this old *marchese* of fiction Sicily was the real nation. To the Piedmontese nobles of flesh and blood whom D'Azeglio describes in his 'I Miei Ricordi,' patriotism meant no more than devotion to the sub-Alpine kingdom and to the House of Savoy. To this day the pushing, stirring Sicilian, or Neapolitan, who is invading every field of activity, and especially those of financial speculation and political life, which most attract his mercurial nature, is regarded with as much suspicion and aversion as any foreign intruder might be by the more saturnine Tuscans and North Italians whom he jostles and elbows out of his way in his fussy restlessness.

I must not be understood as undervaluing what has been accomplished already in Italy toward the achievement of the real unity spoken of in the passage just quoted. Much has been done by an intelligent and patriotic press; much by those institutions which bring together for a common purpose the Italians of the different provinces. Among these institutions I may mention the Parliament; the civil service, with its promiscuous scattering of officials of diverse origin over all the land; but chiefly the national army, which has done what no other agency could accomplish, by bringing together the men of the lower classes in barrack and bivouac, in the camp, and on the battle-field; by inspiring them with a true and enthusiastic devotion to a common flag, and by teaching them, in the regimental schools, to speak, read, and write one common language, in lieu of a score of local dialects.

Notwithstanding all this excellent work, much remains to be done to secure real unity in the lowest, and perhaps also in the highest, stratum of society. This need excite no wonder. The case of Italy is essentially different from that of Germany, a nation of equally recent birth. In Germany the standard of popular education was far higher than in Italy, and the seeds of a truly national feeling had been abundantly sown at the time of the war of liberation, when she rose with such admirable unanimity against the first Napoleon; and, although there were in Germany religious differences which do not exist in Italy, there was, on the other hand, a far better acquaintance and a fuller intercourse among the constituents of the present Reich than ever existed among the petty states of Italy. After all, we should not overestimate the real unity of the German Empire, where it might not be difficult to discern a deep jealousy of Prussia, and a growing dissatisfaction with her virtual absorption of the other members of the Reich. As to Austria-Hungary, whose new birth as a constitutional monarchy is also recent, national unity, although now become desirable and desired, is not so indispensable to her as it is to Italy. The farrago of nationalities which that empire includes have been held together for centuries in a merely po-

litical unity by the strong hand of an ancient dynasty ruling over them all in severalty, and rather preferring, until very lately, that they should remain disunited in feeling; whereas, Italy has not in her ruling dynasty any such secular traditions of imperial sway, and must depend in a far larger measure upon the formation and growth of a sentiment of true national unity to give her the requisite stability which Austria inherits from the ages. In Austria-Hungary many centuries of subjection to one and the same master has done little to reconcile Hungarian with Czech, Croatian with German, Pole with Illyrian. It is not, I am sure, an extravagant estimate to say that two or three generations must pass away before the Italians are as truly one people as the French or the Spaniards are to-day.

In the year 1887 this half-consolidated nation formally enrolled itself among the so-called "'Great Powers" of Europe by openly and even ostentatiously subscribing to the Austro-German alliance, to which it had belonged in a less open way since 1883. This step was taken during the premiership of Francesco Crispi, a Sicilian statesman whose theatrical and Jack-in-the-box politics remind one of the late Lord Beaconsfield; and I believe that it was taken unwisely, and has delayed for many years the prosperity and consequent influence which all men felt to be in store for the Italian kingdom. It was Italy's misfortune to be the foster-child of Diplomacy. Every reader is familiar with those events which led to the birth of the new nation. Count Cavour had conceived the bold plan of engaging the little kingdom of Sardinia in an offensive alliance against Russia, well knowing that if England and France should accept Sardinia as an ally, the Italian question could no longer be blinked. In this plan he succeeded, whatever some Italians to-day may find it convenient to forget, by the aid of Napoleon III. Everybody knows how the acceptance of the Sardinian contingent by France and England in the Crimean war, and the admirable conduct of those troops, led to the admission of a Sardinian envoy to the congress which terminated that war by the Treaty of Paris in 1856; and how, in spite of the efforts of Austria, with whom, for her selfish neutrality during the conflict, all the belligerents were profoundly disgusted, the Italian question came to be discussed. This was the very moment of the conception of that Italy which came to her full birth only fourteen years later. Before that time the nascent nation found itself already entangled in the political complications of Europe, being in fact forced to avail itself of them in order to attain to its final plenitude of existence. For although Italy was in a certain sense a *fait accompli* even immediately after the Franco-Austrian war of 1859, she was not able to complete her political unification without the aid of Prussia in 1866 and of Prussia and Austria in 1870.

She thus came into being with old scores to pay, and predestined, as it were, to play in this age the same part that her Dukes of Savoy had formerly played in the wars in which Austria, France, and Spain were the great champions. Accordingly, after 1870, there was no great interval before significant visits began to be exchanged between the Italian and the German and the Austrian courts; and in 1875 the Emperor William was able to announce to the Reichsrath that an *entente cordiale* existed between his Government and that of Italy. This was but natural. Italy owed nothing to France, but only to Napoleon III.; and she regarded that debt as amply paid for by the cession of Nice and Savoy, if, indeed, it had not been quite blotted out by the attitude of France and the Emperor in keeping the Italians out of Rome. On the other hand, she owed Venetia to the Prussians, and Rome to Prussia and Austria. It was evident that everything was pushing Italy to Northern alliances. Again, the Emperors of Germany and Austria, both interested in imposing inactivity upon France, then burning to avenge the defeats and losses of 1870, might well wish to forestall a *rapprochement* between France and Italy; and it seems probable that, as early as 1875, hopes were held out to the Italian statesmen of a definite place for Italy among the "Great Powers," and a treaty to guarantee that place as soon as she could show a sufficiently imposing strength. These projects might have been sooner realized but for a coolness which arose between Austria and Italy by reason of the Irredentist movement of 1878. This, it will be remembered, was an agitation set on foot by Garibaldi and other enthusiasts, who claimed that the district of Trent and the whole of Istria, including Trieste, all of which they chose to call "unredeemed Italy (*Italia irredenta*)," should be surrendered by Austria to Italy because the former had acquired Bosnia and Herzegovina by the treaty of Berlin. This coolness might have lasted many years but for the French conquest of Tunis in 1881. This gave great offence to the Italians, who had important interests in that country and who affected to regard that conquest as "disturbing the equilibrium of the Mediterranean," a phrase more full of sound than of sense. Thereupon King Humbert ventured upon a visit to Vienna, which led to a treaty of alliance with Germany and Austria in 1883. This treaty, which at first was kept secret, was to expire in 1887.

In 1887 it was apparent that the treaty of 1883 had cost the country enormously. As far back as 1877 the Italian Government had thought it necesssary to prepare for such an alliance by extensive armaments, and this policy had been farther pursued after the treaty of 1883, and probably as a condition of it. In 1888, a date which will spare us the repetition of many dry figures, the Italian fleet was second only to that of England, and contained seven armored vessels more powerful than any to be found in the fleet of any other nation. On the 1st of July of the same year the interest on the public debt was more than $112,520,000, while the deficit for the year was considerably in excess of $7,000,000. The treaty signed by Signor Crispi called for still greater sacrifices. The army budget for the year 1888-1889 rose to sixty million dollars, while the navy estimate for the next eight years after 1888 reached the sum of twenty millions per annum. It has taken ten years to convince a majority of the Italians that the premature enrolment of their country among the Great Powers of Europe was dear at the price. One immediate result was an aggressive, braggart tone of which even we, in this country, had a taste when the Marchese di Rudinì, in a very just cause, but not quite *suaviter in modo*, twisted the tail of the American eagle in the most approved Jingo style. Italy, bent on imitating the older nations, even embarked more extensively in African colonization, instead of wisely abandoning her unprofitable settlement in Eritrea after the check received at the outpost of Saati in February, 1887. To-day, after the disasters and disgrace of the war with Abyssinia, the preponderance of sentiment among sober-minded Italians is that defeats and mistakes should be frankly and quickly acknowledged, and that Italy should set the shining example of a nation not ashamed to confess her past follies and resolved to return to those ways of moderation, of thrift, and of well-directed industry from which her ambition has seduced her. If Italy continues in this way, if she devotes herself to restoring her credit by keeping her expenses within her income and reducing her excessive debt, while she conciliates all her neighbors by an attitude at once peaceful and dignified, it seems quite certain that the next century will see her in fact as well as in name one of the really great Powers of the civilized world.

FRANCIS PHILIP NASH.

INEDITED LETTERS OF NAPOLEON I.—I.

PARIS, July 29, 1897.

During his reign, Napoleon III. ordered the publication of the correspondence of Napoleon I. as a tribute to his memory. The work was executed between the years 1858 and 1869, under the supervision of a committee, which was presided over by Prince Napoleon. The correspondence was published in no less than twenty-eight quarto volumes, and contains about 22,000 letters, decrees, orders of the day, bulletins, etc.; but it must not be imagined that these twenty-eight volumes contain the whole correspondence of the Emperor. About a third of the letters and documents still remain unpublished or have been destroyed.

Prince Napoleon, President of the imperial committee, in a report addressed to his uncle in 1864, said: "In general, we have taken for our guide this simple idea: we thought that we ought to publish what the Emperor himself would have yielded to publicity, if, surviving himself and anticipating the verdict of time, he had chosen to show to posterity his person and his system." Acting on that principle, the committee left unpublished all the letters which might have tended to diminish the prestige of the great Emperor, the letters which related to his quarrels with his brothers, those which were thought too injurious to some of the marshals or high dignitaries of the State, many letters concerning the Pope, the police, the press, etc. Many indiscretions were committed at the time, and I remember having heard some curious passages from the correspondence of Napoleon with Josephine (after his marriage), written from Italy and from Egypt. It is well known that Prince Napoleon destroyed a number of these letters. In 1864, an officer of the Emperor's staff was sent by him to the archives and took to the Tuileries forty-two letters, fifteen of which have disappeared, probably in the burning of the Tuileries in 1871. M. Léon Lecestre has undertaken to publish the inedited letters of Napoleon between the years VIII. and 1815; he has not published

any of the letters written before the Consulate, as various publications contain them nearly all. The two volumes thus compiled form certainly a most valuable addition to the publication made under Napoleon III., and will probably be read with much interest, as they contain what may be called the most dangerous part of Napoleon's correspondence. M. Lecestre, if I may use a vulgar expression, has taken the plums of the pudding.

In his 'Representative Men' Emerson takes Napoleon as the type of the man of action. Could he have read the two volumes just published, he would see in them a justification of his definition. It is impossible not to be struck, at every line, by the directness, if I may say so, of Napoleon's mind. Though his complete correspondence fills so many volumes, not a line has been written in vain, not a word is useless. Napoleon writes as he thinks, and his thought never wanders, never gets lost; it always has an immediate object; the clearness of the style is the mirror of an intellect which is clearness itself, and, in the height of passion, shows no mark of disorder or confusion. It is generally thought that diplomatic language ought to be enveloped by prudent circumlocutions, and by a dubious obscurity. Talleyrand, a model of diplomatic expression, said once that language was given to man to conceal his thought. In the long and numerous diplomatic notes and memoranda sent by Napoleon to his ministers, you will find a style very different from the usual diplomatic style. While every precaution is taken with regard to possible eventualities, every side of a question examined, every mode of persuasion examined, the mode of action to be adopted in a given situation or complication is always laid down with the greatest possible clearness; no choice is left to his agents, they have nothing to do but to obey. When you come out of this huge mass of correspondence, you feel almost oppressed by the gigantic effort of which it is the daily, almost hourly, proof, as well as by the tremendous power of a will which allowed no other will but his own, which denied liberty, not only to his own family, not only to his companions in arms, not only to his own people, but to all nations; not only to all national powers, but to all spiritual forces. He was a sort of inspired egotist. His egotism had nothing mean and narrow in its essence, it always aimed at something great; he cared not for money, nor for pleasure; he cared only for power and glory; and for him there was no glory but in power.

In his famous portrait of Napoleon, Taine constantly refers to the Italian origin of the Emperor; he compares him with the Italian tyrants of the Renaissance; only, while these petty tyrants exercised their faculties in the small horizon of a city, fortune gave to Napoleon a wide field—it gave him not only France, but the whole of Europe. The Corsican character of the Emperor is nowhere better shown than in his letters to the members of his family. He had the true clannish feeling, which has been so remarkably maintained in Corsica; and, while he thought that his duty was to promote the interests and fortunes of all the members of his family, he believed that he had a right to their absolute devotion and obedience. He did not distribute to them pastures and olive trees, but kingdoms; but he always looked on them as if they were all living in the neighborhood of Ajaccio. Lucien is the object of constant reproaches. Napoleon finds fault with him when he has made him his Ambassador at Madrid. Lucien is scolded on account of a treaty made with Portugal; he is thought too weak in his dealings with the Prince of Peace. "If this system continues, say boldly to the Queen and to the Prince of Peace that it will end by a *coup de tonnerre*" (December 1, 1801). Lucien married a Mrs. Jouberthon without asking permission of his brother, and fell from favor immediately; he was deprived of his rights as a French Prince when Napoleon became Emperor. Napoleon offered to give them back to him if he would consent to a divorce:

"The divorce from Madame Jouberthon once proclaimed, with a great title at Naples or anywhere else, if Lucien will have her near himself, on condition that it be not in France, he may live with her—not as the Princess, his wife—in any degree of intimacy that may please him. I will put no obstacle in the way of it, for it is only politics which interest me. I will not run counter to his tastes and his passions." (Letter to Joseph, King of Naples, from Milan, December 20, 1807.)

In 1810, we find a letter from Napoleon to Count Laplace, the Chancellor of the Senate, ordering him to strike Lucien from the list of Senators. "Absent for five years from the territory of the Empire, and, when Rome became a part of it, having left this place to cross the seas and retire to America, he has renounced the duties and the title of Senator."

Joseph Bonaparte, first King of Naples, and afterwards of Spain, was more obedient than Lucien; he submitted meekly to the advice of the Emperor, but he was weak and incompetent, and Napoleon has often to blame him: "I have received your letter of the 10th of August. All that is going on in Spain is deplorable. . . . How can Spain be thus evacuated without your even knowing where the enemy is? . . . The army, as it is organized, can beat all the insurgents, but a head is wanting." (Saint-Cloud, August 16, 1808.) In 1813, Napoleon writes from Dresden to Cambacérès, that he sends the Duke of Dalmatia to Spain as his Lieutenant-General:

"As for the King of Spain, my intention is that he shall remain at Pampeluna, San Sebastian, or Bayonne, and shall wait my orders. In any case, my intention is that he shall not come to Paris, and that no high dignitary, no minister, no senator or councillor of state shall see him before my intentions be made known to him. The King ought not to cross the Loire without my order; but if he has done so, it would be best that he should go in the greatest incognito to Morfontaine [Joseph's country place near Chantilly] . . . You will employ force, if necessary, for the execution of my orders."

Napoleon attributed to Joseph the failure of the Spanish expedition; he was extremely discontented with him. "It is ridiculous," he says, to Cambacérès, in a letter from Wittenberg, "that the Prince should not clearly know that I blame him for all that has been done in Spain in the past five years. He has shown neither military talent nor administrative faculty." He writes again from Dresden, July 20, 1813, this time to the Duke of Rovigo:

"My positive intention is that the King shall not come to Paris, or even approach it. Let him remain at Morfontaine. If he goes to Paris or Saint-Cloud, have him arrested; let him know this. . . . The miscarriages in Spain are all the greater because they are ridiculous; such is the opinion of the English themselves. But the army is not dishonored; the Spanish army had no general, and the King was a burden. In the last analysis I am not blind to the fact that it was all my fault."

The last letter published in M. Lecestre's two volumes is addressed to Joseph, from Philippeville, June 19, 1815: "All is not lost. I suppose that I shall still have 150,000 men. . . . I will summon 100,000 conscripts, arm them with the guns of the royalists and the bad national guards; I will raise Dauphiné, Lyonnais, Burgundy, Lorraine, Champagne; but I must be aided. . . . I am going to Laon. I have not heard from Grouchy." It was too late, and Joseph, who had been left behind in Paris, had no part to play in the last struggle.

The letters to Louis, King of Holland, are a never-ending succession of reproaches, and a constant curtailing of the attributes of the King, whose power had really become nominal. Napoleon threatens him perpetually with the incorporation of Holland in the Empire, and consents to preserve Holland as a kingdom only if he can govern it and be obeyed in everything. Some of the letters to Louis are very characteristic:

"We hear that you have in your states reëstablished the nobility, with its titles and privileges. How is it possible that you should have had so little discernment as not to feel that nothing can be more injurious to yourself, to your people, to France, and to myself? You are a French prince; how could you forget your first oath, which consists in maintaining equality among your peoples? . . . You thus renounce the throne of France; for a man who would rob the nation of what fifteen years of struggle and of effort have obtained for it, would not be worthy to sit on it. . . . You have lost your head. You may expect anything if you do not revoke this measure. You will cease to be a French citizen and a prince of my blood."

If such was his language to Louis, the King of Holland, you may easily imagine how he treated Jerome, his younger brother, whom he had placed on the throne of Westphalia. Louis tried, at least, to be a real sovereign, and took to heart the interests of Holland—sometimes too much so to please Napoleon, who, in his great struggle with England, obliged Holland to make great sacrifices. Jerome was a light character; he constantly plunged into debt, and was a poor soldier.

"I have seen an order of the day of yours which makes you the laughing-stock of Germany, Austria, and France. Have you nobody near you who can tell you the truth? You speak as King, as brother of the Emperor—ridiculous qualities in war. You must be a soldier, and again a soldier; you need no minister, nor diplomatic body, nor pomp. Be at the bivouac with your vanguard, day and night, on horseback; go to the front to get news; or else remain in your seraglio. You make war like a satrap. Have you learned this from me?" (Schönbrunn, July 17, 1809.)

Correspondence.

CANADA AND THE UNITED STATES.

To the Editor of The Nation:

Sir: In your number of August 5, speaking of the relations between Canada and the United States, you say: "Separation has become our settled policy, and the commercial union with England which we have

forced on Canada will grow closer and stronger as years go on." You seem inclined to think that the situation created by the Dingley tariff, combined with the Jubilee fever, will be lasting, and will decide the destinies of this continent.

How often has the action of the great forces, sure in the end to prevail, been suspended, and long suspended, by that of the secondary forces or by adverse accident! How often did the unification of Italy and that of Germany miscarry, though certainly destined at last to arrive! Protectionism will run its course. The Jubilee fever will abate. The time will come when American statesmen, now so indifferent to this question, will see that if it was worth while to spend all that blood and money in averting the establishment of an antagonistic power to your south, it is not less worth while to bestow political effort in averting the establishment of an antagonistic power to your north, and that the British Canadian is at least as desirable a citizen as the Southern white or negro. British statesmen, on the other hand, will learn the hopelessness of their attempt to keep five millions of North Americans out of North America and attach them to Europe. The day will come, though men of my age are not likely to behold it. Already, in spite of all the wrangling among the politicians, the two sections of our race on this continent are rapidly fusing. Hardly anything now divides them but the political and fiscal line.

Yours respectfully, GOLDWIN SMITH.

TORONTO, August 14, 1897.

A NEW PARTY, NO NEW NAME.

TO THE EDITOR OF THE NATION:

SIR: A communication in the *Nation* for July 29 suggests the following:

At present the really live question in regard to a political organization is, "Is the National-Democratic party the new party?" If it is, whether that party has taken the name best adapted to its mission is a matter of only secondary importance. The individuals to whom we must largely look for support of "sound" principles are not men who will be greatly influenced by a name; yet, so far as the new party must draw votes rather by the sound of its title than by the sense of its platform, the name "National Democratic" is advisedly chosen. The men who are to compose the new party are, first, the truly independent voters, whose prejudices, if they have any, favor the party name under which they have so long supported Mr. Cleveland; second, the dissatisfied Republicans who leave their party from conviction and are not to be lightly influenced by a mere name; third, Sound-Money Democrats; and, last—other Democrats. In other words, the only men, not distinctly men of conviction, whom the new party can hope to reach are former Democrats; the only men who will at all consider the name adopted at Indianapolis are men who will approve of it.

Those who are dissatisfied with the name "National Democratic" quite generally express themselves as believing that we should have a new party with a new name, as in '54. The "new party" of '54 was a grandchild of the National Republican party of '28, which latter took its name from the old Democratic-Republican party. It is interesting to notice, in this connection, a communication from Cassius M. Clay to the Republican convention of February 22, 1856. Mr. Clay wrote: "I approve of your central organization of the 'National Republican Association' "; and, further: "We are no new party; we avow no new principles; *we want no new name.*"

Respectfully yours,

LLOYD C. WHITMAN.

ANN ARBOR, MICH., August 12, 1897.

PENNSYLVANIA TO DATE.

TO THE EDITOR OF THE NATION:

SIR: The situation has changed. The Legislature has done its worst and adjourned. Gov. Hastings is now busy counting the spoons. The Combine (spell this with a big "C") has got all there was worth getting, and the anti (little "a") got the rest. The "ripper" bill and the electric-light bill and the Becker bill and the mercantile-tax bill were passed by the Legislature merely to show what the Combine could do if it wanted to, and the Governor has been permitted to veto them to show that there is no real animosity between the different sections of the dominant party. The Republicans simply fulfilled their pledges to the people of the Commonwealth. The Combine took "money out of politics," as Senator Quay's convention last year said it would, and fixed things for "running the State Government on business principles," as the Business Men's League has determined it shall be run. The difference between the political merchant and the mercantile politician may be discovered right here: both of them take money out of politics upon business principles. The Treasury deposits in selected banks are still there, as Quay intended they should be.

But there is more in the situation now than Senator Quay's legislation and the Governor's vetoes. There is a hereafter—almost here. A great many people profess to believe that the State Capitol was burned down for the purpose of destroying the archives containing a lot of investigation material, and the crowd of believers is growing. The Prohibitionists have seized this belief, and, with their characteristic energy, have made a ticket which will assist Mr. Quay by as many votes as they are able to keep away from the consolidated opposition. The Reading convention of nondescript Democrats will meet on the 31st instant, and an attempt will be made to sidetrack the silver issue and put a compromise ticket in the field with a hope that the Sound-Money Democrats will then forego the pleasure of taking an active part in the coming campaign. The result will then be precisely what it has always been when that sort of politics has governed the Democratic party in Pennsylvania. Mr. Quay's ticket will win. "Pap" will again be "vindicated," and there will be no parties worth mentioning in the State except the Combine and the anti next year.

But the situation may change again. Mr. Given is State chairman of the Sound-Money Democratic party, and he has called his executive committee together for September 2, two days after the Reading convention. There will be a gathering at that meeting such as Pennsylvania has seldom seen or heard. No one can tell what the result will be, but if it accomplishes a vigorous call for a convention and the probable nomination of Hon. John C. Bullitt to be State Treasurer, and an equally high-grade Sound-Money Democrat to be Auditor-General, good people in the Keystone State and in the Union may begin training their voices for the Te Deum. The Reading ticket will have a short spasm of innocuous desuetude and evaporate, and the Prohibition ticket will get its usual harmless vote, but Quay will be beaten, and Mr. Wanamaker's complaints about the corruption fund which the State Treasurers have been accumulating for thirty years will get a popular response of which he did not dream when he made them. The Treasury of Pennsylvania will be reformed by the man who gave Philadelphia the only good charter the city has ever had.

It is inconceivable that the Sound-Money Democrats should fall into the trap which a dodge of the silver question at Reading would set for them. They have nothing to gain from a union of the opposites which form the two discordant elements of partisan Democracy in Pennsylvania. Such a union would simply short-circuit the current and shock everybody within reach of its influence. The real party, which has principles and traditions and a history and priests and bishops of its faith, and a goodly lot of canonized saints, will be a long way better off when it is rid of the element of Populism which threatens its ancient title to respect. It needs, throughout the Union, the courage to trust the people. It can get nothing from any compromise with an untrustworthy element.

But in Pennsylvania there is a foolish hope that some huggermuggery now will open the way to the campaign next year, and the suggestion of a compromise at Reading is born of that hope, and of certain requirements of Philadelphia politics which have no connection with political principles or party traditions. Ever since Sam Randall showed how a Democratic politician could control a Republican congressional district in Philadelphia, political principles there have been regarded as snares and delusions. Only since Mr. Bullitt and Mr. Dickson and Mr. Baer and Mr. Given and Col. Farquhar and others have determined that Populism and tomfoolery shall not dominate the Democracy, has there been a Democratic party in the State worth following. If it now consents to any process that seems to absorb it into the general mass of conglomerates which will assemble at Reading, you will never hear of it again.

If it should turn out that Quay's hand is at the bottom of the suggestion, and that the whole scheme has been concocted to prevent the independent action of the Sound-Money Democracy, to save Mr. Harrity from getting the bag as a member of the Bryanized national executive committee, and to help Quay control Martin in Philadelphia, nobody will be surprised. If it succeeds, every good man who knows anything will be disappointed. B. C. P.

MEDIA, PA., August 18, 1897.

Notes.

The method of teaching English employed in the Massachusetts Institute of Technology will be set forth in 'Freshman Composition,' by Henry G. Pearson, with an introduction by Prof. Arlo Bates. The publishers are D. C. Heath & Co., Boston.

Ginn & Co. have nearly ready a 'Shakspere Note-book,' designed for advanced courses

in colleges and universities, by Prof. Charles W. Kent of the University of Virginia.

A 'Short History of Rome,' by E. S. Shuckburgh, and a new 'Handbook of European History,' by Arthur Hassall, are in the press of Macmillan Co.

Gen. Sir Henry Norman, formerly Governor of Jamaica, and of Queensland, is engaged in writing his memoirs. Sir Henry's military services in India were very distinguished, and his story should be an interesting one.

Mr. W. M. Griswold has prepared an index to Volumes of Proceedings of the National Educational Association, 1871-1897, and (under its former style of the National Teachers' Association) 1857-1870. This volume, of less than a hundred pages, is published by the Association at Chicago. Its classification calls for some study before the seeker can make use of it with confidence, as, for example, if he wishes to turn up the discussions of Luncheons or Promotions, which have no place in the dictionary arrangement. The various speakers, and authorities cited, are duly listed.

'Sound Money Monographs' (G. P. Putnam's Sons), by W. C. Cornwell of Buffalo, is a reprint of speeches and pamphlets by that sound thinker and clear writer. The longest of the series is the monograph of twenty-four pages entitled "Greenbacks," which was published during the campaign of last year and had a large sale. In this incisive document the vices of the existing currency system are set forth in terms that anybody can understand. The definitions are simple, the style easy and engaging, and the argument quite invincible. Mr. Cornwell's brief exposition of the "Money Power" is equally illuminating. He shows that the Money Power consists of all the surplus earnings of all the people, collected together as pools are formed from numerous rills running to a common meeting-place or reservoir. Mr. Cornwell is a believer in the Baltimore plan of banknote issues, with the addition of branch banks under certain restrictions as to capital. Although he is the President of a State bank, he is opposed to the repeal of the 10 per cent. tax on State-bank issues. "To go back twenty-nine years," he says, "and tear down the delicate network of safety which has developed around the National system, and, by a repeal of the 10 per cent. tax, start over again, would be a crude and unwise move, a retrogression, and unnecessary, because every good feature of State-bank issue can be grafted on the strong and efficient trunk of the National system." The book contains 178 pages and has a good index.

Mr. Bernard Bosanquet continues to put the academic world under obligation by enabling it to inform itself of the nature of "university-extension" lectures at their best. He has now followed up the 'Essentials of Logic' by a little book entitled the 'Psychology of the Moral Self' (Macmillan), which purports to give an account of modern psychological conceptions in so far as they appear to have a direct bearing upon ethical problems. In reality, the work is almost wholly psychological in character, and exhibits the author's familiarity with recent psychological speculation. Whether, however, Mr. Bosanquet was well advised to attempt to treat so many difficult and debatable subjects in so brief a compass, is another question altogether.

Part I. of 'Baumwollproduktion und Pflanzungswirthschaft in den Nordamerikanischen Südstaaten,' by Dr. Ernst von Halle, has been received from the press of Duncker & Humblot, Leipzig. This is a comprehensive and carefully written monograph, which treats of a subject that has needed, and never received, a thoroughly scientific treatment. Dr. Halle devotes the whole of his first volume to the cotton industry of the Southern States during the period of slave-labor, and promises a second instalment that shall treat of cotton production since the Civil War. Reserving more extended comment until the completion of the work, we may remark that the author has investigated his subject, with the customary German thoroughness, in most of its technical, economic, and political aspects. The careful student of our economic history will find the monograph a mine of information, while other readers will rather be repelled by the wealth of conscientiously elaborated details.

'Die Imperialistische Socialpolitik: D'Israeli, Napoleon III., Bismarck,' by Georg Adler (Tübingen: Laupp), is a rather interesting comparative study, sketching briefly the socialistic ideas and schemes of the three statesmen named, and leading to the conclusion that "imperial socialism" constitutes an important step towards the enlistment of the proletariat in the ranks of modern society; that it is an illusion, but an illusion of great historical significance. The development of the social movement in England, France, and Germany is also outlined in the fourth lecture of a course delivered in the fall of last year, at Zurich, by Prof. Werner Sombart of Breslau. These lectures are now published and are having a large sale under the title, 'Socialismus und Sociale Bewegung im 19ten Jahrhundert' (Jena: Fischer). The reader who shares Prof. Sombart's view that the modern social movement, in its principal features, is a necessity, that the motto, "War is the common father," applies also to social life, will have to accept his opinion that the social struggle can result in the good of humanity only if it be carried on by lawful and fair means. In an appendix the attempt is made for the first time by the author to present in a synchronistic table the most important dates of the modern proletarian movement (1750-1896).

An Ariadne's thread out of the labyrinth of opinions on "modern" painting is to be found in W. von Seidlitz's two essays on 'Die Entwickelung der modernen Malerei,' forming No. 265 of the well-known series founded by Virchow and Holtzendorff (Hamburg: Verlagsanstalt). Everybody interested in contemporaneous art has some idea of its principal currents, but to form a clear conception of their distinguishing characteristics is a difficult matter, the more so because professional artists are even not disposed, or else not prepared, to help those seeking information. The recent philippic against modern art by A. von Werner in the Berlin Academy, does not lack plainness of speech, to be sure, but Werner's views are not shared by many leading or talented painters of the day. Von Lenbach also has spoken harsh words of similar tenor, but his condemnation is less sweeping, and his position is not hostile to the modern tendency *in toto*. Longer treatises on the question are, of course, not wanting—Carl Neumann's 'Der Kampf um die neue Kunst' has just appeared in its second edition (Berlin: Walther)—but Seidlitz's little work is especially to be recommended for the conciseness, clearness, and impartiality with which the aims and means of the more original artists, since Manet's discovery (or rediscovery) of the *plein-air* principle, are set forth.

In the San Francisco *Chronicle* of August 1, Mr. Charles F. Lummis makes some highly interesting and authoritative comments on the unofficial report of Prof. Libby's recent exploration of the summit of the Enchanted Mesa in Western New Mexico. This bold sandstone "island" is some 900 feet high and now inaccessible except by balloon, or by line and mortar which Prof. Libby employed. He found nothing that, to his eye, indicated human occupation in past ages, but Mr. Lummis points out the extraordinary effects of subaerial erosion in that region, and the need of aboriginal or expert inspection before the ancient legend of occupation can be discredited. He also shows that one end of the rock has been gullied out to an extent beyond the area required for the largest structure that could have been built on the plateau, so that time may have destroyed the work of man together with the natural foundation.

The *Quarterly Review* for July contains an article on "Henri" Taine. This oft-corrected, still recurrent, blunder is noteworthy in this instance for its pervasive thoroughness. Henri Taine appears on the cover of the review, in its table of contents, in the title and running-title as well as in the body of the article *passim*, and is spread abroad in all the advertisements of the number which have appeared in the newspapers.

M. Bischoffsheim, the Paris banker, everywhere known also as a princely benefactor of astronomy, has just distributed among American astronomers the sixth volume of the *Annales* of the Observatory at Nice, which was founded by his munificence many years ago, and is maintained in charge of M. Perrotin as director. The volume is entirely the work of the assistants of the Observatory, M. Javelle contributing a fine catalogue of nebulæ newly discovered with a great 30-inch equatorial; but the volume is for the most part filled with technical detail of observations with the meridian instruments. M. Simonin presents a masterly discussion of the orbit of the small planet Hecuba discovered by Luther at Düsseldorf in 1869, whose interesting peculiarity is that its mean motion is about double that of Jupiter, presenting, therefore, many difficulties inviting the skill of the astronomical geometer; and M. Simonin succeeds in showing clearly that the methods of the new *mécanique celeste*, on account of their simplicity, afford a very close solution of the movement of this little body round the sun.

Literary Americans cannot but take an interest in the fortunes of the great English public school, Christ Hospital, familiarly known as the Blue Coat School. It is some years since the governing body determined to sell their valuable premises in the heart of the city of London, and, like the Charter-house School, to go into the country. It is now arranged that the Prince of Wales shall lay the foundation-stone of the new buildings at Horsham on the 23d of October. The transfer of the school will hardly take place before two years.

Recent transactions in journalistic property in England show that enterprise in newspapers, when in competent hands, leads to wealth on a large scale. A provincial

newspaper, the Manchester *Courier*, with its satellite, the Manchester *Evening News*, has just been successfully launched as a Limited Liability Company, at a valuation of £300,000. Sir George Newnes is converting the hitherto profitable journalistic and publishing company of George Newnes, Limited, into a yet bigger concern, with a capital of £1,000,000. The enterprise was started with *Tit-Bits* in 1881, by the then Mr. Newnes. By degrees the *Strand Magazine*, *Woman's Life*, the *Hub*, and other publications were added to the business. The concern was turned into the existing company in 1891. The profits amounted in 1895 to £57,000, in 1896 to £60,000, in 1897 to £66,000. The one-pound shares, issued at a premium of five shillings, are now worth £2-12-6 each. The *Strand Magazine*, a sixpenny, sells to the number of 400,000 a month, and notoriously has a very large circulation on this side of the water. Sir George Newnes is a remarkable instance of a man's attaining to rank and fortune by self-help. Not so many years ago he kept a small shop in a back street in Manchester. To-day, though only in middle life, he is a baronet of the United Kingdom, and a man of vast wealth. He was a member of the House of Commons, but was defeated at the last general election.

For years past it has been the custom of many booksellers in England to allow to purchasers two pence or three pence in the shilling discount upon the published prices of books. In recent years a long-drawn-out controversy has arisen as to the policy of this system, which is objected to by some of the publishers and by the smaller booksellers, as injurious to the book-trade. The smaller booksellers especially say that they cannot afford to give the discount, which so reduces their income that they have to eke out a living by selling stationery and fancy articles not in the line of an ordinary bookseller's business. The whole matter has just been advanced a stage by the appointment of a sub-committee of the managing committee of the Society of Authors, to examine into the question. This is the result of communications that have passed between the chairman of the Publishers' Association, Mr. Charles Longman, and the chairman of the managing committee, Mr. Rider Haggard. The sub-committee will meet in October. Meanwhile, some publishers have adopted the system of issuing their books at net prices.

For vexatious litigation with a vengeance, commend us to the case of Williams versus Wright, the printer and publisher of the London *Times*, heard in the Queen's Bench division of the High Court of Justice on the 29th of July. The plaintiff, Williams, objects to the provisions of the Sunday observance act, passed in 1781. Avowing himself to have no religious belief, he refused to be sworn. His object in taking the proceedings was, he said, in favor of the utmost liberty being enjoyed by every one on Sundays. So he struck at the act through the *Times* newspaper, on account of an advertisement that appeared in that journal, on the 20th of March last, of a public entertainment or amusement on the Lord's Day. Williams, therefore, sued to recover a penalty of £50 from the defendant, in terms of section 3 of the act. The prosecutor had, however, not taken stock of the facts that on the tickets of admission to the entertainment were printed the words "Admission free." There was, indeed, a charge for seats; but it was not compulsory to hire a seat. The judge decided against the prosecutor, with costs, holding that "the statute spoke of admission, not to a seat, but to an entertainment." The case was heard by Mr. Justice Collins, who is one of the arbitrators chosen by Great Britain for the disposal of the questions of the boundaries between British Guiana and the Republic of Venezuela.

According to the recently published statistics of population in France, there were in 1895 17,813 more deaths than births in that country. The French are, in fact, the least prolific of all the nations of Europe. The annual number of births per thousand is as follows: Hungary 42.5, Italy 36.6, Germany 36.6, Austria 36.2, Holland 33.8, Great Britain 30.8, Belgium 29.5, Switzerland 28.5, France 22.1. There are other factors, however, which greatly modify this result and render it less unfavorable to France than it appears to be at first sight. Thus, the yearly number of deaths in France is only 23 per thousand, whereas it averages 26 in the rest of central Europe. The average number of children born to a family in France is 2.96, whereas in Germany it is more than 4. In some German cities (in Munich, for example) about one-half of the children die before they are a year old. In France, infant mortality is far less. In France, too, emigration is quite small; in Germany it is very large, and deprives the land of many of its most vigorous inhabitants at a time when they might contribute most to the industrial force and military strength of the nation. Indeed, it is probable that this productive class in France exceeds the same category in Germany.

The Oriental Seminary in Berlin, since its foundation in 1887, has developed a practical side, and is now performing a very useful function in the promotion of foreign trade. It has not only provided competent interpreters for the embassies and consulates of the German Empire in the East, and educated candidates for the colonial service, but it has exerted a decided influence upon German business circles by imparting special instructions to young merchants, bankers, and technologists who wish to engage in commercial or industrial enterprises in Asia and Africa. That a German consul who has received this kind of training has an immense advantage over an American consul who has been appointed to office on account of his efficiency as a "political worker," must be evident even to the most inveterate "spoilsman." The result is seen in the astonishing growth of German industries and exportations of manufactures within a few years.

Dr. Karl Brockhausen's report on the workings of university extension in Vienna during the last academical year is extremely encouraging. The number of persons attending the different courses of lectures was as follows, the attendance of the year before being given in parenthesis: Medicine, 2,488 (2,238); natural history, 2,624 (1,793); history, 694 (987); history of literature and art, 1,028 (852); law, 373 (229). According to the by-laws of the Association, lectures can also be delivered in the provinces, provided the request be made by private individuals or corporations, and security be given for the payment of the expenses incurred. There were two cases of this kind, one in Krems, under the auspices of the Volksbildungsverein, and one at Baden (near Vienna), under the dictation of the Catholic Gesellenverein. The hearers were encouraged to ask questions, and not only made a liberal and quite profitable use of this privilege, but also showed a surprising degree of intelligence concerning the subjects treated, including geology, geography, astronomy, anthropology, botany, German language and literature, history of the Greek drama, Latin, etc. The course of lectures on physics was exceedingly popular, so that the hall was overcrowded and parallel courses had to be arranged. Dr. Tuma expresses his astonishment at the comprehension of many difficult problems of electro-technics by persons belonging to the working classes; and Prof. Neumann, who lectured on the history of old Christian art, states that he never had more earnest and attentive auditors among the students of the university. An appropriation of 6,000 florins (nearly $3,000) was made by the Minister of Public Instruction.

In connection with and as a sort of annex to the Catholic University of America at Washington, a woman's college "of the same grade as Vassar," to be known as Trinity College, is to be established under the direction and control of the sisters of Notre Dame, whose mother-house is Namur, Belgium, and who are devoted exclusively to teaching. Sister Julia, Provincial Superior, may be addressed for particulars at K and North Capitol Streets; and endowments are solicited.

—Dr. Murray concludes the third volume of the Oxford English Dictionary, or the 'New English Dictionary on Historical Principles,' with the last instalment of the letter D (Oxford: Clarendon Press; New York: H. Frowde). He again has "to record the inestimable collaboration of Dr. Fitzedward Hall, whose voluntary labors have completed the literary and documentary history of numberless words, senses, and idioms, and whose contributions are to be found on every page." And another American is singled out among the Readers of the Dictionary, viz., Mr. Albert Matthews of Boston, who has contributed some 28,000 examples. In the section Doom-Dziggetai, *draw*, with its seventeen columns, perhaps claims pre-eminence. We may feel a slight regret that the sense 'to translate' has become obsolete, even if we are not left ill-provided with synonyms for this process. One discerns in Surrey's "translated into Englishe and drawen into straunge metre" an acceptable connotation of workmanship and art. Under the thirtieth division, 'to bring about as a result,' we would fain have seen quoted Milton's "that after no repentance *draws*," as, under *drench* 6, 'to drown,' there would have been place for the preceding line of the same sonnet, "deep thoughts resolve with me to drench In mirth." Those who have enjoyed John Woolman's scrupulous "draught towards the steerage" of his proposed West Indian packet, because of the needless decorations of the poop cabin, will miss the citation of it under *draught*, II. 6, 'inclination, impulse,' though we have there a similar contemporary phrase, "I felt a draught to visit New England." We have often wondered if Dr. Murray had a sufficient Quaker collaboration. *Draught* 46, ' a privy,' would seem to account for *draughty* 3, 'rubbishy, filthy,' all the more because of the date of the sole citation (1602). Hence we should put it first rather than third in the arrangement. It is surprising to find, in the division of mean-

ings for which *draft* has become established over *draught*, how slight is the phonetic inroad—7 for the noun and 3 for the verb *draft* against 46 for the noun and 5 for the verb *draught*. But for Dampier (1697), Washington would be the earliest citation (1756) for *draft* in any sense.

—That the alternative *drouth* for *drought* is maintained, we seem to owe to the poets, who find it handy for rhyming. But these gentry are responsible for more than they may care to be. Tennyson's daring "Little breezes *dusk* and shiver" (1832) was evidently in Mrs. Randolph's mind when she wrote (1879), "A copse of aspens dusked and shivered near the brink"; but the poetry of the word as applied to something invisible has gone clean out of it. A favorite metaphor of Lowell's is caught in his prose, "The sides of the road were *drifted* with heaps of wild hawthorn and honeysuckle," but missed in his verse (of a little lane), "Its *drift* of noiseless apple-blooms receives." One might have expected Edward FitzGerald to figure in illustration of *doubt*, 'to apprehend,' but he was overlooked or crowded out; in this, suffering the fate of words themselves. *Drain* appears in Old English at the end of the ninth century, and then is not heard of again till 1500. Chaucer (1384) uses *duration*, and how could Shakspere dispense with it? He did, as did men of letters generally after the above date till 1600, when it reappeared. *Double entendre* was good French in 1688, and Dryden uses it, in a purely French context, in 1673. It is common nowadays to rule it out as ungrammatical in favor of *double entente;* but this is not the sole example of obsolete French remaining correct in English. *Dot*, 'dowry,' has superseded *dote*, a sixteenth-century French variant of *dot;* but this might not have happened. In both these cases we may read the spread of a knowledge of the French language among Englishmen. The *dude*, which we in New York gave to the world in 1883, has, we believe, not passed the crisis of obsolescence. Regarding *dough-face*, nothing has been discovered prior to Bartlett's date of 1833; yet the citation from Whittier (1834) speaks of it as already "familiar." Some student of Randolph ought to hound this down. There is no cisatlantic citation for *dragoon*, and it is merely remarked that "in the United States Army the term is not used." True; but those of us who remember the Mexican War have only to turn to Grant's Memoirs (ed. 1895), i. 44, where he says of Taylor's army of occupation that, altogether, "it consisted of seven companies of the second regiment of dragoons," etc. In closing, we heartily congratulate Dr. Murray and Mr. Bradley on their new volume. In their next, let them bid their proof-reader render a final *s* to their fellow-lexicographers, Funk & Wagnalls, here twice docked of it.

— With vol. vii. of the 'Jesuit Relations' (Cleveland: Burrows Bros. Co.) the narratives enter upon a new phase. Prior to 1635 the missions were so few and struggling that the bulletins of the Superior sufficed to mark the progress made. After this date it was impossible for the official head at Quebec to report from personal knowledge upon all that was being done under his auspices. He continues to act as an editor, but relies more and more on the contributions which he receives from the Huron and Iroquois missions. Identity of training, method of observation, and aim is seen in the harmonious texture of the piece that was annually sent home. Le Jeune for the present continues to be the central figure, though we are warned by his enthusiastic praise of Brébeuf that the apostle to the Hurons is soon to take a more prominent part. "O l'excellent homme pour ces pays icy que le Père Brébeuf, sa memoire tres-heureuse, sa douceur tres-aymable, seront de grands fruicts dedans les Hurons." The language difficulty remains a prominent feature of Le Jeune's letters, and his own defective memory seems to cause him constant distress. Yet, after his winter with the Montagnais (already partly described in vol. vi.), he is in a position to write more intelligently about their tongue than before. A touch of humor is contained in the statement that he has learned most of the abusive words from their constant application to himself. When not calling him "dog" or "pumpkin-head," they sometimes amused themselves by giving him false information when he asked questions. His Christian retaliation was to correct their extravagant ideas of geography and astronomy; as, for instance, telling them the relative distances of the heavenly bodies, and that the ocean was not full of great cataracts like Montmorency Falls, which they had supposed must render navigation difficult. Le Jeune's hatred of the Huguenots, to which we have called attention in a previous notice, finds further expression in the second document of this volume, a letter to Richelieu: "Toute la France vous doit sa guérison ayant dissipé le venin qui luy gagnoit le cœur." The third and concluding piece is the beginning of the 1635 Relation. It is more occupied with individual cases of conversion than with ethnology and adventure; but, by comprising Brébeuf's first report from Ihonatiria (to appear in the next instalment), brings us to the central action of the enterprise.

—The reprint of the rare 'Lettre d'un habitant de Louisbourg' (Toronto: William Briggs), edited with an English translation by Prof. George M. Wrong, is an interesting contribution to the sources of our colonial history. It gives the only known French unofficial account of the siege and capture of this place, and, although it has been used by Mr. Parkman and other writers, this is the first time, to our knowledge, that it has been reprinted in its entirety. The writer signs himself "B. L. N.," and is evidently a person of some means, probably a trader, who conceals his identity on account of his severe strictures on the Governor and the French officers. The whole blame of the misfortune is charged to their folly, cowardice, and mismanagement. His comments upon the English are amusing, and at the same time instructive as showing the state of feeling between the two peoples. Of the nation generally he says, "The majority of them are engaged in piracy"; while of the New Englanders he writes, "These singular peoples have laws and a police peculiar to themselves, and their Governor carries himself like a monarch." He accuses Sir William Pepperell of permitting his soldiers to pillage, and adds, "What could we expect from a man who, it is said, is the son of a shoemaker of Boston?" The independent action of the land and sea forces, so great that "one could never have told in fact that these troops belonged to the same nation and obeyed the same prince," is merely one of the oddities characteristic of the English. "which nevertheless form a part of that precious liberty of which they show themselves so jealous." The writer tells a story of the siege of Annapolis Royal in 1744, which is new to us. The French commander had ordered the Acadians to make ladders to be used in the intended assault and paid them scrupulously for their labor. "The governor of the fort [Paul Mascarene], after our force had retired, told them that since France had paid them for the ladders which they had made, it was proper that England should pay them to destroy them; and in fact they were employed to do this." Prof. Wrong has added some useful notes to his translation, which is excellently done, though at times we detect a tendency to sacrifice the force of the original in order to secure smooth English. It is a sign not only of the progress of historical studies in Canada, but also of the growing intellectual unity of the Dominion, that this edition of a French booklet, primarily concerning Cape Breton, should now be edited, with the assistance of a learned abbé of Quebec, by a professor in Ontario, and published by the Ontario Government (for the letter appears also as an appendix to the report of the Minister of Education for Toronto).

—Readers of Bikelas's 'Tales from the Aegean' (McClurg, 1894) will be interested in the illustrated reissue of the original Greek tales, just published at Athens by Constantinides. Seven Greek artists, among whom the best known are Ralli, the illustrator of 'Louki Laras' (Didot, 1892), and Prof. N. Gyzis of Munich, are responsible for the illustrations, which are ninety-nine in number. The process of reproduction used is a familiar French one, and these same plates figure in a reissue of the French version of these tales by the late Marquis de Queux de Saint-Hilaire, which Didot has for some time had in the press. The brightness and delicacy of the Aegean atmosphere seem fairly to glimmer forth from the pages, scattered throughout the book, where Giallinas gives glimpses of Syra and Hermoupolis, a towering Teniote headland, a steep on the Cretan coast, and other vistas of the isles of Greece. Giallinas has the Aegean Greek's love for his native shores and seas; and it is therefore well that the landscapes of the book are chiefly his, including a remarkably fine drawing of a large stone-pine standing alone (p. 102). With this exception each artist has, in the main, confined himself to a single tale or group of tales. The story of "Philip Marthas," by many regarded as Bikelas's masterpiece, is illustrated by Gyzis, whose original drawings for it figured recently in an exhibition of his works held at Dresden, where they were greatly admired. Among them is a tender and exquisitely Greek vignette of a young mother and her babe, which is also reproduced on the title-page. Here Gyzis expresses the idyllic mood of his theme, but he has concentrated the power and pathos of this wild tale in a strangely beautiful Medusa-like head, representing the overshadowing fate of Philip Marthas. The good-humored comedy of "The Plain Sister" has been a little overstrained in some of Jacobides's illustrations, though in the main he has happily caught its characteristic note of affectionate *bonhomie*. The

closing tale of "The Two Brothers," on the other hand, requires a far more skilled and imaginative treatment than its illustrator, Phocas, can give, and a similar criticism must be passed upon Rigos's illustrations of the breezy sketch of insurrectionary Crete. But Rigos has amply retrieved himself in his genuine interpretation of the sad story of Christos and the mad wolf. Still more remarkable are the drawings of Lytras, which show forth the delicate humor and the pathos of Bikelas's account of "Papas Narkissos." Of Ralli's interpretation of the two remaining tales it is praise enough to say that they show him at his best, and exhibit a draughtsmanship more practised than that of his illustrations to 'Louki Laras,' long since commended in the *Nation*.

THE GREEK THEATRE.

Das Griechische Theater; Beiträge zur Geschichte des Dionysos-Theaters in Athen und Anderer Griechischer Theater. Von Wilhelm Dörpfeld und Emil Reisch. Athens: Barth & Von Hirst; New York: Lemcke & Buechner.

Dr. Dörpfeld's work has been long expected and will amply repay expectation. It is, first and foremost, the work of an experienced architect and accomplished archæologist, providing his material from actual observation; it is brimful of the latest and most accurate results of well-directed research. The literary records and evidence concerning the ancient theatre have been already collected and sifted thoroughly. The literary record was, in many respects, extremely confused and confusing; the technical terms, defined by Pollux and others, offered many puzzles and apparent contradictions—they were even more puzzling, perhaps, than the problematical mass of ruins from which the remains of the Dionysiac theatre were exhumed; but, by the light of the extant monuments, Dr. Dörpfeld has succeeded in extracting from all sources a reasonable and luminous history of the evolution of the theatre.

The weightiest and most original contribution in Dörpfeld's work is his architectural history of the Dionysiac Theatre at Athens. The extant remains of this theatre presented in themselves a résumé and epitome of all the steps by which, in the course of half a dozen centuries, the Greek theatre was transformed and developed into the Roman type. To disentangle these remains, to determine the date and function of the different structures and foundations, so inextricably mingled, so misunderstood by previous authorities; to construct from them an intelligible and coherent succession of plans, by the aid of the most recent excavations, was the task which our author has reported and summed up in the admirable plates that accompany this volume. The chapters which follow on the evolution and development of the theatre are a series of corollaries from these researches. They are fortified by comparison with the latest discoveries in other theatres in Greece and Asia Minor.

A fragmentary outline of Dörpfeld's views has already reached the public through various channels, but the details, as drawn from the extant monuments and remains, are very convincing and fascinating; they are so coherent, harmonious, and reasonable that they impress themselves strongly, even without the support and authority of an accomplished architect and archæologist. His view, now no longer novel, that the Greek actors appeared not on an elevated stage, but on the floor of the orchestra, is simply a portion of his coherent theory of the historic evolution of the drama and the theatre. Hence a brief sketch of the process of development is necessary to an understanding of the question of the stage.

The germs of the earliest dramatic performance are still to be seen in Greece at the present day. The stranger who visits Megara or Rhodes, on Easter Tuesday, or on any great religious festival, will witness, in one of those native dances which are still kept up by the peasantry, a sort of rehearsal of the earliest form of the chorus and orchestra. The musicians form a centre for the evolutions of the dancers, and for the ring of spectators who range themselves around or avail themselves of any coign of vantage in the neighborhood. The most distinguished personages may be provided with chairs or seats in the front row of the circle. In this familiar scene we have all the elements of the artless performances of the sixth century B. C.—we have the circular orchestra, the musicians who stood upon the steps of an altar or *thymele*, the chorus who sang and danced around them, and the θέατρον, or onlookers, with the προεδρία, or reserved front seats for officials, or magistrates, or persons of distinction. A single actor, or the leader of the chorus, at times mounted the steps of the altar and filled the pauses of the dance with his recitation. It will be an obvious convenience for the spectators if this festive rite can be displayed at the foot of some sloping hillside.

In the fifth century, these primitive and casual arrangements are improved. The State now takes official notice and charge of the performance and the arrangements. The hillside is artificially prepared by foundations of stone and earth for the reception of wooden seats for spectators; the circular orchestra below is levelled and made of beaten earth for the steps of the dancers. The two or three actors stand in front of a wooden building—called scena (σκηνή)—which faces the spectators on the other side of the orchestra, and makes a tangent to its circumference. This building serves as a dressing-room for the actors, and in general for their exits and entrances. It serves also as a background for their performances, being provided with projecting wings on the left and right, between which is set up a movable decorative wall, called a proscenium. The scena has one or more doors through which the actors make their exits and entrances, except when they are supposed to come from the city, or from a distance. In this latter case, they use the same passages (parodoi) which the chorus and the spectators use—passages leading on each side of the scena into the orchestra.

In exceptional cases, the actors make their appearance on the roof of the proscenium, when, for example, they impersonate a deity, or are supposed to speak from the balcony of a house or the battlements of a city. The *locus* of the actors is now transferred from the altar to the scena; they emerge and speak from it (ἀπὸ σκηνῆς), or they stay near and in front of it (ἐπὶ σκηνῆς), but they move freely on the floor of the orchestra. The wall of the scena had three doors, probably; but the proscenium, which masked it, varied according to the scene to be represented. In the heyday of the drama, the period of Æschylus, of Sophocles, Euripides, and Aristophanes, the proscenium is a movable scenic or decorative front of the scena, built of wooden columns with painted panels between. These panels may be shifted so that the proscenium suggests a temple, the walls of a city, a rustic landscape with grotto, a royal palace, a dwelling-house, or a row of dwellings, according to the requirements of the particular performance.

The scena building is one story high, unless the exigencies of the play require the temporary erection of a second story. In the fourth and later centuries, the increasing vogue of Menander and the domestic comedy (which Plautus and Terence represent), imparted a fixed character to the proscenium; it regularly represented the vestibule or façade of a dwelling, or of several dwelling-houses. It could, therefore, assume a permanent type; and it was, accordingly, together with the scena, built of stone, its decorative columns replacing the wooden posts of the earlier shifting contrivance, its height remaining from ten to twelve feet, the width of its roof from eight to ten feet or thereabouts. At this conventional house-front, which is clearly indicated in the remains at Epidaurus and elsewhere, the actors continued to make their exits and entrances. Its doors opened on the street, *i. e.*, on the level of the orchestra, and on this level the actors stood, as in the earlier period.

Such, at least, is the contention of Dörpfeld, and it looks eminently reasonable. It is a logical sequence of the development of the theatre, which we have just lightly sketched. It did not present itself first to him as part of an *à priori* theory, but as an architectural fact among the ruins of the Dionysiac theatre—a fact which was quite unaccountable according to existing opinions. Yet these opinions were based on the distinct statement of Vitruvius, a professional architect writing in or near the time of Augustus, and accompanying his article on the theatre by exact mathematical measurements. In this treatise he expressly states that the Greek theatre had a stage, and that its height was not less than ten nor more than twelve feet; and he seems to say, almost as explicitly, that the actors performed on this stage.

This is certainly a staggering statement, and requires an array of stark facts to controvert it. "It is absurd to suppose," says the article in Harper's recent 'Dictionary of Antiquities,' "that Vitruvius could have made a blunder in writing about the Greek theatre of his own day." Many distinguished French and German Hellenists are struck with this same absurdity. Mr. Haigh, among English scholars, accepts the dictum of Vitruvius, with some modifications which he proposes for the fifth century. Within a few years, the French at Delos and the English at Megalopolis thought they had found crucial evidence in inscriptions and in a stage structure to confirm the Vitruvian prescription. Our American archæologists, on the other hand, have generally supported Dr. Dörpfeld's contention; and among these we have had occasion to notice the useful contributions by Prof. John Williams White and Prof. Edward Capps to the discussion of the evidence afforded by the dramas. The controversy, therefore, be-

came, in an esoteric way, an international question. It would be quite impossible to present even a summary of the array of arguments which Dr. Dörpfeld marshals; but a few of them, after the sketch we have given, will be interesting and perfectly intelligible.

In the first place, assuming Vitruvius to be correct, no one who accepts his statement has ever pretended to explain why the Greeks, who were reasonable and practical people, should have been so absurd as to mount their actors on a narrow shelf, which had to be climbed by a staircase of some twenty steps, and from which they must have talked with the chorus as people call from an upper story of a house to their friends on the next floor below. Dr. Dörpfeld says that this curious, high, narrow ledge *was*, in fact, an upper story, viz., the roof of the proscenium, which an actor did occasionally mount if he was to gaze from city walls or to climb a roof, like the escaping disciples of Socrates in the "Clouds," or to pose as a deity declaiming from the skies. In such rare instances an actor might stand quiet and keep his head, notwithstanding the inconvenience of being hampered with a mask and with high-soled boots; in other instances and for ordinary purposes, Dörpfeld asserts that such a ledge is an impossible position for an actor wearing a mask and using the free and vehement action which experts agree in attributing to the performers in tragedy as well as comedy.

If we ask how could the people see the actors without a stage, Dörpfeld makes a very ingenious and obvious reply. It is simply this: If your spectators sit on a level, a stage of moderate height is necessary; if, on the contrary, they sit on ascending tiers of seats, as in the Greek theatre, a stage is unnecessary, is even undesirable and objectionable. The higher it is, the more objectionable; in fact, for the nearer spectators it will defeat its own object. This is a mere question of optics and mathematics. A moment's reflection and calculation will show that if the stage is ten feet high and ten feet wide, a spectator ten feet away will lose sight entirely of an actor standing at the rear of the stage; spectators at a greater distance are at a less disadvantage, but all spectators near by are inconvenienced by this elevation instead of being helped by it. On the other hand, the rising tiers of seats remove the necessity of such an elevation. The spectator sees over his neighbor's head, and looks down across the wide orchestra with perfect ease and clearness.

Our author offers an ocular proof of this in a photograph taken at the theatre of Eretria. In this view more than fifty people are standing distributed over the orchestra and close to the scena wall. Every one of these is distinctly and separately visible, without crowding or confusion. Perhaps the picture would have been still more convincing if it had been taken from a lower point, with an experimental arrangement of chorus and actors. Only the spectators in the very lowest and foremost row of seats could have any difficulty in distinguishing the actors and the members of the chorus. Even here, as Dr. Dörpfeld observes, the vision is assisted and the distinction made clear by the varied costumes of the actors, and, in tragedy, by the elevation due to the cothurnus.

Another weighty fact, the significance of which has been imperfectly understood, is remarked by Dr. Dörpfeld. The outer boundary of the Roman cavea for spectators forms a semicircle; the Greek cavea is extended beyond a semicircle, in lines which are not a continuation of the original circle, but are struck from new centres, and give an elliptical or horse-shoe shape to the cavea. The object of this arrangement is generally said to be to increase the seating capacity of the theatre, and this is, in some cases, true as far as it goes. But there is another object which is strikingly evident and practical when once pointed out. This arrangement enables the spectators at each end of the horse-shoe to look on without inconvenience; moreover, if we draw and plot out the "lines of sight" for spectators near the extremities (choosing, for example, the actual curves of the theatres at Athens or Epidaurus), we shall find that these lines converge toward points between the centre of the orchestra and the front of the proscenium. The conclusion from this is obvious, viz., that the action must have taken place in front of the proscenium, that the arrangement of the curves was designed to favor the spectators' view of the portion of the orchestra lying between its centre and the proscenium; for a view of the proscenium itself the curve is extremely awkward, and would oblige the sitters to turn half-way round. If, on the other hand, the actors had stood on a stage situated as Vitruvius prescribes, a simple semicircle would have given all the spectators desirable seats and points of view.

It seems an astounding and improbable thing that an architect writing professionally about the theatre, and with the object of giving practical instructions for building, should commit such a mistake. We must, however, remember, says Dörpfeld, that he was a Roman architect writing about Greek theatres. He may never have seen a performance in a Greek theatre; he was familiar only with the Roman type, which always possessed the elevated stage. He had before him undoubtedly plans and dimensions of Hellenistic theatres; his data in regard to these are, on the whole, accurate. But he looked for an equivalent of the Roman stage, and he found it, as he thought, in the Greek proscenium, with its narrow ledge of roofing. The dimensions of this are exactly what he gives for the Greek logeion, or stage. He may have been further misled by the wording of his Greek sources; in these the actors would be said to stand ἐπὶ σκηνῆς, an expression which he would render in Latin by *in scæna*, "on the stage"; whereas Dörpfeld's discussion of the whole subject proves it to mean *close to* or *in front of* the actor's quarters.

The evidence which will induce one to accept this explanation in face of such an authority as Vitruvius must be very weighty and convincing, and, in fact, it is the cumulative mass of all the architectural facts presented in the extant theatres, fortified by the literary testimony of the plays themselves, which Dörpfeld arrays against the Roman writer. Discussed piecemeal and in a scattered way, as they have been hitherto, the word of the ancient architect might seem irrefragable against this or that particular bit of testimony; but the entire mass is so serried, so coherent, that, to our minds, it overbears and countervails the ancient authority completely. It is entirely convincing, though we confess that for years we have maintained hitherto a sceptical suspense. We are the more convinced because this theory fits in satisfactorily with so many facts and illuminates so many obscurities. It fits to a nicety the facts of the extant dramas; it explains such puzzles as the diversity of meaning attached to *thymele* and orchestra, applied to both stage and arena.

Mr. Haigh and others have made an apparently strong point in the evidence of certain vases from lower Italy, which seem to represent scenes from Greek comedy, performed on an elevated stage. They argue that these vases are evidence of the custom, borrowed by the Greeks of Magna Græcia from the mother country. The evidence of this character and of other extant monuments, such as bas-reliefs and Pompeiian wall-paintings, is very fully discussed in an interesting chapter by Emil Reisch. He shows that the kraters from Ruvo, from Bari, and Lentini are really evidence of the local farces or burlesques which were indigenous in lower Italy, and were reduced to literary form more especially by Rhinthon in the fourth century. These "fooleries" were burlesques of tragic subjects, and were performed by actors solely, without a chorus, in local theatres where the spectators sat on a level floor and required the aid of an elevated stage. The same requirements would give rise to the same expedient wherever the same conditions existed; and such conditions might, of course, sporadically have existed in a few spots in Greece proper, though of such places we have no information. The testimony of these vases is therefore good for the region in which they are found, and for the period which they cover, *i. e.*, from the end of the fourth to the second century B. C. The number of steps in the ladder, or staircase, by which the stage is reached is anywhere from four to eight. This again indicates a height approaching that of a Roman pulpitum. The vases have a real interest and value, as recording certain steps in the development of the Italian theatre, which doubtless had its influence on the Roman type. The information from Pompeiian paintings is much less definite and trustworthy. In this case we have to deal with the whim and fancy of the painter and his decorative purpose; when we make allowance for this, we can extract no secure evidence, except such as is supported by architectural facts of the extant remains.

It follows from the sketch we have given that there is no logical connection between the Greek proscenium and the Roman stage (pulpitum). The latter is not derived from the former by the discovery on the part of the Romans that the Greek proscenium was too high and impracticable, and that a platform wider and half as high would be much more convenient. So elementary an observation was not reserved for the Roman mind to make. On the contrary, the Roman stage and all the structural deviations of the Roman theatre are evolved by practical necessity from the simple process of dividing the orchestra, and depressing that portion of its floor which was nearest the spectators. The comedy of Plautus and of Terence—the comedy of domestic life and manners, which is the forerunner of Molière and Congreve and Wycherley—dispensed with the chorus. As soon as the chorus disappeared from the drama, a portion of the orchestra circle became no longer needful for its occupation

and evolutions. The depression of one portion of the floor has for its correlative the moderate elevation of the other part, which becomes the Roman stage. The Roman stage retains for its background the decorative wall of the Greek proscenium. The actors continue to stand in front of this, and in the same general relation to the spectators and the scena building which they originally had in the Greek theatre. The structural peculiarities of the Roman building follow necessarily from this one fact of the disuse and the depression of one portion of the orchestra, and its conversion to other purposes; hence the vaulted passageways leading into this part of the orchestra and to the cavea, and the disappearance or transformation of the original *parodoi*.

The height of their stage is that of the line of sight of the foremost spectators, and is rigidly confined to this reasonable figure. Other structural changes follow necessarily from the roofing-in of the whole building and placing it under cover. The simplicity and the logical necessity of these changes are strikingly shown by some simple diagrams, which illustrate the transition of the Greek theatre proper to the types of the theatre at Aspendus or Assus, and in Pompeii. In Italy, the superfluous portion of the orchestra is devoted to seats for senators and magistrates. In Asia Minor and at Athens it becomes an arena or *conistra* for gladiatorial combats.

A New History of the United States. By Horace E. Scudder. Sheldon & Co. 1897.

Student's American History. By D. H. Montgomery. Ginn & Co. 1897.

History of the United States. By W. A. and A. M. Mowry. Boston: Silver, Burdett & Co. 1897.

About thirteen years ago Mr. Horace E. Scudder published a history of the United States for the use of schools. In spite of occasional indistinctness of outline, and a style rather more elementary than some teachers thought necessary, the substantial merits of the book were soon recognized, and it has continued to hold its own as one of the best of elementary text-books. Mr. Scudder has now published a 'New History of the United States,' modelled, he tells us, on the same general lines as the earlier work, but with fuller treatment and somewhat different emphasis. Perhaps the most distinctive feature of the later volume is its arrangement. All of the history preceding the fall of Quebec is treated as merely introductory, the six chapters occupying less than one-fourth of the text, while the succeeding events are grouped, as in the earlier work, in two periods, with the close of the second war with Great Britain as the dividing line. Two supplementary chapters deal with the preparation in Europe for the discovery and occupation of America, and the physical features of the continent. While the plan, in these respects, is not entirely novel, its advantages, in the way of a rational topical treatment of the subject, are considerable. The human element in the narrative is emphasized by the special attention paid to biography, reinforced by a wealth of portraits. Another notable feature is the frequent reference to poems, novels, biographies, and other pieces of literature illustrative of periods and events; in this respect, indeed, nothing quite so good has yet come to our notice.

The volume is profusely and excellently illustrated, and provided with numerous maps; the illustrative material being reproduced, for the most part, from the earlier book. Finally, Mr. Scudder has equipped his book with a "pedagogical apparatus" of discriminating questions, theme subjects, and topics for debates, besides topical analyses, chronological tables, and a copious index. One does not look for fresh facts or original comments in an elementary manual, and Mr. Scudder has attempted nothing of the sort; he has, however, written simply and carefully, and with an effectiveness which betrays the hand of a practised writer. Altogether, this 'New History' has many points of superiority to any similar text-book which we now recall.

There has certainly long been need of a volume which should do for American history what Gardiner's 'Student's History' has done for the history of England. We cannot think that Mr. D. H. Montgomery's 'Student's American History' has supplied the lack, but the volume is, nevertheless, a useful addition to the small number of commendable text-books in its field. In plan it is similar to the same author's 'Leading Facts of American History,' which has, we believe, met with favor as a text-book for preparatory schools; the present work is larger, however, and covers the subject more in detail. Its merits are clear arrangement, good proportion, and judicious emphasis; its especial weakness is its style, which seems to us to "discount" pretty heavily the literary appreciativeness of the young people who are likely to use the book. The narrative is brought down to the close of Cleveland's second administration. A feature unusual in elementary manuals is the frequent reference to authorities for important statements in the text, although the citations themselves are mercifully transferred to the end of the volume. There are useful appendices and a good index; some of the maps, however, with their solid patches of black and white, strike the eye unfavorably.

A less ambitious, but, on the whole, more successful work is the Messrs. Mowry's 'History of the United States.' It is intended for schools, and, while presenting no points of marked originality, has the merits of simplicity, directness, and balance that one expects to find in a well-constructed text-book, and is worthy of the attention of teachers. The volume is liberally, though not very well, illustrated, and is equipped with useful maps, those in colors being taken from MacCoun's 'Historical Geography of the United States.'

In two respects recent writers of text-books in American history show intimations of relative perfection: their statements are generally accurate, and their sense of proportion good. What they signally fail to do, it seems to us, is to make it appear that the events they narrate were, after all, particularly worth while. In formal construction, as well as in truthfulness and balance, each of the above works has some superior virtues, but neither of them has succeeded in investing the subject with a living interest. The crucial point, of course, is the anti-slavery struggle; and it may as well be said at once that no one is likely to get any vivid impression of the importance of that movement by reading what any one of these authors has to say about it. Mr. Scudder and Mr. Montgomery, in a commendable effort to be impartial, have limited themselves to a somewhat meagre chronicle of events, perhaps with the idea that the teacher will provide the skeleton with flesh and blood; the Messrs. Mowry follow the same course, though less successfully. No doubt a judicious treatment of the slavery controversy, especially in a school-book, offers difficulties, but we are not yet prepared to think them insuperable. The history of the United States shows three great phases—the struggle for territorial possession, the struggle for national independence, and the struggle for moral consistency. Of these three, the last is the greatest; but where is the writer who shall make this clear to American youth?

Citizen Bird. By Mabel Osgood Wright and Dr. Elliott Coues. Macmillan. 1897.

We have here an extremely praiseworthy attempt to teach children about our domestic birds, by encouraging them to observe the living creature rather than the inanimate "specimen" from whom death has taken every personal quality but beauty. Upon the slender thread of a story, in which a naturalist shows some girls and boys how to "name all the birds without a gun," the authors hang a great number of interesting and easily remembered facts, while carefully selecting from our Northern fauna only such birds as are most familiarly seen and easily identified. For instance, in this latitude the fish crow is a not uncommon bird, but hard to distinguish from the common crow, which outnumbers him a thousand to one; the sharp-tailed finch is not unlike the grass finch; the white-eyed vireo is hard to tell from the red-eyed vireo, the black-billed from the yellow-billed cuckoo, and the short-billed marsh wren from the long-billed. So the child is spared the doubt of a perfect identity, impossible to establish with the eye alone, by omitting a discussion of the variation of species, which would tend to puzzle and discourage him. The physiology of the bird and its analogy to that of mammals are simply and entertainingly explained, and all the significance of its life—food, nesting, song, migration—and the especial traits of the various "guilds" of water-birds, tree-birds, sky-birds, and "cannibals," that go to make up "bird citizenship," are exhibited in a manner to bring them within the range of human sympathy. Above all, the book is meritorious in aiming to foster appreciation of the services and beauty of the most amiable and blameless creatures in the animal creation, and to reinforce the protest against their wanton destruction, of which, strangely enough, amiable and blameless women and children are the principal cause. The recent Massachusetts law protecting insectivorous birds from the ravages of milliners is a great step forward; but in the absence of laws suppressing the wide commerce in birds' eggs and skins, which goes on between dealers and boys with "collections," this book has a most useful mission. More than a hundred accurate and spirited illustrations by Louis Agassiz Fuertes add greatly to the attractiveness of the volume.

BOOKS OF THE WEEK.

Brown, A. E. Beside Old Hearth-Stones. Boston: Lee & Shepard. $1.50.
Dolbear, Prof. A. E. Modes of Motion. Boston: Lee & Shepard. 75c.
Dromgoole, W. A. The Farrier's Dog, and his Fellow. Boston: L. C. Page & Co. 50c.

SOME BOOKS PUBLISHED DURING THE LAST YEAR BY

HENRY HOLT & CO., NEW YORK.

FRENCH AND ITALIAN.

Aubert's Litterature Francaise. SECOND SERIES.
Deuxième Année. Dix-huitième et Dix-neuvième Année. Par E. AUBERT, Professor in the Normal College, New York City. xi+290 pp. 16mo. $1.00 net.
Selections from Voltaire, Rousseau, Mme. de Staël-Delaunay, Mme. Roland, Balzac, George Sand, Coppée, etc., with biographical notes in French.

Bevier's French Grammar.
By LOUIS BEVIER, Jr., Professor in Rutgers College. With exercises prepared by THOMAS LOGIE. x+341 pp. 12mo. $1.00 net.
"It is an extremely interesting book."—*Prof. C. H. Grandgent, Harvard University.*
"I am better pleased with Bevier's Grammar than with any American publication on the same subject with which I am acquainted. . . . I shall use the book here."—*Prof. H. A. Rennert, Univ. of Pa.*

Matzke's Primer of French Pronunciation.
By JOHN E. MATZKE, Professor in the Leland Stanford Jr. University. 73 pp. 16mo. 25 cents net
Presents the subject to beginners on the basis of modern phonetics. The book can be used to supplement any grammar.

Balzac's Le Cure de Tours Avec Autres Contes.
With introduction and notes by FREDERICK M. WARREN, Professor in Adelbert College. xiv+267 pp. 12mo. 75 cents net.

Coppee and de Maupassant: Tales.
With introductions and notes by ARNOLD GUYOT CAMERON, Professor in Princeton University. xlviii+188 pp. 16mo. 75 cents net.

Loti: Selections.
Authorized Edition. With introduction and notes by A. G. CAMERON, Professor in Princeton University. vii+185 pp. 16mo. 70 cents net.

Merimee's Colomba.
With an introduction, full bibliography and notes by A. G CAMERON, Professor in Princeton University. New edition, with Vocabulary by O. G. BUNNELL. xv+270 pp. 16mo. 50 cents net.

Sand: La Mare au Diable.
With introduction, notes, and vocabulary by EDWARD S. JOYNES, Professor in South Carolina College. xix+122 pp. 12mo. 40 cents net.

Labiche et Martin: La Poudre aux Yeux.
Comedie en 2 actes. (*m.* 6, *w.* 6.) With notes by Prof. F. BOCHER. New Edition with vocabulary by Prof. BERNARD MAURICE, 90 pp. 12mo. Boards. 30 cents net

Erckmann-Chatrian: Le Conscrit de 1813.
With English notes by F. BOCHER, Professor in Harvard University. New Edition with vocabulary. 304 pp. 16mo. Cloth. 55 cents net.

Erckmann-Chatrian: Madame Therese.
Ou, Les Volontaires de '92. With notes by Prof. F. BOCHER. New Edition with vocabulary. 270 pp. 12mo. Cloth. 55 cents net.

Feuillet: Le Roman d'un Jeune Homme Pauvre.
(The NOVEL.) With English notes by EDWARD T. OWEN Professor in the University of Wisconsin, and FELICIEN PAGET, Professor in the University of California. New Edition, with Vocabulary. 289 pp. 12mo. 55 cents net.

Rambeau & Passy's Chrestomathie Phonetique.
French Reader, with Phonetic Transcriptions. By A RAMBEAU, Associate Professor in Johns Hopkins University, and JEAN PASSY, Professor of Modern Languages in Paris. *American Edition.* xxxv+250 pp. 8vo. $1.50 net.
"It will be a useful book to all those who are trying to teach French pronunciation in a scientific way."—*Prof. C. H. Grandgent, Harvard University.*

Amicis: Cuore.
Abridged and edited with notes by L. OSCAR KUHNS, Professor of Romance Languages in Wesleyan University. vi+217 pp. 16mo. $1 00 net.
Admirably adapted to serve as a first reading book in Italian. It is the record of a school year in Italy, and has been compared to "Tom Brown at Rugby."

GERMAN.

Brandt and Day's Reader in Scientific German.
Selections with notes and a complete vocabulary by H. C G. BRANDT, Professor in Hamilton College, and W. C. Day, Professor in Swarthmore College. 269 pp. 12mo. 85 cents net.
"It seems to me considerably superior to anything of the sort heretofore available."—*Prof. A. H. Palmer, Yale University.*

Goethe: Dichtung und Wahrheit.
Aus meinem Leben Selections from Books I—XIII. Edited with introduction and notes by H. C. G VON JAGEMANN, Professor in Harvard University. With illustrations. xiv + 373 pp 16mo. $1.12 net.

Goethe: Goetz von Berlichingen.
Romantic historical tragedy in prose. Edited with an introduction and notes by FRANK P. GOODRICH, Professor in Williams College. xii + 170 pp. 16mo. 70 cents net.

Eckstein: Preisgekront.
Eine neitere Geschichte. *Authorized Edition*, with introduction and notes by CHARLES BUNDY WILSON, Professor in the State University of Iowa. 16mo. ix+83 pp. Boards. 30 cents net.

Gerstacker: Irrfahrten.
Edited with notes by M. P. WHITNEY, Instructor in Modern Languages in the Hillhouse High School, New Haven. 145 pp. 16mo. 30 cents net.

Wenckebach's Deutsche Sprachlehre.
Von CARLA WENCKEBACH, Professor in Wellesley College. xx+404 pp. 12mo. $1.12 net.
Easy lessons for beginners somewhat younger than those planned for in the *Deutsche Grammatik.* The lessons proceed very slowly, with every effort to be clear and simple.
"I am delighted with the book. . . . It seems upon examination to be just the kind of Grammar I have been looking for."—*Frida von Unwerth, Central High School, Kansas City, Mo.*

Whitney's German and English Dictionary.
New and cheaper edition. 538+362 pp. 12mo. Retail price, $1.50.

ENGLISH.

ten Brink's History of English Literature.
By BERNHARD TEN BRINK. Volume II. Part 2. From the Fourteenth Century to the Death of Surrey. Edited by Dr. Alois Brandl. Translated from the German by L Dora Schmitz. Large 12mo. 309 pp. Retail price, $2 00.
"A finer instance of the combination of artist and scholar, of man of letters and erudite person, is rarely met with."—*The Athenæum.*

In the "English Readings Series."

Browning: Selections.
Lyrical and dramatic poems. With the essay on Browning from E. C. STEDMAN'S "*Victorian Poets.*" Edited by EDWARD T. MASON. 275 pp. 16mo. 60 cents net.

Burke: Selections.
Chosen, and edited with a full introduction, by BLISS PERRY, Professor in Princeton University. 298 pp. 16mo. 60 cents net.

Wagner's Modern Political Orations (British).
Edited by LEOPOLD WAGNER. xv+344 pp. 12mo. $1.00 net.
A collection of some of the most notable examples of the political oratory of the present reign. Includes Brougham on Negro Emancipation; Fox and Cobden on the Corn Laws; Bright on the Suspension of Habeas Corpus Act; Butt and Morley on Home Rule; Gladstone on the Beaconsfield Ministry; Parnell on the Coercion Bill, and others by Beaconsfield, Russell, Randolph Churchill, Chamberlain, Macaulay, Bulwer-Lytton, Cowen, Bradlaugh, McCarthy, etc., etc.

The Johns Hopkins University.
BALTIMORE.

Announcements of the Graduate, Medical, and Collegiate Courses for the academic year beginning October 1, 1897, are now ready and may be had on application to the Registrar of the University.

COMPLETE INDEX TO LITTELL'S Living Age. About a hundred thousand references under Subject and Author Titles. In 2 volumes, $10 each to subscribers. Vol. 1 (1844-1869) mailed anywhere on receipt of price. Vol. 2 (1869-1896) ready for printer, and may appear in 1897.
E. ROTH, 1135 Pine St., Philadelphia.

The Nation.

NEW YORK, THURSDAY, AUGUST 26, 1897.

The Week.

Speaker Reed's suggestion that the discriminating duty in the Dingley bill on foreign goods brought into the United States by Canadian railways "slipped in unnoticed," as such things are likely to do, leads the Richmond *Dispatch* to remark that when such slippings take place somebody usually gets paid for them. This is certainly a wise thought, and it suggests as one of the earliest duties of Congress that an investigation be promptly ordered into this matter. Here is a clause involving millions of dollars and bringing about a change of the policy of the Government on a matter of grave importance—a clause that nobody hears of till the bill is passed and signed—a clause that could not have been passed if it had been publicly introduced and debated. Is it likely that such a provision was introduced clandestinely by a clerk after the bill had left the hands of the conference committee? It is much more likely that it was introduced by some responsible person or persons with full knowledge of its purport and consequences. Whether it was paid for, as the Richmond paper conjectures, is a thing to be found out if possible. At all events it is the duty of Congress to investigate the whole subject. We shall expect to find Speaker Reed and Chairman Dingley especially eager for an investigation, since their State and their section of the Union are hit hardest by this clause of the bill. The public can form some judgment of the facts by observing which members of the House, if any, oppose an investigation. If it is a fact, as Speaker Reed suggests, that the clause "slipped in," it will be very easy to find out how it slipped in. If it did not slip in, but was bought in, its origin and progress will be more difficult to trace. We trust that no apprehensions of lending aid to Bryanism and 16 to 1 will be allowed to stand in the way.

While it may not be easy to find out how the clause slipped in, nobody can have any doubt who caused the slipping. The "slippers in" were the Pacific railroads. The competition of the Canadian Pacific has been a grievance to them for a long time. They have asked Congress more than once to relieve them of this competition. New England has always been "up in arms" against such relief, and has always defeated it. Now it has been carried by stealth, to the extent of at least excluding Chinese and Japanese goods imported by way of Vancouver. The clause that was "slipped in" says that "a discriminating duty of 10 per centum ad valorem, in addition to the duties imposed by law, shall be levied, collected, and paid on all goods, wares, or merchandise . . . which, being the production or manufacture of any foreign country not contiguous to the United States, shall come into the United States from such contiguous country." This is so plainly an attempt to cut off Chinese and Japanese trade by way of the Canadian Pacific that it is impossible to imagine that it "slipped in" without design on the part of some important person or persons. The question whether a lot of money slipped into somebody's pocket simultaneously is the only thing open to doubt.

There is a remarkable hurrying and scurrying among the silverites in the West. The fall of their favorite metal and the simultaneous rise of wheat are the real cause of the sudden activity of the anti-Bryan Populists. This faction, sometimes called Middle-of-the-Road men, are building their hopes of controlling the Populist party on the fact that Bryan's predictions about wheat and silver have been falsified. So they tell their fellow-Populists that the silver question is not the main thing to be considered. The real issues of the time are railroad freight charges, government by injunction, and the "money power." It seems that the last-named monstrosity is working its way westward with rapid strides, and is likely to settle down in the centre of Nebraska, for, according to the Omaha *Bee*, the increased crops of that State this year, together with the increase of prices, will bring the farmers of the State $96,000,000, being a gain of about $19,000,000 as compared with last year. When the "money power" becomes firmly entrenched in central Nebraska, Mr. Bryan can return to his original vocation of reporter for the local newspapers.

Very few States hold elections this year, and in more than one of these there will be no life in the contest, because the overwhelming triumph of one or other party is assured—Republican victory being certain in Massachusetts, for example, and Democratic in Virginia, while in New York a judgeship of the Court of Appeals is the only office at stake. In but three States will the canvass be watched with national interest—Ohio, Kentucky, and Iowa. The meeting of the Republican convention in Iowa on August 18 really opened the campaign there. Eight years ago the Republicans lost the governorship, for the first time since the party came into power before the war; two years later they were beaten on the State ticket again; and in 1892 they had to work very hard to give Harrison 22,965 more votes than Cleveland, although the Populists ran a separate ticket which had 20,594 supporters. A succession of Republican victories during the next three years did not prevent Iowa's being considered again a doubtful State last year, although the Sound-Money Democrats finally gave McKinley a plurality of over 65,000. Long as it yet is before election, it already seems clear that the opposition to the Republicans stands no chance whatever of success. Moreover, as Iowa is typical of the wide belt of great States now commonly known as the Central West, the conditions which obtain there seem to be characteristic of a large section of the nation, and to indicate the result that might be expected if elections were to be held generally next November. The chief feature of the situation is the utter demoralization of the old Democratic party.

The movement for fusion between the Bryan Democrats, the Populists, and the Silver Republicans in this year's campaign in Iowa broke down as soon as the three State conventions met a few weeks ago. The similar movement in Bryan's own State appears to have collapsed ten days before the assembling of the conventions on the 1st of September. County conventions, for the choice of delegates to their State convention, have been held by the Populists throughout Nebraska, and a majority of them were controlled by the "Middle-of-the-Road" element, which believes in "going it alone." With a hearty union for "Nebraska's favorite son" the fusionists gave Bryan last year less than 13,000 plurality over McKinley. With anything short of an effective fusion by the opposition the Republicans seem certain to carry the State easily this year. The troubles which Bryan encounters at home are the same as in Iowa and other States. On the one hand, there are in Nebraska, as elsewhere, a considerable number of voters who honestly believe in the principles of the Populist party, and who see that the Democrats with whom they acted last year really care nothing for those principles. On the other hand, there is a large body of men who voted for the Bryan ticket last year because times were hard, and they were ready to support almost anything in order to get a change, but who now find that a change for the better has come without Bryan's election. Neither of these elements is any longer open to the arguments which were used with effect upon them last year.

The position of the Hon. Horace Boies on the silver question has been the subject of painful doubt for several months. In the campaign of last year he was a supporter of Bryan and 16 to 1. About the time that candidates for the governorship of Iowa began to be talked of this year, the rumor got abroad that Mr. Boies, although still a Bryan man, was no longer a 16-to-1 man, whereupon his name was dropped from the list of candidates, to his own contentment, it was said. The rumor proves true, for in the course of a speech at Marshalltown on Thursday evening, Mr. Boies solemnly renounced his belief in 16 to 1, and declared himself in favor of the Windom plan of bimetallism, of which he gave the following definition:

> "Issue Treasury notes against silver bullion at the market price of silver when deposited, payable on demand in any such quantities in silver bullion as will equal in value at the date of presentation the number of dollars expressed on the face of the notes at the market price of silver, or in gold at the option of the Government, or in silver dollars at the option of the holder."

For example, if a man had deposited 1,000 ounces of silver bullion at the Treasury a fortnight ago under the Windom plan, he would have received approximately $550 in Treasury notes. Then suppose that the notes were presented for redemption a week later, silver having declined say 3 cents per ounce. They would be redeemable in whatever quantity of silver bullion $550 would buy, *i. e.*, about six per cent. more bullion than the Government received. Fortunately, it has a supply from which it could make up the difference, but the Government could redeem the notes with $550 gold if it should prefer to do so, or the holder of the notes could demand $550 in silver dollars. While this plan speaks volumes for the honesty of Mr. Boies, who abhors the cheating that would result from the 16-to-1 plan, the difficulty of making its operation clear to the common understanding will probably prevent its ever becoming popular during his lifetime.

The Republican party of Virginia is in a melancholy condition. Although it came within about 19,000 votes of carrying the Old Dominion for McKinley last year, the State executive committee met last week and decided not to nominate any ticket for the State election this year. The committee also deposed the late chairman, but he contends that the meeting was illegal, and says that he shall call a State convention next month. Whether he does or not is a matter of no consequence to the Democrats, as the other Republican faction would not support his ticket. The trouble grows out of squabbling over the patronage, and is an impressive lesson on the hopelessness of building up a party in any State with federal offices.

Comptroller Eckels's address at the bankers' convention at Detroit last week was a strong restatement of the reason why the Treasury should take itself out of the banking business by retiring its circulating notes and restricting itself to its proper function, collecting and disbursing the money needed for the Government's expenses. He quotes among other things the vigorous protest against the legal-tender act made in 1862 by Mr. Justin S. Morrill, now Senator and then Representative from Vermont. This recalls the fact that Mr. Morrill and Mr. Sherman were both in Congress when that act was passed, that both have been continuously in public life since that time, and that both have been leaders of their party in matters relating to finance. Mr. Morrill opposed the legal-tender act, and voted against it. Mr. Sherman favored it and voted for it. Mr. Morrill has been in favor of every measure that has been before Congress since that time to retire the greenbacks, and Mr. Sherman has opposed every such measure. Mr. Morrill is certainly as good a Republican as Mr. Sherman and as much entitled to the confidence of his party. Yet every suggestion that the greenbacks be retired is treated by some persons as a sort of party treason. We commend to their attention the example of the venerable Senator from Vermont, "Father Morrill," as he is sometimes called, who pronounced maledictions on the greenbacks thirty-five years ago, and has never retracted a word that he then said about them.

The law as to injunctions and contempt of court for their violation was laid down by Judge Goff of the United States Circuit Court very clearly at Clarksburg, W. Va., on Saturday in the cases of some miners who had been arrested and lodged in jail for disregarding the famous injunction order issued by Judge Jackson. Judge Goff pointed out that the simple question was whether the defendants were in contempt of court, and declared that, if they were aware that the court had passed the decree granting the injunction, and were aware of its terms and import, and if they interfered with or intimidated the employees of the coal company, thereby preventing them from getting to or from their work or causing them to abandon it, then they were guilty of the contempt charges, and should be, must be, and would be punished. He reviewed the evidence, and showed that the body of strikers to which the defendants belonged had really interfered with the work at the mines, and intended by their demonstrations so to interfere. They knew of the injunction, and, when it was read to them, some of them replied, "We will take the consequences." There consequently could be no doubt of their guilt; but as the Judge considered them thoroughly honest in their claim that they had the right to march and act as they did, because they were on the "public highway," he let them off with three days' imprisonment apiece; but he served warning that, if others should follow their example after the law had been laid down, they would be severely punished.

Judge Goff cleared up one point which seems to have puzzled some people who had less excuse for confusion over it than the ignorant miners. This is the assumption that a body of strikers have the right to make almost any sort of a demonstration, provided the scene of it is the "public highway." In this case over 200 men assembled before daybreak, marched along the road until they came opposite the opening of a mine, and then took possession of the highway on each side for a distance of at least a quarter of a mile, at the exact places where the miners were in the habit of crossing that highway for the purpose of going from their homes to their work. The striking miners seemed to think that they could go and come on and over the country road as they pleased, because it was a public highway, but the Judge declared that this was a mistake, since the working miners had the same right to use the public road as the strikers had, and it was not open and free to their use when it was occupied by over two hundred men stationed along it at intervals of three and five feet. As a matter of fact, it was shown that some of the miners who wanted to work were deterred from doing so because they were afraid to pass through this hostile line. To say that such interference with the rights of laborers must be permitted because the offenders conduct their operations in a public highway, would be to throw the influence of the public on the side of disorder.

The Mississippi judiciary seems resolved to do its full duty in the matter of lynching. Three judges took occasion in opening court week before last to enunciate their position most clearly and emphatically. Judge Sykes at Corinth declared that mob law must be stopped, or government would prove a failure; law and order must prevail, or the mob would rule in everything. Judge Powell at Raymond called the attention of the grand jury to the recent hanging of a negro by a mob in that county, and instructed them to inquire diligently into it and, if possible, indict those who participated in the mob. Judge Cassedy at Monticello portrayed the horrors of lynching, showed clearly the effect which utter disregard of the law would have on the community, and said that to take the life of a fellow-creature, except in necessary self-defence or by due process of law, is cold-blooded murder. Coming

down from generals to particulars, he referred to the pending case of a negro accused of a grave crime, and threatened with vengeance, announced that he was sworn to protect the life and limb of every man on trial in his court, and declared that it was his intention to give the negro a fair and impartial trial, cost whatever it might, and that no mob could get him unless they first walked over his dead body. Nothing could do more to bring people to their senses and put an end to the craze for lynching than such words from the bench. We are glad to observe, by the way, that the recent accusation against an Alabama judge of using most improper language regarding "a white man's country and a white man's court" is disproved, and that what Judge Banks really said during a trial at Decatur was approved by both races.

Nothing affords stronger evidence of the popular strength of Mr. Low's candidacy than the straits to which it puts Tammany for a candidate. All the Tammany leaders realize that somebody not closely identified with the organization in the past, and somebody of irreproachable personal character, must be found to run for Mayor. What is wanted is a man who will draw independently-disposed Democrats away from Mr. Low—that is, a man who will give assurance that as Mayor he would be as desirable an official, from the point of good city government, as Mr. Low would be. The latest possibility in this direction is said to be Judge Van Brunt. A short time ago it was Judge Morgan J. O'Brien. It is extremely doubtful if either one of these men would consent to stand. Both prefer the bench to politics, and would be most reluctant to leave it. Aside from them Tammany has not been credited with thought about anybody as a candidate who could be looked upon as meeting the exigencies of the situation. If by any possibility Mr. Low were to be removed from the field, we should see at once a decided lowering of the present Tammany standard of availability, and the difficulty of finding a Tammany candidate who should give reasonable assurance of election would be greatly lessened.

The anxieties of the English Government over the situation in India will undoubtedly be increased by the conflicts on the frontier. But the more serious causes of concern had come to light before, and are independent of the movements of the tribes to the north, however formidable these may for a time appear. Armed incursions and revolts the Indian Government can face with confidence, but what is it to do to allay the sullen dissatisfaction and growing sense of unrest within the empire itself? That was the really alarming feature of the recent cold-blooded assassination of the English officials, Rand and Ayerst. There was no personal grievance to be avenged, but a blow was to be struck to show the settled discontent of the natives with British rule. This discontent has been nursed by a form of political agitation which has been in existence in India for ten years or more, and which is now more threatening than ever. It is organized in native associations, led for the most part by educated young men, which have for their fundamental object the redress of the intolerable grievances which, it is alleged, the inhabitants of India suffer from the viceregal government. With a vernacular press of growing power and recklessness to foster the agitation, with native congresses becoming popular, and the demand for a certain measure of home rule becoming loudly advocated, the elements of a serious internal disturbance are evidently present.

It should not be forgotten that the troubles of the British on the India frontier are greatly heightened by the Government's determination to retain Chitral. When the Indus was the frontier, a disturbance among the independent tribes beyond was easily dealt with. All the military authorities had to do was to close up the outlets of the valleys of the offending tribe, shut their markets to its traders, and wait quietly till it submitted or till a convenient time came to send out a punitive expedition. But now the situation is entirely changed. Small bodies of natives or mixed troops are pushed up hundreds of miles beyond the main line of defence. Their communications are subject to attack by any one of a long succession of tribes; transportation is difficult and costly, and the time for fighting is chosen to suit the convenience of the tribesmen, not the British officers. But for this new phase of the problem, the mobilization of 35,000 troops on the frontier would not have been necessary. Their presence is demanded not so much for actual fighting as to hold the country, to protect communications, to support and relieve the garrisons. This is really the direct result of the decision to hold on to Chitral, after the Indian Government had announced that the object of going there was simply to make a demonstration in force and then retire.

The Sultan has the Powers dead-locked again, it is reported. Nobody can remember how many times he has had them so before. It is an old game for him and he knows its every move. For four years, 1878-1882, he stolidly faced the same Powers, and finally carried his point. The Congress of Berlin, it will be remembered, handed over to Greece not only Thessaly, but also a large slice of Epirus. But the Turk refused to surrender Epirus. He took to "negotiating" instead. He negotiated with such skill that in the end the Powers were completely fagged, and said, "Well, then, keep Epirus." This final settlement was not effected till November, 1882. At that rate, the negotiations about Thessaly will be going on earnestly in 1901. The Sultan is plainly preparing to tire out Europe again. Moreover, he clearly perceives the inherent weakness of the Concert of Europe. As a writer in the *Fortnightly* points out, the Concert was never framed either to resist or to coerce the Sultan. It had and has no such mandate. It originally came into being in 1894, on the initiative of Lord Kimberley, to inquire into the Armenian massacres. Then it was continued for the purpose of urging "reforms" upon the Sultan. He reformed cheerfully, at their request, but the more he reformed the more he was the same old reprobate. Then came the Cretan troubles and the war with Greece, with each of which the Concert showed itself wholly unable to cope. So it apparently is now with the settlement of the terms of peace. The Concert was not created for any such purpose, and is a most bungling instrument for the end in view. The Sultan pretends to submit to the Concert, but then makes some proposition which hopelessly divides the Concert, and shows that it is nothing but a committee of disagreeing members. In that guise it stands to-day.

While "dollar wheat" is presumably making all Americans rich and happy, it seems to be filling the French with great alarm. Where are they going to get their bread? If the present high prices of flour go higher, what will the consumer do? This question does not, of course, trouble us here in the United States, because, if flour goes up a dollar a barrel, we have a benevolent President to increase our wages and salaries and profits correspondingly, so that we pay the difference without knowing it. But M. Méline, though as ardent a protectionist as Mr. McKinley, has not been able to make *his* tariff bring general prosperity; hence the complaints about dear bread, coming from the artisan class. It has occurred to the anxious consumers to appeal to M. Méline, at this juncture, to reduce the import duties on wheat, or if not on wheat at any rate on flour. But to do so would be little short of an outrage on the French farmers. Their grain duties, in ordinary years, are only less of a humbug than are our own. Like ours, they are meant only to fool the farmer. But now that an unnatural scarcity promises to make them really effective, it would be the very suicide of protectionism to lower them. When nature comes to the help of man and makes the necessaries of life scarce and dear, it would be very like flying in the face of Providence to try to bring food within the reach of needy millions by repealing a protective tax.

HARVESTS AND POLITICS.

Not least interesting among the advices from the grain-producing districts have been the brief announcements of the failure of one or two Populist conventions. These political gatherings were duly convened; the chairman and the secretary were on hand, and two or three of the professional Bryanite barnstormers of last summer were in sight when the doors were opened. But nobody else put in an appearance.

We shall hear much more of this sort of news between now and the sowing of next season's winter wheat crop. This indifference of the farmers will, without any question, play its part in next autumn's elections in the Mississippi and Missouri valleys. The overwhelming break in silver, along with a rapid advance in wheat, is an important object-lesson in itself, but political developments would probably be the same even if silver had advanced with wheat. The chief factor in the situation is better times in the grain-growing States, without any tampering or experimenting with the standard of value.

The farmers of Kansas, who gave Bryan a plurality of 12,269 last November, and the farmers of Nebraska, who gave him a plurality of 13,470, were neither born agitators nor dishonest citizens. The very great majority of this Bryan vote was cast by people who had not the slightest comprehension of the free-coinage issue. But their own situation was really deplorable—partly, it is true, through their own mismanagement, but largely also through the accident of nature; and with the proverbial tendency of unlucky people, they were disposed to put the blame anywhere except where it properly belonged. Let us notice exactly what was the state of things. Nine years ago, when the country as a whole yielded a heavy crop of corn, these two corn-growing States produced an average harvest. In 1890 came one of the periodical crop shortages abroad; another followed it in 1891. The result was that the price of corn rose 50 per cent., and in 1891 a crop of exceptional magnitude was sold at this advance. Very much the same experience happened with wheat, of which crop also a good deal is produced in Kansas and Nebraska. The result was that all Kansas and Nebraska went to work raising wheat and corn. This of itself was a natural and proper sequel to the movement of the markets; but unfortunately a large part of the increased acreage was undertaken on the basis of borrowed money, as a speculation. Still more unluckily, these borrowings were largely based on the prices of 1890 and 1891. With 80-cent wheat and 60-cent corn produced in plenty through the succeeding years, these farmers would have come out ahead on their speculation; without such a result, some at least of them were doomed to certain ruin.

No more disastrous speculation was ever undertaken by an industrious community. To begin with, all the other arable land of the Western States was turned into farms of the same two staples. Between 1885 and 1891, the planted area of corn in the entire United States increased 3,000,000 acres; the area of wheat nearly 5,000,000. Inspired by the high European prices of 1891, foreign producing states made similar enlargement of their acreage. The Danube countries and the Argentine Republic began to raise and export even corn. The crops of Kansas and Nebraska increased rapidly; but the price of corn at farm declined from 50½ to 36½ cents a bushel, and this, though a plain commercial consequence, was very far from what the borrowers on farm mortgages had looked for. It was an easy theory to set up that the "money power" of the East was grinding the farmer under the weight of intolerable charges. But it very soon became manifest that the bargain was as bad for the lenders as for the borrowers. In 1893, half of the largest farm-mortgage companies doing business in Kansas and Nebraska failed, and holders of their debentures were left in as sorry straits as the farmers who had used their money. To cap the climax, the corn crop of 1894 in these two States was almost completely ruined by drought. Kansas, which produced 139,450,000 bushels in 1893, had in the next year less than 42,000,000 to sell. Nebraska's production fell from 157,000,000 bushels to 13,800,000. The price of corn advanced, of course, on this wholesale devastation; but the advance made little difference to the Kansas-Nebraska farmers.

Events such as these in the agricultural States were doubly unfortunate from their coincidence with the commercial break-down in the East, and with the collapse of the national finances under the three reckless laws passed for the revenue, the expenditures, and the currency, by the Congress of 1890. The rise of the Populist party had its origin as plainly in these misfortunes to the farmers as the fiat-money craze in 1874 and the free-coinage movement of 1878 had their birth in similar phenomena. In 1874 the grain markets were congested by enormous wheat production, at home and abroad, exactly as they were twenty years later. Ohio and Indiana, then the central wheat-producing States, became known as the "hotbeds of inflation." In 1878, largely because of the new acreage in Kansas, Nebraska, and the Northwest, our wheat and corn production rose far beyond any previously recorded. But the crops of the outside world equally passed their previous maximum; cereal prices declined rapidly, farm mortgages ate up all the profit of speculative farmers, and in the fall of 1878 the wheat-producing States were either barely carried for the sound-money administration, as in the case of Ohio, or went for the opposition on the most extreme financial platforms, as with Michigan and Kansas.

The remarkable similarity between the agricultural situation in 1879 and the situation now, following, as the developments in both years have done, a long season of enormous world-wide production, low grain prices, and embarrassment of farmers who had rashly contracted debt, will lend peculiar interest to political events this autumn and next year. Paper-money inflation was killed by the harvest of 1879, happily coinciding with resumption; free silver disappeared as an issue for nearly a decade. In the Presidential election of 1880, the Greenback ticket received in Kansas only 19,851 votes out of 201,226, in Nebraska only 3,950 out of 87,452. It is reasonable, in the light of all experience, to look for a similar result this coming year. If, as fortunately seems to be indicated, the farmers use their present profits, not as a basis for new debt, but as a means of acquiring actual ownership, we shall hear little of Populism for a long time to come. The price of wheat to-day stands 40 cents per bushel above its price a year ago. Current reports of injury to the Northwestern wheat may affect, in some measure, the actual total product, but the most recent commercial estimates predict that the Southwestern group of wheat-producing States, including Kansas and others which rolled up a heavy Bryan majority last November, will this year harvest, in face of the great advance in price, 95,000,000 bushels, against only 59,000,000 in 1896.

THE STRIKE INJUNCTIONS.

The peacefulness of the great coal strike, which has now been going on for several weeks, has attracted universal attention, and no one will grudge the miners the credit they have got for it. Their quiet attitude is all the more creditable to them because a certain portion of the press have done their utmost during the whole period to incite the men to violence—not, indeed, deliberately, but with that irresponsible recklessness which is equally dangerous. If they have not misrepresented the orders of court which have been issued, they have denounced the judges issuing them with a violence of language eminently calculated in a time of disturbance to incite to resistance to the law. One paper suggests that Judge Jackson be impeached; another calls for a "severe example," and denounces his action as "tyrannous," declares that the acts of "men like Jackson" are doing more to bring the discontented into "hot antagonism" to the established order than "most other causes put together," and

that Judge Jackson's order is "as gross a usurpation of power as any ever recorded in the annals of tyranny"; a third insists that it is superfluous to discuss the question at all, and a fourth declares that the strikers have been denied a right "inherent in American citizenship." The newspapers in which we find this extreme language are not strike organs, but the Chicago *Inter Ocean*, the Springfield *Republican*, and the Boston *Herald*. We shall not waste time in arguing that the general drift of such words at such a time is provocative in a high degree. If any one who sympathizes with the oppressed doubts it, let him ask himself how he would feel if he believed that the description of what the courts were about was true.

In the multiplicity of injunctions which have been granted, it would be very strange if some mistakes should not have been made, which, however, are always subject to correction by the court on cause being shown, and it is utterly impossible to discuss such a matter wholesale. At the time of the Debs injunction in 1894 we expressed the opinion that resort to courts of equity by the Government of the United States to suppress disorders connected with strikes was a mistake, and many of our readers no doubt shared the feeling that the sheriff, and police, and troops were the proper remedy; but when this very argument was addressed to the Supreme Court, the judges unanimously said that it could have no force with them, whether it was sound or not, because they were appealed to, in a case where the jurisdiction was clear, to issue a writ which they had no right to deny; and any one who has not a very low opinion of the Supreme Court must believe that the judges acted upon a conscientious conviction that they could not do otherwise than they did, for at least four of them, with Judge Harlan at their head, were known to have strong leanings against straining the law in favor of corporate and "monopolistic" wealth.

Of all the recent important decisions of the Supreme Court, we know of none which shows greater deliberation and sense of responsibility, and none which is plainer in its statement of principles, than the Debs case. Although it related directly to a railway strike, it covered the whole ground of injunctions against acts constituting interferences with property rights, both in the State and federal courts, and it constitutes, and was intended to constitute, a permanent guide for the action of inferior courts. That it will be followed there is no room for doubt, and those who wish to advise strikers should study it, not rave about inalienable rights which have no existence. Until the Populists have their way and destroy the Supreme Court, it is the law of the land, and it is probably because it is the law of the land that the present strike is so peaceable.

It should be borne in mind that to say in advance what specific acts may be enjoined in a strike and what may not is utterly out of the question. In the Debs case (158 U. S. 564), the case made by the bill was forcible obstruction of interstate commerce; the jurisdiction of the court was rested on actual or threatened interference with property or rights of a pecuniary nature, the same ground which is appealed to every day by private individuals in the case of nuisances and trespass. It was objected that it was outside the powers of a court of equity to restrain the commission of crimes. In reply to this, the court said that the power to prevent injury to property was not affected by the fact that, if not exercised, crimes might ensue (p. 593); and this, as anybody may satisfy himself by looking at the cases cited by Judge Brewer in his opinion, is no novel federal assumption, but well-recognized law in the State courts. The injunction, in that instance, was very broad, since it enjoined the strikers from entering on the railroad premises, from attempting to induce employees of the railroads to "refuse or fail to perform any of their duties," and from threats and intimidation, whether for the purpose of inducing employees to leave the railway service or of preventing others from entering it. To sum up the whole thing, what the strikers and their leaders were trying to do was to bring the railroads to a standstill. On the ground of threatened irreparable injury to the pecuniary rights of the United States in the transportation of the mails, every conceivable act in furtherance of the conspiracy was enjoined, even acts which under ordinary circumstances would have been lawful.

The important thing, it seems to us, is that everybody in the United States should understand that the violence and disturbance of former strikes have led, not to the introduction, but to the wide application, by the courts of a remedy which paralyzes the arm on which strike-agitators used to rely, because it brings within the reach of every property-owner in the United States who sees his workmen banded together to stop his work, and who can satisfy a judge that he is really in danger, a local preventive constabulary, which forbids whatever acts or deeds the judge deems dangerous, under penalties for disobedience which no man or body of men can safely face. Such is the law, and, in our opinion, the remedy will continue to be applied until the fears of the property-owning class cease to be acute. That can only be when the courts are persuaded that the dangers apprehended do not exist, and when that time comes there will be no more applications for strike injunctions. Meanwhile, to our minds, what is needed is not tirades against them, but a thorough comprehension of what the law is.

THE KEY TO GOOD FOREIGN RELATIONS.

A Chicago dispatch reports that Mr. Northcote, a son of the late Lord Iddesleigh, living in that city, has given out the opinion that the real attitude of Americans towards England is one of "indifference." He thinks that the majority of Americans consider England an "effete monarchy," but at the same time believes that the interests which the two countries have in common will always prevent a serious quarrel.

For two or three years past the English press has teemed with articles on the attitude and temper of America, and the question whether America hates or loves England; yet, so far as we have observed, the question is no nearer solution now than it was at first, and we doubt if Mr. Northcote's solution is accepted by anybody. The tremendous anti-English excitement which was cooked up for two months over the Venezuelan boundary would not have been possible had Americans in general regarded England with indifference. That no considerable body of Americans consider England to be an effete monarchy, can be proved in black and white by reference to the thousand and one articles on the Jubilee in the American press; while, of course, it is merely begging the question to say that common interests must necessarily prevent a serious quarrel. They may, and then again they may not.

While we ourselves believe that a war between the United States and England would be such a monstrous calamity that it is impossible to conceive of either country deliberately entering upon a policy with war as an end in view, it is absurd to pretend that the relations between the two countries may not be severely strained, or that war is out of the question. They were severely strained during the civil war; they were severely strained during the long discussion over the *Alabama* arbitration after the war had ended; while the Venezuela dispute, and in a different way the seals correspondence, go to show that there are causes of irritation between the two countries which are likely at any time to break out and produce trouble, and at least an angry exchange of abuse in the newspapers, all of which is deplorable in itself and leaves behind the seeds of further misunderstanding.

But it must be evident to any one who looks at the matter dispassionately that no amount of inquiry as to the "real feeling" of America for England, or discussion whether it is indifference or hate, or a mixture of both, or love or good will, or a keen sense of a community of interest, throws much light on the possibilities which such troubles may have in store for us. The political dealings of the two countries with one another are not carried on, as their business is, by the nations at large or

the individuals who compose them, but by a small number of selected representatives—the President and Congress on one side and Parliament and a cabinet on the other, and during most of the time by the Secretary of State here and the Minister of Foreign Affairs in England. In fact, when Congress and Parliament are not in session, these two persons have the whole business in their own hands.

Behind these representatives stand two nations of the same blood, both fond of money and land, both adventurous and combative, and both having a profound belief in themselves and an inherited tendency to attribute acts of national aggression and violence to very lofty motives. Under such circumstances, whatever may be in doubt, one thing that is clear is, that the relations and state of feeling between the two countries must depend, in the main, not merely on the sentiment which animates one people or the other, but primarily on the behavior of these selected representatives or agents who carry on their business. The very fact that they are selected representatives and trusted agents shows that, unless there is something very extraordinary about their behavior, they will generally be "backed up," whatever the consequences may be, by the body of the people behind them. The people of this country, for instance, backed up Mr. Cleveland in his Venezuela ultimatum, with little or no understanding of the merits of the matter or of the meaning of the "Monroe Doctrine"; and the people of England, and even the Opposition in the House of Commons, are to-day "backing up" Lord Salisbury in a European foreign policy the ultimate purposes of which hardly any one professes to understand. This is partly a necessity of the case, arising out of the fact that foreign business, unlike domestic politics, is still carried on with mediæval secrecy, until the occasion comes when the agent thinks fit to reveal what he has been doing.

Consequently, the great desideratum for a good understanding between America and England is less an inquiry into the sentiments which animate the two peoples than the most careful selection of the men who are to carry on this vastly important and secret business, for it is on their character that the relations of the countries depend. One constant cause of misunderstanding with England at present arises from our attempt to treat this fact as if it did not exist. When Mr. Sherman was selected for Secretary of State, the question of his mental competency was raised at once by the correspondents, and there were plenty of persons who knew him to be out of the question; but no attention was paid to this by the appointing power, and the "shirt-sleeves" dispatch was the result. Now, we venture to say that the idea that this could be the explanation of that extraordinary communication never entered the head of any Englishman in public life until we in this country let the cat out of the bag. It did not enter their heads, because such an appointment could not be made in England. For two generations the habit of considering fitness the first test in appointment to office has become so ingrained in the English mind that it is very difficult for English people to imagine the state of affairs which has come to exist at Washington in our time, and is still tolerated and even encouraged there, of picking out a high officer of state so as to make a place for some other politician somewhere else. To an English public man such a step would be not only unintelligible, but horrible. No doubt, it is stupid for him not to inform himself more thoroughly as to all the possibilities of public life in this country, but to this extent he must be allowed a little latitude, for it hardly lies in our mouth to complain very loudly of his error in taking it for granted that our Secretary of State was mentally sound.

Now that the condition of affairs in the State Department is understood in England, what are we to say of the effect that it will have on the relations of the two countries? Nobody can be sure that it will have any, it being taken for granted that it will not be allowed to last; but the extraordinary character of the trouble over the "shirt-sleeves" dispatch may serve to remind us that the actual conduct of the business of diplomacy between two countries like America and England is of vastly more importance than the condition of sentiment and feeling on either side. What prevented war between the United States and England in 1861? It was not indifference, or amiability, or popular hatred of fighting, but the character of the representatives of the two countries, and especially of the United States—Lincoln, Adams, and Seward—and the fact that they had been picked out on both sides as the very best men to do their work who could be found.

A NEW PROFESSION.

There is a marked contrast between the methods employed by men in making investments in real property and mortgages and those which they follow in investing in other securities. In the city of New York, and the cities generally, whoever buys a piece of land or takes a mortgage has his title examined by a trained and responsible expert, to whom he—or the maker of the mortgage—pays a substantial fee. To omit this precaution, except under peculiar circumstances, is regarded as decidedly unwise and unsafe. Fiduciary institutions invariably require it, and so do all trustees. These conditions have therefore resulted in the existence of a regular body of trained conveyancers, whose special business has become a recognized profession.

If we inquire into the practice of men who invest in corporate bonds, we find an entirely different condition of affairs. Conveyancers themselves, who will not let a client make a loan on bond and mortgage without the most thorough investigation, will buy a railroad bond in complete ignorance of the real condition of the property securing the loan. They may, it is true, ask the opinion of their bankers or brokers, but this opinion is seldom based on any truly scientific induction, and is never, we might almost say, comparable with that of a conveyancer upon title. The bankers and brokers hear the current gossip; they know many significant things about railroad directors and managers; they may happen to know about the borrowings for current expenses of particular roads. But unless they have special sources of information, they can give their customers only the current opinion of the financial world. This may be generally correct, but it is liable to be mistaken, and the consequences may be disastrous in the extreme. Every one has bought because every one else bought, and when the security on which they relied comes to be tested it is found to be insufficient.

Nor should it be forgotten that bankers are under constant temptation to take optimistic views. They are offered large commissions to "float" bonds, and it is only natural that even honest bankers should behold the future through rose-colored glasses. They are not, as a class, trained to the scientific determination of all the causes that may operate in favor of or against a railway. They are, of course, as a rule, able men; many of them men of the greatest sagacity. But they are not qualified nor do they undertake to act as advisers. They do not make it their profession to give opinions on any cases that may be submitted to them. They will give their friends and customers the benefit of their information and judgment; but they do not offer information and judgment for sale, as a lawyer or a doctor offers his opinions.

Mr. T. L. Greene's recent book, 'Corporation Finance,' shows the necessity of establishing a new profession. There ought to be men as well qualified to certify to the merits of railroad bonds as the men who now certify to the merits of land-titles. They should make it their business to analyze and verify the official reports of corporations, and to check these reports by collateral investigations and comparisons. There are now, it is true, quite a number of professional auditors, but they are generally called on only in case of extensive reorganizations, when the overhauling has to be complete, although they have been

sometimes employed to recommend certain securities to investors. But what is required is a class of responsible experts, available for the service of the ordinary investor who has a few thousand dollars at a time to put into something. Such investors, whether men or women, and the trustees of churches, colleges, hospitals, and many other institutions, are often much worried by the investments that they have to make, as well as by those that they have made. Were they able to secure expert advice at a moderate expense, they would find it a great convenience, and in the end a great saving. The losses of the last few years have been so severe as to make people conservative, and if it were found practicable to obtain really trustworthy advice concerning the merits of investments, very few investors would dispense with it.

The beginnings of the new profession are already visible. The number of men who are now competent to pass on the validity of municipal bonds is considerable, and the forms of corporation mortgages and stock certificates are subjected to critical examination by bankers' counsel. But, as Mr. Greene shows, the coming bond conveyancer will have to do more than this. He must be able to take the published reports of corporations, and by comparison and analysis drag the truth out of them. He may not be able to detect absolute falsification. If a railroad reports that it has bought a thousand freight-cars when it has really bought only five hundred, it may for a time deceive those who do not physically inspect it. But such frauds as this are seldom attempted, because they cannot be carried on without admitting too many people into knowledge of the deceit. And there are many ways in which such a fraud must soon disclose itself to the trained eye. There are the reports of former years, and the reports of similar corporations, comparisons of which show with relentless accuracy the true conditions of corporate enterprises. To analyze these reports and draw from them correct inferences requires ability of a high order, but we do not suffer from lack of ability. Ability suffers rather from lack of opportunity, and in the field described by Mr. Greene there appears to be ample opportunity. The public can well afford to pay those who are able to save it from throwing away its money in dishonest and badly managed enterprises.

THE POURBOIRE IN DANGER.

The inroads of the "tipping" habit upon our severe republican simplicity have often been commented upon. Its conquests have been deplored by jealous patriots who would not willingly see the servility (or the serviceableness) of the lower classes in Europe imported into this fair land. But their efforts to stay its triumphant march have been, it must be confessed, but so much labor lost. Tip-givers admit all their arguments, but go on tipping. Nor have the appeals to the manhood and independence of servants and waiters seemed to make their palms any the less ready to secrete the grateful coin. Indeed, the takers of tips might well say that there is a delightful confusion of ideas in the way they have been rebuked by social reformers like Mr. Howells. Which is the more demoralizing, to pocket a fee, or to pocket superior advice? To be bidden to assert yourself against the man who would break down your independence by a gift, but to be expected to submit in a craven spirit to the directions how to conduct your life by a man who descends upon you from the upper spheres, is not a little puzzling. At any rate, tippers and tippees have gone on increasing in the United States in an astonishing way, within the memory of any man of middle age.

But while this foreign custom is thus subduing us, it is, strangely enough, suffering a powerful attack, in an unexpected way, right in its immemorial home. To say that there is a possibility of no more pourboires in France sounds almost like saying that there will be no more travelling in France, no more dining, no more living in hotels, no more concierges, no more garçons. Yet a strong movement in favor of abolishing the pourboire, at least in cafés and restaurants, is now on foot in Paris. The comic illustrators picture the astonished guest actually going on his knees to the waiter to try to get him to take the customary pourboire, while that majestic being pushes it away as sternly as Cæsar did the crown. That is the astonishing part of the whole affair —the protest against the pourboire is made by those who have been in the habit of receiving it.

Let no one think that this is due to a belated spreading in Paris of American ideas of manhood and the dignity of labor. This would be doing the French waiters too much credit. No, their revolt against the pourboire springs from much more elementary human instincts, the desire to live, for instance. The case is this. The pourboire has given a chance to keepers of cafés to oppress their employees. By maintaining a pretty close watch, they have arrived at a fair notion of how much a waiter receives on the average in the form of pourboires. This has gradually suggested the practice not only of paying no wages at all to garçons in frequented restaurants, but of compelling them actually to buy their positions. Nay, in addition they are forced to turn over to their employers all that they receive above a certain sum, which, of course, is a sum all the while tending to the minimum. In the keen competition of French society, men are found willing to do waiters' work for a bare subsistence, and they set the standard to which the others, under the system mentioned, are forced more and more to conform. The more they get in pourboires, the more they have to give up. French lucidity at last saw that the only hope was in the abolition of the pourboire and the return to a system of fixed wages, and accordingly the waiters, to the infinite amusement of the wits and the boulevardiers, are now quietly requesting their customers to omit the pourboire altogether.

Economically, the situation is a new illustration of Ricardo's doctrine of rent. Rent of land is, scientifically, the difference between the productiveness of good land and of that which yields a bare subsistence. In this point of view, the waiter is simply the tenant of the restaurant-keeper. If he takes in pourboires to the amount of 10 francs a day, while another gets only 3, and can manage to live on that sum, the first has to pay over 7 francs, which is clearly Ricardian rent. The garçon is no longer a hired servant, but simply a *métayer*. His position and tools are furnished him, but the inexorable doctrine of rent reduces his returns to the bare sum required to support life. It is this "iron law" so visibly at work, and not any fanciful notions about personal independence, which has led the French waiter to rise against the tyranny of the pourboire.

Another urgent motive for doing so would be furnished him in the concern just now manifested in France over the undoubted growth of alcoholism. This has caught the attention of many medical men, and for it they have assigned many causes. A Dr. Legrain, in charge of an asylum for inebriates at Ville-Evrard, has ingeniously argued that one unmistakable cause is the pourboire. He is not punning; he is sober, if his patients are not. They number, he says, some 250, and of them a very undue proportion he finds to consist of *garçons de café*, coachmen, porters, valets, and servants—the class, in short, most in the habit of receiving pourboires. Evidently this kind of tip is taken in France with great literalness; and waiters might well pause to consider, in the light of Dr. Legrain's statistics, how in the end it biteth like an adder. But we fear that their agitation is not reinforced by such moral considerations.

The whole thing is suggestive, however, of the way in which the evil—if we grant that it is an evil—can alone be successfully attacked. Something extra for the performance of simple duty will be given as long as those who give think they will be better served in consequence; or simply out of compliance with imperious custom; or perhaps on the conviction that wages are kept low because they are expected to be supplemented by tips. Pourboires will be taken, too, in spite of all the moral

and social reasoning that can be brought against them. But let them work into such unpleasant results as the Paris waiters are now experiencing, and the case is at once altered. Selfish human nature does sometimes quietly effect a social reform beyond the achievement of unselfish reformers.

INEDITED LETTERS OF NAPOLEON I.—II.

PARIS, August 12, 1897.

I have tried to give an idea of the tone of Napoleon's correspondence with his brothers; he assumed at all times towards them the character of a master, and the clannish feelings of the Bonapartes made it seem almost natural that he should do so. He owed much to Lucien, but his other brothers owed everything to him.

From the tone of his family correspondence it is easy to imagine how he spoke to his ministers. There are, in the two volumes published by M. Léon Lecestre, many letters addressed to Fouché, the Oratorian, whom Napoleon made Duke of Otranto, and who was for a long time his Prefect of Police, afterwards becoming one of the instruments in the restoration of the Bourbons. In the first letter addressed to him (on the 23d Frimaire, An IX.), he is still called Citizen Fouché. On the 21st of September, 1804, Napoleon was at Mayence, preoccupied with the movements of some royalists. He speaks at length in a letter to Fouché of Rivière, an agent of the Count d'Artois, afterwards Duke de Rivière:

"I think it would not be difficult to make Rivière speak. A clever agent, who should begin by entering into the confidence of a woman who has been his mistress, and who has taken a great interest in him, might be bearer of a letter from the Count d'Artois, which would fulfil its object; and you need not be embarrassed by signature or seal. You could find a way to have this man speak to Rivière in his prison, and the most extravagant would be the best. One might suppose, for instance, that this man had enlisted in the corps which guards the prison. Have the first interview a day when he is on guard in his uniform; add 200 louis, which this individual would be commissioned to place in his hands, and give him to understand that there are ways of procuring for him as much as 2,000 louis. Rivière will probably first send money to his sister; you will see that she receives it. At the end of a fortnight, you will have, by this means, a correspondence between the Count d'Artois and Rivière, which should be very curious. In order to succeed, you must keep Rivière in prison, and not let him see his mistress."

In another letter, from Trèves (October 8, 1804), he tells Fouché to send "an agent to Vilna, who will follow the Count de Lille [Louis XVIII.], learn what he is doing there, and what relations he has with the governors and commanders of that country."

From Milan (May 22, 1805) he sends instructions as to the press:

"The *Gazette de France* is the paper which seems to me the best-written and in the best spirit. . . . It recalls no bad memory of the Revolution. . . . I have already announced to you my intention of naming a censor for the *Journal des Débats*. This paper seems to be going from bad to worse. . . . It would be a good thing to wrest it from the hand of Bertin, an agent of intrigue and of treason. If the thing cannot be done gently, prepare for it, nevertheless; for, at the first bad article in the *Débats*, I shall suppress it. . . . Let some article be written against the Princess D. . . ., who talks ridiculously and indecently at Rome. You know that she has lived long with a singer; that her diamonds, of which she talks so much, came from Potemkin, and are the price of her dishonor. . . . She wishes to be considered a *femme d'esprit*, she is acquainted with the Queen of Naples, and, what is quite as astonishing, with Madame de Staël."

From the Camp of Boulogne he writes on August 22, 1805, to Fouché:

"I hear that Gen. Lecourbe has returned to a country house which he has near Paris. I had sent orders to him to go to Franche-Comté. If he is still at his country house, have him arrested and taken to Franche-Comté by the gendarmes. . . . Let him know that the first time he comes within forty leagues of Paris I will have him arrested and transported. . . . I know the part he had in the conspiracy of Cadoudal. . . . He is a bad, dangerous man, who is on good terms with all my enemies."

The same day he says: "I don't know why you did not arrest the Baron de Viomesnil when he came to Bordeaux. You ought to have him imprisoned at once. You show a weakness in your administration which I cannot imagine." Orders are sent to exile to Dauphiné the ladies La Rochejacquelin, Zibot, and others, "who have given refuge to priests who refused to take the new oath." It would be too long and too tedious to mention all such orders of arrest. The general impression that remains is, that Napoleon was always urging Fouché to be more severe; his tone is always peremptory. Thus: "If M. Chénier [brother of Alfred Chénier and a dramatic poet] allows himself the slightest chatter, let him know that I will order him sent to the Island of Sainte-Marguerite. The time for pleasantry is past. Let him keep quiet; it is the only right he has. . . . Don't let that *coquine de* Madame de Staël approach Paris." Napoleon is never tired of abusing Madame de Staël.

"Among the thousand things," he writes from Finkenstein (April 19, 1807), "you will see by this letter what sort of a good Frenchwoman we have in her. She would do anything to see Prince Louis, our mortal enemy and the cause of the downfall of his monarchy. It is my intention that she shall never leave Geneva. Let her go, if she likes, with the friends of Prince Louis. To-day courting the great, to-morrow patriotic, democratic, one cannot repress one's indignation when he sees all the forms taken by this . . . and ugly besides. I don't tell you of all the projects formed by this ridiculous set, on the chance of my being killed; a minister of police ought to know all that. All I hear of this miserable woman shows me that I must leave her in her Coppet, with her Genevese and her Necker family."

In 1807 he writes from Rambouillet (September 7):

"You will issue an order of arrest against Kuhn, American Consul in Genoa, for wearing a cross of Malta given by the English and as agent of England. . . . This man, having received a foreign decoration, has ceased to be an American. I am vexed that you should have entered into communication with the United States Minister. My police know no ambassadors. I am master at home. If I suspect a man, I have him arrested. I would arrest the Ambassador of Austria if he entered into a conspiracy against the state."

It is very interesting to see with what care Napoleon examines the receipts and expenses of his Minister of Police; he will know all that is produced by the gaming-tables (they were allowed in Paris and the principal towns of France till 1830), by passports, by licenses for shooting, etc.; he examines all the documents of what the French call *comptabilité*.

"The budget," he says, "is my law; you must conform to it, as the finances, in all branches of the administration, are my first business. . . . The Minister of War does not give 50 francs to an officer without my signature. You must not have people receive 300,000 francs and think that they receive it from another than myself. It is opposed to good service and to the internal administration of the state. Lay before me this month the budget of 1808. Add some observations to each chapter, for I will have a serious budget. Retrench all useless expenses." (Fontainebleau, October 18, 1807.)

Napoleon was unwearied in scolding Fouché: "You do not exercise the police with the necessary activity and energy." He was constantly finding fault also with the papers, the *Journal des Débats* particularly, and made Fouché responsible for their stupidity. He insisted upon having every day a bulletin from the police. "I don't know why I no longer receive every day a police bulletin. See that I have it daily." (Bayonne, June 11, 1808.)

His ideas on the old families are well shown in the following letter:

"I learn that some families of *émigrés* avoid the conscription for their children, and keep them in culpable idleness. It is clear that the old and wealthy families which are not in my system are against it. I want you to have a list made of ten of these important families by department, and of fifty for Paris, letting me know the age, the fortune, the quality of each member. My intention is to issue a decree sending to the military school of Saint-Cyr all the young men belonging to these families between the ages of sixteen and eighteen. If any objection is made, your only answer will be that it is my *bon plaisir*. The coming generation must not suffer by the hatreds and small passions of the present generation."

The army seemed to him the crucible in which all the elements of French society were to be melted together; but it is certainly curious to see him adopt in his arbitrary measures the very words used under the old régime, "Car tel est notre bon plaisir."

Napoleon's discontent with Fouché becomes more and more visible as we advance in the correspondence: "You are not making the police of Paris. . . . Occupy yourself with the police, not with affairs which do not concern your ministry." "I invite you to leave politics aside and to let me know frequently what is going on in the departments. What I have just told you I ought to have learned from you. I attach importance to such facts, not to vagaries on Russia and Prussia." We come now to the climax. On July 1, 1810, Napoleon sent from Saint-Cloud to Fouché a note thus conceived: "Monsieur le Duc d'Otrante: Your services can no longer satisfy me. It is proper that you should be off in twenty-four hours, to remain in your *sénatorerie*. This letter having no other object, I pray God that he have you in his holy keeping." Among the reasons for Fouché's dismissal was his interference with the affairs of Lucien Bonaparte, as well as his relations with the great army contractor Ouvrard. Napoleon suspected Ouvrard of having communication with England and had him arrested. He accused Fouché of being more his brother's minister than his own. At the first moment when he appointed Fouché Governor of Rome, he said to his brother, the King of Westphalia, and to his Arch-Chancellor, "I will never replace that man; he has his defects, but he

is the only statesman I have had." The decree was cancelled, however, when Napoleon claimed from Fouché all the letters which he had written to him during his ministry. Fouché answered that he had destroyed them; his papers were searched, but nothing of importance was found.

I have given extracts from this correspondence, indicative of the character of the two volumes published by M. Lecestre. These volumes are a mine which is not easily exhausted. Fouché reappears in them during the Hundred Days, as Minister of the General Police. The tone of the notes sent to him by the Emperor is quite different; they are short, cold, and polite. Napoleon had need then of Fouché, and did not feel as strong himself as in old times.

From a psychological point of view, it would be interesting to follow, in its developments, the correspondence of Napoleon with Talleyrand, the man who played in the diplomacy as important a part as Fouché in the police of the Empire. Napoleon said at St. Helena that they had as much to do with his downfall as his enemies; he called them traitors. True, he had covered them with honors, but he had always made them pay dearly for these, and had never concealed his contempt for them.

THE SCHOOLS OF ARCHÆOLOGY AT ATHENS.—IV.

THE BRITISH SCHOOL OF ARCHÆOLOGY AND CLASSICAL STUDIES.*

In spite of the evidence to the contrary which the existence of the great British Museum justly may be supposed to offer, it is nevertheless true that the modern science of archæology has been long in securing a foothold in Great Britain. During the last century and the greater part of this, the scholars of Great Britain have busied themselves with the discussion of the text of the Greek classics, the study of Greek grammar, and other cognate branches; but archæology, the great verifier and vivifier of the written word, was uncultivated except by a few, whose names are still held in honor. In Great Britain, the traditional methods of an old-fashioned scholarship have been tenacious of life, and to this day the flavor and fragrance of the olden time still clings to British soil and influences British thought. I remember the astonishment and incredulity with which, only eleven years ago, an English professor of Greek, who has gained renown by his admirable translations of Xenophon, received from me the startling news that in America all boys were taught to read Greek with the accents. I well remember, too, my own amazement at the discovery, some fourteen years ago, that the holder of the Oxford travelling studentship to Asia Minor was actually afraid to give to his articles titles that would at once indicate the archæological trend of his work, lest such departure from the classical traditions of Britain might give offence in academic circles at home. To be sure, such archæologists as Sir Charles Newton and a few others had long been working in honored isolation in England, and plans for a British School at Athens had been discussed for several years, but still it is, perhaps, not incorrect to say that the founding of the American School of Classical Studies at Athens marked an era in archæological endeavor in Great Britain as well as in America. Certainly it aroused a feeling of generous rivalry in the breasts of the friends of archæology in the dear old islands, which, with their classical traditions, learned leisure, and great wealth, might certainly hope to emulate the example of the transatlantic nation of yesterday, if not that of France and Germany, countries in which archæology had been cultivated as a science for more than fifty years. Indeed, when Mr. Goodwin was returning from Athens, after having piloted our School through the first year of its existence, matters had already progressed so far that he could be present at a meeting held in Marlborough House, on June 25, 1883, under the presidency of the Prince of Wales, to consider the question of the establishment at Athens of a British School of Archæology and Classical Studies.

About thirty of the leading scholars and statesmen of England took part in that meeting, at which a resolution was passed avouching the expediency of establishing such a school. At the same time the scholars composing the meeting defined the object of the School, the duties of the Director, the conditions of membership in it, and moved a subscription for the general purpose. The sum of $20,000 was subscribed, and the executive committee decided to expend $15,000 of it in erecting a suitable building upon the large plot of ground that had just been offered by the Greek Government to the promoters of the enterprise. The remaining $5,000 was reserved for the purpose of providing a library of reference. This plot of land, something less than two acres in extent, lay on the southeastern slope of Mount Lycabettus, and adjoined the plot of similar size which the next year was given to our School. The land was conveyed to the trustees of the British School on November 3, 1884, and work was begun at once. The plans of the building were drawn by Mr. F. C. Penrose, the distinguished architect, who became the first director of the School, and the School was actually founded with no director, no students, and no money wherewith to pay the salary of the director. As has been pointed out in the paper on the American School, this courageous action of the British stimulated interest in America, and, thanks to it, a proud building, floating the American flag, has long stood by the side of the English institution.

The aim of our School is not so much splendid achievements with the mattock and the spade as it is to educate a body of young Americans who may be able to pass on to others the influence of their sojourn in Greece. On the contrary, one of the main objects of the British School is the excavation of ancient sites, or, to use the language of the rules and regulations:

"The first aim of the School shall be to promote the study of Greek archæology in all its departments. Among these shall be (i) the study of Greek art and architecture in their remains of every period; (ii) the study of inscriptions; (iii) the exploration of ancient sites; (iv) the tracing of ancient roads and routes of traffic. Besides being a School of Archæology, it shall be also, in the most comprehensive sense, a School of Classical Studies. Every period of the Greek language and literature, from the earliest age to the present day, shall be considered as coming within the province of the School."

The British School was opened in November, 1886, by Mr. Penrose, who years before had made himself famous by his examinations of the Parthenon, and but recently had conducted excavations on the site of the Olympieion. The British School is therefore the junior of the American School by four years. In 1887 Mr. Penrose was succeeded in the directorship by Mr. E. A. Gardner, the first student who ever attended the School. Mr. Gardner guided the fortunes of the School for eight years, and with success, in spite of the ever-present lack of money, for during the first nine years of the existence of the School its normal income had been only $2,500, of which annual sum $500 was contributed by the University of Oxford, $500 by the Hellenic Society, and $500 by Mr. Walter Leaf, renowned the world over for his brilliant studies in Homer. The remaining $1,000 was made up by about eighty persons, who subscribed annual sums ranging from $5 to $50. This was disheartening, for the School owed its precarious support chiefly to the liberality of a few lofty-minded men, and as yet the *national* sentiment of Britain had not been aroused. And yet the School had conducted important excavations in several places—in Cyprus, which yielded inscriptions and works of art of various styles and periods; at Megalopolis, which yielded results of unique interest, especially as shedding light upon the theatre-question; at Alexandria, in Egypt, where the results were important, though negative, inasmuch as excavations at Alexandria were proved to be impracticable because of the depth of the soil and the bad condition of what is preserved beneath it. Besides these excavations, valuable contributions had been made to ancient topography in Cyprus, Aetolia, and Arcadia; light had been thrown upon many problems in the development of ancient art by the cleaning and sorting of the bronzes found during the course of the excavations on the Acropolis, and the remains of Byzantine art that were scattered throughout the length and breadth of Greece had been studied and illustrated.

But the close of Mr. Gardner's successful conduct of the School in the face of serious discouragements marked a turning-point in its history, for in June, 1895, a memorial was presented simultaneously to the First Lord of the Treasury and to the Chancellor of the Exchequer, praying that an annual grant of $2,500 be made to the School from the public funds. This memorial was signed by almost all the scholars and dignitaries of the United Kingdom; perhaps so many honored names were never before attached to so simple a petition. The Government was favorably impressed by the memorial, and one of the last acts of Lord Rosebery and Sir William Harcourt, before their resignation, was to record a Treasury minute recommending that the grant be made from the fund set apart for scientific investigations. The present Lords of the Treasury confirmed the minute of the outgoing Ministry, making the grant for five years beginning with 1897, and there is every reason to hope that at the end of the five years the grant will be renewed, in the case of efficient work during that period.

On July 9, 1895, a meeting in the interest of the School was held in St. James's Palace, under the presidency of the Prince of Wales. Speeches in enthusiastic support of the School were made by the Prince of

*Most of the facts contained in this paper have been gleaned from the 'Annual of the British School at Athens,' No. 1, Session of 1894-5.

Wales, Mr. Leaf, Mr. Macmillan, the Duke of Sparta, the Archbishop of Canterbury, Prof. Jebb, Sir Frederick Leighton, Mr. Egerton (H. B. M. Minister at Athens), Lord Herschell, and Dr. Magrath, Vice-Chancellor of the University of Oxford. At this meeting it was resolved "that the British School at Athens has already done excellent work during the nine years of its existence, and is well deserving of increased support," and, secondly, "that this meeting pledges itself to use every effort to place the School upon a sound financial basis, so that in point of dignity and efficiency it may worthily represent this country among the other foreign institutes in Athens." As a result of this meeting, annual subscriptions to the amount of $1,875 were promised, mostly for periods of five years, and donations were received to the amount of $7,300. By reason of all these agencies the present income of the School is about $6,000 a year, of which a considerable part was secured for five years, beginning with 1895. The value of the Treasury grant must not be measured by its amount, but by what it implied: that the work of the School was important enough to the national life of Great Britain to justify encouragement by the State. Furthermore, it must be a source of gratification to every one to know that this verdict in regard to the value of the work of the School has been passed by both political parties, so that the future existence of the School seems to be assured, though, of course, substantial aid will be needed continually in order to maintain it in a permanent state of efficiency.

In 1895, Mr. Cecil H. Smith, assistant in the British Museum in the department of classical antiquities, was elected director for the period of two years, the British Museum being unwilling to lend him for a longer time. The period of his incumbency has just expired, and he is to be succeeded by Mr. D. G. Hogarth, who has distinguished himself by archæological work in Cyprus, Asia Minor, and Egypt. In the last country he was associated with Flinders Petrie, and conducted the excavations at Alexandria, with the assistance of two members of the British School, Messrs. Benson and Bevan. During his directorship Mr. Smith conducted excavations in the island of Melos and at Athens, where he sought for the site of the Cynosarges, and, as is claimed, with success. Last fall he was fortunate enough to discover a remarkable replica of the Parthenos at Patras. During his incumbency the borders of the British School have been enlarged materially by the erection of an additional building upon the grounds of the School. The new building is intended to be a kind of club-house, in which the students may room and board. Such a club-house is much needed by our School, also, for both Schools are situated so far from the centre of the city and the decent restaurants that a vast deal of precious time is lost by the students simply in travelling back and forth from the School for their meals. The result is that those students who room down town, at a distance of a mile or more from the School, are averse to making more than one trip a day to the School library, especially in warm weather, when the climb of a mile up hill in the hottest part of the day is peculiarly distressing, as well as disastrous to efficient work. This is much to be deplored, for the students would be immeasurably the gainers if all of them could be accommodated in a School building where they could have their private apartments and get wholesome meals besides. They could then work in the library both by day and by night, so that the efficiency and the amount of work done by them would be increased almost by half.

In 1895, after nine years of the British School's existence, its *first* 'Annual' was issued. It contains the report of the managing committee, the proceedings of meetings held in support of the School, and certain supplementary matter consisting of papers read at the meetings of the School, or otherwise illustrating its work. Up to date no second volume has appeared, although in the prefatory note to the first volume its continuance as a *periodical* was promised. This Annual is not to be in any way a rival of the *Journal of Hellenic Studies*, seeing that the more elaborate papers by members of the School will continue to be published in the *Journal*, whereas the Annual is to be the repository for more popular accounts of travel or research, so that the two periodicals will supplement one another.

The number of students who have attended the British School is about forty-five, though I have no means at hand of ascertaining the exact number. Upon their return to England all have obtained desirable and influential positions, and it can be predicted with safety that they will be indefatigable workers in the interest of the School, that it may take rank along with its sister schools of archæology.

Besides the four Schools that have been discussed in the preceding papers, there are other archæological agencies of first-class importance at work at Athens. As a preliminary to the founding of a School of Archæology, Austria for several years has had in successful operation an Archæological Mission under the charge of Drs. Reichel and Wilhelm, Privatdocenten in the University of Vienna. They are the peers of any archæologists in Athens, and their lectures are downright features of the archæological year. Wilhelm's lectures on the science of epigraphy in the presence of the original stones in the Epigraphical Museum are attended by the members of the American School almost in a body.

Another archæological agency of like importance is the Greek Archæological Society, whose work of excavation during the past year has been made known to your readers. Gerhard visited Greece in 1837, just eight years after the founding of the Institute of Archæological Correspondence in Rome. Full of enthusiasm for archæology, and inspired by the belief that an institution in Greece somewhat similar to the one in Rome would do wonders in the way of preserving the precious remains of the past that still existed on Greek soil, he suggested to the native and foreign scholars of Greece the necessity of creating a society for the purpose. The Greek Archæological Society, the result of Gerhard's timely suggestion, has done distinguished work during all these years, both by its epoch-making excavations and by preserving the finds in museums and otherwise. Though the Archæological Society is not a school of archæology, yet its members are most important factors in the archæological life of Athens, for they read papers upon archæological subjects both before the German and French Schools, and especially before the Parnassos Society. Indeed, some of the papers by Greek scholars were among the most important read at Athens last winter. As the result of all these agencies, the American student at Athens is actually in danger of surfeit because of the superabundant feast that is spread before him. He is a welcome guest at the exercises of all the Schools, of the Austrian Mission, and of the Parnassos Society, so that, if he can understand French, German, and Greek, he must of necessity make rapid strides in the acquisition of a knowledge of archæology. Indeed, for the budding professor of Greek, residence at Athens for a year or more is not merely a necessity, but a most precious privilege which no man can afford to deny himself.

Unfortunately our School at Athens is too little known throughout the country at large, especially among the students of our universities and colleges. There are but few candidates for the two fellowships offered by the School, though this may be due to a consciousness of inability to stand the examinations for a fellowship. The fellowships pay $600 a year, and are open to any American. They cannot be had for the asking, however, but only by passing successfully a series of examinations upon Modern Greek, the Elements of Greek Epigraphy, the Introduction to Greek Archæology, the Principles of Greek Architecture, the History of Greek Sculpture, the Introduction to the Study of Greek Vases, Pausanias, and the Monuments and Topography of Ancient Athens. The examinations cover a large field, it is true, but they require only such knowledge as is necessary for the full enjoyment of the privileges of a residence at the American School. It must be noted that these examinations are intended solely for those who aspire to the honor of a fellowship in the school—that is, to the honor of being leaders in the School. Simple *membership* in the School is accorded to the graduates of the subscribing colleges as their right, but it must not be forgotten that graduates of all reputable colleges in America may become members simply by application to Prof. John Williams White, Cambridge, Mass., or to Prof. Thomas Day Seymour, New Haven, Conn., who will gain for them the approval of the Committee. Such approval is cordially given, because the object of the School is to inspire as many souls as possible. The same gentlemen will furnish applicants with copies of the Annual Report, which contains all information necessary to the prospective student.

The examinations for the fellowships are held on the same day in May at any or all of the contributing colleges, and, for the convenience of Americans studying abroad, in Berlin and Athens. The successful candidates may compete for the prize as often as they wish, and the chances are that they can easily win it a second or a third time.

J. R. S. Sterrett.

Correspondence.

THE PATRIOTIC VIRUS.

To the Editor of The Nation:

Sir: In commenting on a story of Mr. Owen Wister's in the August number of *Harper's*, you remark that you "cannot help suspecting that he is a victim to the pseudo-patriotic virus which is doing so much to poison letters."

Cannot a virus very like that which you

suspect in Mr. Wister's tales be found far earlier in American literature — in the 'Sketch-Book,' for example, in 'English Traits,' and, especially, in the second series of the 'Biglow Papers'? It is true that the *Nation* was not in existence when Irving and Emerson and Lowell fell victims to this bubonic plague of "pseudo-patriotism," as you call it; but have you not been derelict to your duty in failing to denounce similar symptoms visible in the later writings of Col. Higginson, of Mr. Warner, and of Mr. Howells? And is it too late now to do anything to put down the plague and save American literature? Perhaps the *Nation* could issue a call for a meeting to form a society to combat the evil—an active organization on the model of the Anti-Vaccination League. BRANDER MATTHEWS.

THE CATSKILLS, August 16, 1897.

[We are more fearful that we have been derelict in Prof. Matthews's own case, though he modestly forbears to press it. If so, he has our apologies.—ED. NATION.]

NO MEDIUM FOR SERIOUS ARTICLES.

TO THE EDITOR OF THE NATION:

SIR: In your number of July 29 your correspondent "Prexie" notices the dearth of articles of special literary scholarship in the periodicals of to-day; and in the reply of "Professor," August 12, the truth of this is implied. Neither of these correspondents remarks how difficult it is to find admission for such papers to-day, when the American magazines, even those whose literary quality has been best maintained, are distinctly deprecating any articles which do not relate to subjects of general current interest. Except in these periodicals, the results of special research can hardly be published, as your correspondent desires, "in forms widely intelligible to thoughtful educated men and women"; for book-making requires much time and an accumulation of material, and, what is still more serious to the needy scholar, it ordinarily brings small and tardy remuneration.

Perhaps when the reading public is satiated with the profuse illustrations and short stories which now pervade our magazines, there may again be room and encouragement for less volatile writing. Until then it is scarcely fair to infer from the dearth of them that discussions at once serious and interesting upon scholarly subjects are among the lost arts. E. L.

AUGUST 17, 1897.

Notes.

Messrs. Putnam have just brought out the fourth volume of the important 'Life and Correspondence of Rufus King,' covering the period 1804-1806. We shall report upon it in due course. The editor, Dr. Charles R. King, announces to subscribers that his material surpasses his calculations, and will overrun the five volumes contemplated in the contract. Nevertheless, he will supply the sixth volume without additional charge to all who subscribed before July 1, 1897, while all future subscribers must pay thirty dollars instead of twenty-five for the complete work.

The same firm give notice that they will include in their precious series of "Writings of the Fathers of the Republic" the works of Samuel Adams, now collected for the first time, and to be edited by Dr. Harry Alonzo Cushing of the Department of History of Columbia University. The Messrs. Putnam would be glad to correspond with the possessors of material pertinent to this enterprise.

Frederick A. Stokes Co. have under way Lord Lytton's 'Lucile,' illustrated after water-colors by Madeleine Lemaire; 'The Love Affairs of Some Famous Men,' by the Rev. E. J. Hardy; 'The Son of the Tsar,' an historical novel, by James Graham; 'Lying Prophets,' by Eden Phillpotts; and a collection of Fairy Tales by Thomas Dunn English, illustrated by Miss Elizabeth S. Tucker.

Facsimiles of autograph letters by Tennyson, Browning, Lowell, Holmes, Dean Stanley, and other celebrities will adorn Dean Farrar's 'Men I Have Known,' to be published in October by T. Y. Crowell & Co., who have also in hand an English translation of an historical novel, 'The Pharaoh,' from the Polish of Bolislaw Prus (Alexander Glowacki).

L. C. Page & Co., Boston, publish immediately 'The Court of Nideck,' adapted from the French of Erckmann-Chatrian by Ralph Browning Fiske, and illustrated by Victor A. Searles.

Small, Maynard & Co., Boston, have acquired the sole right to issue the writings of Walt Whitman, and will bring out greatly improved editions of the 'Leaves of Grass' and of the 'Complete Prose Works' early in the autumn—the latter with illustrations.

'From September to June with Nature'—that is, with Nature during the primary school year—by Miss M. L. Warren, is in the press of D. C. Heath & Co. It will be illustrated.

'A Batch of Golfing Papers,' by Andrew Lang, is announced by M. F. Mansfield, No. 22 East Sixteenth Street.

Mrs. Elizabeth Wormeley Latimer has in preparation for A. C. McClurg & Co., Chicago, 'Spain in the Nineteenth Century.'

In the momentary pause in book production, we may glance at the reprints which have been accumulating on our shelves. The two 'Jungle Books' of Rudyard Kipling carry on the Scribners' beautiful uniform edition of this author's works, and combine a weird and stirring text with excellent specimens of the elder Kipling's designs in relief. From Macmillan we have, in their series of standard novels of the first half of the present century, Marryat's 'Snarleyyow,' with a good introduction by David Hannay, who extenuates the profuse brutality of incident on the ground of the unreality of the characters. He might have added that the childish mind is guarded from the effects of this brutality by the dominating humor of the story. The same firm sends us, in connection with J. M. Dent & Co., London, two more volumes of the translation of Balzac edited by George Saintsbury, viz., 'Lost Illusions' and 'A Distinguished Provincial at Paris,' both Englished by Ellen Marriage. The style of this edition is very elegant, and so on an humbler scale is that of Dent's "School for Scandal" (in the pocket "Temple Dramatists") and Boswell's Johnson, to fill six of the small numbers of the "Temple Classics" over which Mr. Israel Gollancz presides. This fresh symptom of the Johnsonian revival for which Dr. Birkbeck Hill has done so much, is based on the sixth edition of Boswell, and is annotated by Mr. Arnold Glover.

The Harpers' new edition of their 'Georgia Scenes' bears the copyright date of 1840, and though the ante-bellum Southern literary humor is rather painful reading, the truthfulness of these sketches gives them an historical value that justifies their revival. Much of what is depicted is coarse, not a little is cruel, but the authors are not blind to this. The hunting and racing, shooting and "gander-pulling" scenes were but a part of the neighborhood sports of a rural community. The running down of a negro was a common diversion, and the lynching so prevalent to-day is partly maintained by the gratification it affords of the love of excitement in a crowd. There is nothing of this complexion in these pages, but the chapter with the unpromising heading, "A Mother and her Child," throws a noticeable side-light on the manners of domestic slavery.

The world was much slower in accepting Richard Wagner as a poet than as a musician. Indeed, the principal cause of prolonged misunderstandings was that the critics, in spite of his essays and protests, persisted in treating him simply as a composer, usually sneering at his poems, which were caviare to them because so different from all previous opera texts. But of late a change has ensued, and Wagner's poetry is now receiving almost as much attention as his scores. Within the last few years several writers have attempted to show that his opera-poems are capable of being put into the form of prose tales, like those based on Shakspere's plays. The latest of these is entitled 'The Story of the Rhinegold' (Harpers), and was written by Miss Anna Alice Chapin, a girl of only seventeen years, though no one would suspect her youth from her style or the quality of her work. Indeed, her book is the best of its kind yet issued. It shows no trace of being based on operatic texts, and reads as naturally as a fairy story invented as such. It is intended for young readers, and Miss Chapin has succeeded, partly in the text, partly in an introductory chapter, in clearing up the obscure points. In spite of the narrow title, the whole Nibelung tetralogy is included, and Miss Chapin has had the happy thought of dividing each drama into chapters and giving them special names: The Rhine Maidens, The Giants, Nibelheim, The Rainbow Bridge, etc. There are also a dozen full-page illustrations, and some of the more important motives are given in musical type.

The 'Complete Hoyle,' by R. F. Foster (Frederick A. Stokes Co.), declares itself to be an enclyclopædia of all the indoor games played at the present day. As 500 of its 600 pages are devoted to games at cards, the claim may not be extravagant so far as these are concerned. The descriptions of the games are lucid, and as the print of the book, although close, is clear, the manual seems well adapted for its purpose. That it is "the only entirely original book on games that has appeared for 150 years," is a proposition that we shall not attempt to criticise.

Mr. William Gow examines the trade relations of England with her colonies in a pamphlet entitled 'A British Imperial Customs Union' (Edinburgh: David Douglas).

Recent events indicate that no such customs union will be formed, and the scheme suggested by Mr. Gow is therefore not a matter of practical interest. It is, however, a very rational and very ingenious scheme, and as the pamphlet contains also some valuable tables showing the main features of the commerce with the colonies and the duties levied thereon, it deserves preservation.

A portfolio containing sixteen compositions by Clara von Rappard has just been brought out by F. Bruckmann's Verlagsanstalt in Munich, and will soon be accessible to art-lovers in America (New York: George Busse). The artist's name has been favorably known for some years past, her landscapes, portraits, and illustrative compositions, exhibited in the Salon, at the Royal Academy, at Berlin, Munich, and elsewhere, having almost universally won the praise of the critics. Her "Jungfrau in Morning Twilight" will be remembered by visitors to the Woman's Building at the World's Fair. The present collection of etchings, lithographs, and heliotypes—"Studien und Phantasieen" is its title—shows in an eminent degree the peculiar genius of the gifted artist. In some of her conceptions a powerful and sombre imagination, in others a mystic-mythological element, is very strong. A lighter mood characterizes "By the Fireside," and "Gaudeamus," while a delightful humor reveals itself in "Mutual Criticism"—a young mondaine lorgnetting a statue which seems to meet her supercilious glance with an inimitable look of disdain. The strong, pensive faces in the "Sibyls," and also the symbolic head in "Bad Weather," betray the skilled portraitist.

The latest series of 'La Vie et les Livres' (Paris: Armand Colin & Cie.), is the fourth collection of the *Temps* articles published weekly by the gentle and elegant critic Gaston Deschamps. He has divided the present volume into four parts, according to the character of the works reviewed in each. The last contains the most charming pages of the volume, for it deals largely with Greece, a country which has always awakened the writer's enthusiasm. If, out of the whole work, one were to draw any conclusion concerning M. Deschamps's likes and dislikes, it would be, in the first place, that he believes in breadth of culture rather than in the mandarin excess of erudition, though he is not slow to acknowledge the services to knowledge rendered by the patient digger in forgotten archives or even well-known texts. The second would be that this same love of broad culture should mark the scholastic and academic programmes of France. He is constantly inveighing against the stunting effects of the present system and calling for a change. The third would be that he is not afraid of the reproach of lack of patriotism, as recklessly and unjustly launched in France as with us against all those whose love of country is neither blatant nor otherwise offensive. But, after all, is there very much use in republishing newspaper articles? If M. Deschamps were to give us, instead of these warmed-up reviews, a good and well-connected volume of essays on modern literature, the result would be infinitely more profitable both to himself and us. The newspaper article is very seldom good enough to be reprinted, and such a collection as that of 'La Vie et les Livres' comes perilously near being light literature.

There is absolutely no difference in the case of M. Brisson's work, which is, indeed, of the very lightest. He also publishes a new volume, the third in his series of 'Portraits Intimes' (Colin). It is devoted to interviews of prominent persons in various walks of life, from the great writer, or say the known writer, to the beer-garden singer. If anything can be more essentially local and ephemeral than most of the interviews recorded in this volume, it would be hard to name it. They may possess a certain interest for a certain portion of the Parisian public, but they cannot interest any one else. Here and there a crumb of information is met with: one about Victor Hugo, which is valuable as a proof that the venomous Biré, who lays so much stress on his accuracy as distinguished especially from the poet's inaccuracy, has not always got at the facts; another about Musset and his way of looking on the characters in his plays; and still another about George Sand. But they are only crumbs, and there are only three of them.

A series of articles that were well worth reprinting is found in 'Sur la Côte,' by Charles Le Goffic (Colin). They appeared originally in the *Revue Bleue*, and are delightful and interesting reading. To the lovers of Loti they will commend themselves on account of the story of the original "Frère Yves," whom, however, M. Le Goffic did not meet in the flesh. But the whole book is full of the breath of the salt sea, and takes us into the homes, the boats, the minds themselves of the men of the shore. There are strong and charming descriptions of seascapes, though without the wealth of adjectives in which Clark Russell delights, being all the better for that. There are tales of the old wrecking days, perhaps not so very old; tales of the Icelandic fishing and of the times when privateering was in vogue; reminiscences of the whaling cruises, now wholly abandoned, and common-sense remarks on the way to treat sailors.

A rare and noteworthy patriotism is that which seeks to enrich the literature of a nation. A wealthy Greek of Odessa, Gregor Maraslis, has undertaken to give to his countrymen the masterpieces of the historical, philological, archæological, and philosophical literature of other countries by means of the best possible translations. This work has been intrusted to professors of the University and other scholars, and already parts of Curtius's 'Greek History' and Macaulay's 'History of England' have appeared. Among works in preparation is Prof. Whitney's 'Life and Growth of Language.' The Maraslis library is printed at Athens and is issued in monthly parts of one hundred and sixty large octavo pages, at a very low price.

It is gratifying to learn that the fund which is to maintain the Child Memorial Library at Harvard, for the benefit of the English Department, has nearly reached the sum of eleven thousand dollars. The Library itself has received, in addition, two MSS. and more than three hundred volumes, with which has been merged the special library of the English Department. A start is, therefore, made with some 1,000 volumes. Handsome bookplates have been engraved to mark the collection and to acknowledge gifts.

—It is well known that on our northern frontier no revenue has been reaped from tariffs. The salaries of custom-house officers have eaten up all the duties they have taken in. Had those officials covered into the Treasury what they have received in the way of bribes or hush-money the result would have been otherwise. Still greater gains would have accrued to the public had no dutiable goods eluded the vigilance of frontier guards. These facts first become clear to many Americans when they are shopping in Montreal. They scruple to buy because of the exactions they must pay in carrying purchases home, and are assured by sellers that whatever they buy shall be delivered on the American side of the international boundary. It has always been thus and all along the line. Pike found it so in 1805 even up to the headwaters of the Mississippi. But the most curious light dawns on this matter from a long-forgotten manuscript at Mackinaw. The buildings of Astor in those headquarters of his fur trade are well preserved, and have become the John Jacob Astor Hotel. Among other heirlooms there may be seen the books of the company, and one folio of 200 pages is the letter-book of Ramsay Crooks, western autocrat of the enormous American Fur Co. This volume contains his correspondence for four years, from 1816 to 1820. The letters, still very legible, were copied by hand, the copying-press seeming to be unknown. Those to Astor, who was in fact the Company, are the longest, and give such an inside view of his strategy as it were idle to expect to get from any other source.

—In 1815 the Canadian Northwestern Fur Company were excluded from American territory, and their stock became so depreciated that they sold out their property to Astor at his own price. His bargain, however, did not prove so good as it had appeared, for a host of individual Canadians intercepted the most valuable furs on the way to his agents. He, therefore, by the advice of Crooks, undertook to shut out of the country all foreigners not in his own employ, and to secure from the President blank licenses for Indian traders and agents which he could fill out to suit himself. This "indulgence," as he terms it, he hoped to obtain by correspondence, but was taught better by Crooks, who wrote, "For God's sake, go to Washington unless you are very sure of obtaining what we want without making so disagreeable a journey." He went, but after all in vain. But Crooks had better success in Detroit, for on June 23, 1817, he wrote to Astor: "Governor Cass, although positively instructed to be guided by the orders of the War Department of last year in regard to the granting of licenses to foreigners, and having no directions from Secretary Graham to bestow any specific indulgence on your agents, has written Major Puthuff [in command in all the region around Mackinaw] to attend particularly to our wishes; and should he act as the discretionary nature of his orders will allow, he can serve our purpose almost as effectually as if foreigners had been excluded generally, and we had obtained the number of licenses in blank you at one time so confidently expected." Yet in his relations to Puthuff the course of Crooks did not run smooth. In fact there was no true love betwen them. Puthuff held that "corruption wins not more than honesty." Worse than all, Crooks found to his dismay that his agents throughout the wilderness of the West encountered rivals who undersold them at every point. The reason was plain: he had paid a heavy duty —they were smugglers one and all. His

first campaign, though managed with great sagacity, turned out a losing business—a new experience for Crooks. Thereupon his casuistry was that of the saloon-keeper who says, "If I do not sell, others will." So Crooks wrote to Astor: "We must wind up our trade unless you can make arrangements with some London firm which will agree to furnish whatever we need to import, and to deliver the goods to us on our own territory." Crooks knew that such a contract could be easily consummated, since many such houses had made them for decades, opening a commercial underground railroad. The word "smuggle" was not used, but ere long the letters of Crooks were addressed to Mr. Astor in Europe—who had learned that no pen is so good as a personal interview—while the American Fur Company's enterprises thenceforth had free course and were glorified. This tale of truth has as plain a moral as any fable. The more protective a tariff, the more it tempts to immorality, to which it gives a semblance of justification.

—'The Bowdoin and Temple Papers' (Collections of the Massachusetts Historical Society, sixth series, vol. ix.) are far removed in spirit from the excited conditions which preceded and introduced the Revolution. For the most part they are cool and moderate communications between men of no uncertain position, some of English, some of American, birth, but all having that English outspokenness which expects to be taken at its word, and which is also ready to accept the integrity of a disputant. The "Sam Adams" note is conspicuously wanting here; there is, however, no uncertainty in the patriotism of Gov. Bowdoin. His letters and those of his son-in-law John Temple give the occasion of this volume, which otherwise would lack harmony and have small reason for being. Their letters are almost antiphonal in effect. Bowdoin was a high-minded man, distinctly an adherent of the American cause; the other, a gentleman after the standards of the century in which he lived and of the class to which he belonged, but, even to the present day, as is delicately intimated by one at least of the editors, not wholly purged from suspicion in connection with the famous Hutchinson Letters, over which he fought his duel with William Whately. Even in mental attainments the difference between the two men is wide; for while Temple confesses that he "never could write correctly," his father-in-law's breeding showed itself in his excellent but not brilliant style. Among their correspondents were Gen. Gage, George Grenville, Prof. John Winthrop, and William Bollan, and none of the letters in the volume are more important than Bollan's. Of particular interest are the communications to Temple from Thomas Whately, Grenville's private secretary, and afterwards Joint Secretary of the Treasury, a Lord of Trade, and then Under-Secretary of State. With other good advice to the hot-headed Temple, his friend in London was candid enough to say: "To men in office nothing is of more consequence than the utmost temperance of language." Yet, writing this, Whately lived to become a target for the uncomplacent wit of Junius. There follow some interesting letters regarding a proposed expedition to Lake Superior in 1769 to observe the transit of Venus; one from Mauduit mentioning his share in the presentation of the "Pietas et Gratulatio" to George III.; a careful statement by Bowdoin to Bollan of the "Boston Massacre," with a letter by Samuel, Viscount Hood on the same affair.

—The earlier portion of the volume is of the first value. Both sides of the pre-Revolutionary irritations are here discussed with perfect candor, and (to quote the words of Judge Mellen Chamberlain which appear in the latest proceedings of this Society) in the mood of "a dozen intelligent gentlemen in a quiet room—not in a representatives' chamber with galleries full of their constituents—who were desirous of reaching conclusions dishonorable to neither, but advantageous to both parties." The closing papers touch upon the attempted extrication of Temple from any disgrace in connection with the Hutchinson Letters. According to his own affirmation, made here to Franklin, "they were obtained in an honorable way"; but the situation seems not altered. The imputation of invading the privacy of correspondence still lies at the door of Franklin and Temple. Surely the editor would have been wise to print, instead of the rough draught here given (p. 480), the fair copy, dated a day later, of Temple's letter to the General Court of Massachusetts, the original of which is in the Boston Athenæum. A brief tabulation of the letters under the names of the writers would have been a distinct convenience. Eccentricities of editing are rare in the publications of this Society, and therefore we are the more constrained to notice that the transcription, throughout a number of pages, of the contracted "the" of manuscript into the printed "ye" is at variance, not only with the usual practice of the Society, and with the published view of its President, but even with the rest of this volume.

—The late Johannes Brahms detested letter-writing more even than Chopin, of whom it was said that, rather than write a note, he would take a cab and drive from one end of Paris to the other to deliver his message. Nevertheless, there is a considerable number of Chopin letters, whereas of Brahms's there are hardly any. Some years ago La Mara (Marie Lipsius) published a volume of 'Kunstlerbriefe,' containing specimens of letters by eminent composers with their autograph signatures. In some way or other she managed to secure a few of Brahms's letters, but was conscientious enough to ask his permission to print them. He refused it, but, by way of atonement, wrote her a letter of some length with permission to print that. In this letter he took occasion to say that no one could possibly do him a worse turn than by publishing his letters, because he never wrote any except unwillingly and in haste. Nevertheless, his most intimate friend, Dr. Hanslick, has lately printed in several numbers of the Vienna *Neue Freie Presse* his reminiscences of Brahms, interweaving with them a dozen or more Brahms letters written at various intervals, beginning in 1863. In one of these Brahms makes a very sensible suggestion regarding complete editions of the composers: "You know my old favorite wish, that the so-called complete works of our masters—even those of the first rank and certainly those of the second—should not be printed too complete, but that, on the other hand, absolutely complete copies of them should be made for the libraries. You know how eager I have always been to come across their unprinted works. But of many of my favorite composers I do not wish to see everything printed." In September, 1878, Brahms had been invited to attend a music festival at Hamburg at which one of his symphonies was to be produced. The committee was unable to get a definite answer from him, whereupon it appealed to Hanslick, asking him to serve as intermediary. But Brahms wrote to his friend that, in spite of his questions, not a word had been said to him about honorarium or travelling expenses, which was rather hard on a poor musician. He also expressed a fear that unless Joachim conducted his symphony it would go wretchedly. Nevertheless, he went to Hamburg, conducted the symphony himself, and received a great ovation. In several of the letters Brahms expresses his pleasure at the cordial letters Hanslick had written to him praising some of his new pieces as they appeared. He was particularly pleased with the praise bestowed on the song "Vergebliches Ständchen": "This time you have hit the bull's-eye! For that one song I myself would give all the others, and the W.-album in addition." In various short notes complimentary references are made to Goetz, Dvořák, Reinhold, Mandizewsky, Novak, and especially Perger, whose chamber music he repeatedly lauds in the strongest terms. There is also a slight sneer at Bruckner, but such personal references, complimentary or otherwise, are rare in his letters. In one of his notes from Hamburg he expresses great delight because Hans von Bülow, "who never lacks happy thoughts," had planned to close a music festival with three Strauss waltzes.

—It must be admitted that most of Brahms's letters are as dry as the dryest of his compositions. Much more interesting are Hanslick's reminiscences. It appears from these that Brahms, while he wrote most of his works in Vienna, never had more than one pupil—Frau Nenda-Bernstein—during all the years he lived there. Twice he was director of musical societies, but only three years altogether. Regarding the Hungarian Dances, which first established Brahms's popularity, Hanslick reveals the interesting fact that not all of them are mere arrangements of national melodies, but that two of them are of Brahms's own invention. He does not state which. Touching these dances Brahms wrote: "You know that, for an exception, these pieces have amused me too somewhat." Regarding Brahms's letters Hanslick says that he wrote very rapidly and with a quill. Place and date are usually missing, and in lieu of his full name he always signed himself J. Br., partly as a defensive measure against autograph hunters. When personally appealed to for an autograph, he usually ruled five irregular lines, scribbled two or three bars of music, and put his name under it. So little faith had he in his letter-writing faculty that whenever he had an official note of importance to write he always submitted a sketch of it to Hanslick. He was chary, too, of letters written to himself. When Bülow's widow published her late husband's correspondence, knowing that Brahms had some enthusiastic letters from him, she begged him to let her have copies for her book, whereupon Brahms selected a few short and formal notes, intending to submit those, but Hanslick interposed and induced him to send the others, in justice to Bülow.

BELLAMY'S UTOPIA.

Equality. By Edward Bellamy. D. Appleton & Co. 1897.

We have read Mr. Bellamy's 'Equality' with a good deal of interest and entertainment, though we fear it will not have the run of the story of which it is the sequel. 'Looking Backward' was a clever piece of literary work, which had some of the interest of a novel, besides the fascination of all ingenious speculation about the future of the world. In the author's present venture he has undertaken a reply to the critics of the other, and 'Equality' is therefore a somewhat controversial explanation of his social system or Utopia. The characters are the same as in 'Looking Backward,' Julian West, Edith Leete, and Dr. Leete, and the time is still the year 2000; but the book is not a novel; it is a philosophical essay in the form of dialogue and exposition, designed to work out the author's coöperative substitute for the present industrial and political system, and show it in detail. This is, for any idealist, an attempt full of danger, but especially so in a socialistic book. If Mr. Bellamy's second attempt does not have the effect of destroying much of the work accomplished by 'Looking Backward,' we shall be forced to consider that socialist delusions have obtained a stronger hold on the world than we had ever supposed possible.

The book is rightly called 'Equality,' for it is an attempt to solve the problems of life by means of an elaborate application of a doctrine represented by that phrase. The fundamental idea underlying it is that an artificial inequality produces all the evils of life, and enables capital to oppress labor, the rich to harry the poor, and so on. Mr. Bellamy has inherited this idea from the doctrinaires of a hundred years ago, but he insists that their application of it, while it had the effect of removing many an ancient abuse and privilege, has been far from introducing any actual equality of condition among mankind. It has, in fact, resulted in the present régime of competition, which, in his opinion, aggravates the inequalities of life. The obvious deduction from this view is that our forefathers did not go far enough. Had they introduced an absolute equality of condition, and found the means of preventing any lapses from it, the problem would have been solved. This means is furnished by coöperative socialism. The State takes all the property and means of production, making each individual a shareholder on the coöperative plan, allots to him the work he is to do, and lets him have his share of the product. There are no profits, each individual receiving his aliquot share from time to time. No one can accumulate, and hence no one can become rich; inequality is a thing of the past.

Two very serious objections have been urged against such a scheme for the regeneration of mankind: one, that inequality is at bottom not the result of artificial arrangements, but is a fundamental fact in human life, which no amount of human arrangement will ever do away with; the other is that, at the best, the scheme merely results in leaving things where they were. The total wealth of the world is not affected by changing the ownership and distribution of it; and if the total product is divided by the number of souls in any community, a very simple calculation shows that each one of the poor would be little better off than he is now, while the well-to-do would be all reduced to poverty. Economists have shown over and over again that socialistic theories all rest on the assumption of the existence somewhere of an enormous fund of wealth, which, if we could only get at it, would make us all comfortable for life. The novelty of Mr. Bellamy's position as a Socialist is that he does not pass this entirely over, but attempts to meet and overcome the objections raised. The first he meets with a flat denial, and the second with the assertion that there is such a fund, and that if we would look about us we should see it.

What he has to say on these two points is fully set forth in chapter xiii. (pp. 88, 89). The main factor in the production of wealth, Dr. Leete explains to Julian West, is the machinery of associated labor and exchange. "The element in the total industrial product which is due to the social organism is represented by the difference between the value of what one man produces as a worker in connection with the social organization, and what he could produce in a condition of isolation." This difference in value, which, under the rule of competition, is scrambled for, would, under a socialistic scheme, be the common property of all. "Toiling in isolation, human experience has found" that a man "would be fortunate if he could at the utmost produce enough to keep himself alive." Working in concert with his fellows, however, he and they "produce *enough to support all in the highest luxury and refinement.*" The effect of the revolution, therefore, will be that, instead of there being millions for some and nothing for the rest, as now, every one will have at least an income of $4,000 a year, that being the "annual credit" for the year 2000 (p. 29). In other words, the fund is here, but misappropriated. Let Society reclaim it, and the problem is solved.

With inequality Mr. Bellamy deals no less trenchantly:

> "If the modern man, by the aid of the social machinery, can produce fifty dollars' worth of product where he could produce not over a quarter of a dollar's worth without society, then forty-nine dollars and three-quarters out of every fifty dollars must be credited to the social fund to be equally distributed. The industrial efficiency of two men working without society might have differed as two to one—that is, while one man was able to produce a full quarter dollar's worth of work a day, the other could produce only twelve and a half cents' worth. This was a very great difference under those circumstances, but twelve and a half cents is so slight a proportion of fifty dollars as not to be worth mentioning."

There are two or three rather serious defects in this reasoning; one lies in the assumption that because man in existing society can do better work than in isolation, therefore, with a reorganization based on the abolition of private property, he would go on working and producing as at present. What is the connection between the two propositions? Another is the idea that the inequalities between human beings are only those represented by their differences as manual laborers. In a single family the inequalities are such that great distinction of mind or character is seldom repeated in two generations; on the contrary, the son of a man of great vigor of intellect and character is usually not a man of any note whatever. The historical view of the matter is that inequality is the natural law of the universe, and that equality, when we succeed in introducing it, in the interest of humanity and justice, is artificial. Mr. Bellamy's idea seems to be that all this is upset by the fact that one day laborer earns about as much as another. There can be no doubt whatever that, in a period of universal suffrage, if the majority of mankind, or of any community, could be persuaded, through such arguments, that by merely vesting the title to all property in the State, and going to work on the coöperative plan, each person could get $4,000 a year, the existing order would not stand for six months. But are they persuasive?

Every man has an indefeasible right to represent Utopia in any way that he pleases, and there will probably be a good deal of difference of opinion as to whether Mr. Bellamy's "Republic of the Golden Rule" is, in other respects than this immediate universal enrichment, an agreeable place. It is a place where independence of one's fellows in any degree is unattainable, where labor is forced, and ambition and the desire to excel is "treason to humanity." We have looked with some curiosity to see how the author provides for the certainly not impossible case of idleness, or lack of desire to cooperate. He seems to have nothing for it but a sort of exile; but then he makes labor under the new régime attractive. In a society in which man is naturally fond of work, and does not regard ease as the highest good, this problem does not really exist. But Mr. Bellamy gets over a good many other difficulties in the same way. The reader, if not on the watch, will hardly observe how he introduces here a new machine, there a new pleasure, and again a new motive, all tending to the increase of human happiness, while leaving the reader to attribute the change to Equality. There is certainly no connection between the "multiplication of power" and socialism, for all our greatest labor-saving inventions have been produced under the present individualistic system.

We are obliged to admit that the conception of life with our desires all gratified, and nothing either to hope or fear from fate or from ourselves, is, to our minds, one which, even on an income of $4,000 per capita, represents a somewhat infantile ideal. If we say that our desires are gratified, we must be, by definition, happy; yet can we conceive of happiness without its opposite? Is not the struggle with evil in its various forms the price of all enjoyment? Is not this struggle but another term for life itself? These questions will suggest themselves to the reader, but he will find no answer in Mr. Bellamy's pages.

The fact is, that though Mr. Bellamy represents his highly virtuous community as all at work, and glad to be at work, he has reduced their hours of labor, by means of labor-saving machinery and the "new chemistry," to such a point that their work has become play, and the tasks set by Society become a sort of children's game, in which the stress and agony of life are quite gone, and, in their stead, we press a button, bear gently on a lever, or turn a switch, while Equality does the rest. Thus, in reality, although a great deal is said about work, we find, in the end, that there is little or none, and that, strange as it may seem, after all, what our Utopian guide has had in mind all along, though he has cleverly concealed it, is the

old dream of a paradise of sloth and ease. No wonder that in such a heaven individual ambition has become treason. It has never occurred to Mr. Bellamy that the reason why such a paradise is attractive to the multitude may be because man is an animal fond of sloth and ease, and that it is to this fondness that much of the inequality in life is attributable. The irony of life was surely never better illustrated than by the fact that thousands should cherish as their ideal a condition which everybody recognizes as being for his neighbor undesirable.

Whether as a literary man, or an economical writer, the world at large seems little likely to accept Mr. Bellamy at his own valuation. It is difficult to define his position, but he certainly belongs to a class apart, a prophet not without honor in his own and other countries, but in the domain of letters and knowledge not recognizable as having any special standing at all. Perhaps, if we said that, without being a charlatan, he does the work of a charlatan, we should not be far from right. As kings formerly had heralds to announce their approach, demagogues have their literary trumpeters who prepare the way for them; and when they propose crazy popular crusades against windmills, are sure to be preceded by preachers of the word and sowers of the seed. This work is nowadays greatly aided by the fact that a superficial education widely disseminated has made the whole world readers without making them good judges of what they read; and the result of this is that, outside the educated world—the world which has a continuous tradition of life and knowledge and literature—there exists a cosmos in which knowledge begins over again with each new generation, and in which millions of readers spend their lives in raising and discussing anew problems known by their more lucky and instructed fellow-creatures either to be settled and done with or to be insoluble. Just as there are pseudo-scientific inquirers ready to enter with keen zest into the question of perpetual motion and even the truth of the Copernican system and the curvature of the earth, so there are vast hordes of readers who will rush to buy books on any social question, and especially entertaining stories professing to have discovered the key to the regeneration of the world. This is the opportunity of writers like Mr. Bellamy. They can no more help writing than the others can reading. They fancy that they have a message to deliver, and lift up their voices and deliver their apologues with the zeal and unction of true prophets.

These facts explain many a contemporary reputation. Formerly any one who had fifty thousand readers was almost necessarily a man of real literary distinction, for the reason that the whole body of readers belonged to the comparatively instructed class. Education was hard to get, and meant the expenditure of time and money. The educated reading class corresponded roughly to the well-to-do class, who preserved all the traditions of life, society, and property. Now, for every one of these there are a hundred readers who have had all the avenues to speculation opened to them, without ever having been taught to think. For this multitude instructors come forward, themselves not more than half educated, who revive questions long disposed of, having no interest for the really educated, and raise a clamor over them which completely drowns the voice of real knowledge. Mr. Bellamy has got his notion of Equality from Jefferson and Jefferson's teachers, and undertakes to apply it to everything with a true doctrinaire's passion for uniformity. To make his preaching attractive, he has artfully appealed to the ruling and universal passion for wealth, and with his socialist wand has called up a world in which applied Equality produces for every one an easy life on $4,000 a year furnished by somebody else.

The Genesis of Shakespeare's Art: A Study of his Sonnets and Poems. By Edwin James Dunning. Boston: Lee & Shepard. 1897.

The subjection of Shakspere, especially the Shakspere of the Sonnets, to a process of cryptic interpretation has become one of the abnormal but recognized phenomena of the day. It has been variously urged that these "deep-brained Sonnets" embody an allegory of Beauty, of Reason, of Immortality, of the Catholic Church, of Dramatic Art, or of the Evolution of the Ideal. The book whose title we give above, combines two of these theories, and, making a coherent series of the "Venus and Adonis," the Sonnets, and "The Lover's Complaint," reads into it the story of the genesis of Shakspere's art and of the evolution of his poetic ideal.

The process is simple and obvious. Consider the matter. Has not the 'Odyssey' been regarded as an allegory, even by eminent classical scholars? Did not Dante write with perpetual symbolism? Has not Emerson said that Shakspere's Sonnets "deserve to be studied in the critical manner in which the Italians explain the verses of Dante and Petrarch," and was it not the fashion of some of the great humanists of the Renaissance to interpret these verses allegorically? May we not refer to the example of Giordano Bruno, who wrote cryptic verse of his own (to which, it is true, he appended a prose commentary and interpretation), and have not several of the critics tried to establish the theory of a relationship of some sort between him and Shakspere? Did not Keats write that "Shakspere led a life of allegory; his works are the comments on it"? And has it not always been a customary thing for poets to figure forth the genesis of their art in their poetry, as, for recent example, Wordsworth in his "Prelude," or Swinburne in his "Thalassius"? Here in the case of Shakspere then we have a series or sequence of poems presenting a curious mixture of pieces, some of apparently universal and philosophic significance, others of intensely personal bearing, and still others perhaps of little or no meaning except as mere exercises in versification. Many of these poems, if taken literally, are difficult of explanation from all the evidence which we are able to command, if not quite inexplicable. How are we ever to reduce final order out of all this most admired confusion except by the method of allegorical interpretation? For order we must have in some way, by hook or by crook, if it costs us a thousand guesses to set us right! How can a generation nursed on the two dugs of science and of transcendental idealism be expected to tolerate uncertainty in matters of literary interpretation, evidence or no evidence, when theories are to be had for the asking?

Mr. Dunning offers as his guess a theory of ultra-idealistic bias. He sees in the Youth of the first series of the Sonnets, who likewise is prefigured in the Adonis of "Venus and Adonis," Shakspere's "personified poetic Ideal," and in the Dark Lady of the last series the contending influence of the element of Realism in Shakspere's art. The test of such an hypothesis is to apply it independently to the sonnets in question and see whether it really explains them and leaves them fuller of meaning for us. Artistic symbolism there obviously is in many of these poems. A poetic idealism and worship of beauty akin to that expressed in the classic passage from Marlowe's "Tamburlaine," beginning,

"If all the pens that ever poets held,"

are apparent in most of them. A few of the Sonnets, it is not to be denied, are prettily explained by the new theory, as, for example, those numbered 29, 43, 66, 68, and 126. Yet even in these the literal interpretation is the more obvious, natural, and effective. And what shall be the fate of others, such as Sonnets 30, 71, 73, 90, 109, 110, and 111, in which the personal meaning is so deep and strenuous and unmistakable? Read as mere allegories of the "poetic Ideal," these and many others like them pale their ineffectual fires and become as languid and passionless as the thinnest of metaphysical verse. Allegory will never do: it robs us of the poetry of our Sonnets in order to put a bastard philosophy in its place.

Mr. Dunning has expounded his theory with quiet address and fluency, although his initial assumptions and the absence of all logical or argumentative presentation make us suspect that the book is intended only for the true believers, and is not addressed to the Gentiles. The author has done a service, at any rate, in calling attention to many motives, common to the Sonnets and the other poems and the plays, which are unnoticed by other commentators. The fact, however, that similar motives are often to be found in other literature of the age, in which no allegory can possibly be concealed, is overlooked by Mr. Dunning as by so many other writers on the Sonnets. Yet if we must have an allegory, the one here expounded is as innocuous as any yet offered, and is more consistent with poetic probability than any other. It is true that, like the rest, it is pretty much cut out of whole cloth, that it emasculates the real beauty and human passion of most of the Sonnets, and that it really fails to help us to understand (other than in the most arbitrary way) the allusions and the concrete symbolism of these lyrics of the inner life; but at least it presents us Shakspere as an artist and poet interested in the problems of his art, rather than as a metaphysician, or as a controversialist, or as the bearer of an orphic message to his times. The interpretation has to be unduly stretched to cover the difficulties presented in such a sonnet as the 35th; on such sonnets as the 84th and the 102d it becomes manifestly hypersubtle and impossible; and to us, at least, the results of applying this method to the intense, human, and concrete passion of the Dark Lady series are nothing less than grotesque. That this series should be but a veiled argument on the theme of Realism vs. Idealism! One can imagine Shakspere rubbing his eyes with astonishment, if, where he dwells in the Elysian fields, word could be brought him of the fantastic ulte-

rior meanings that a later world is reading into his lyric exercises.

"Others abide our question, Thou art free.
We ask and ask—Thou smilest and art still,
Out-topping knowledge."

Two tempting corollaries inherent in his demonstration are neglected by the author. If the Sonnets and the poems are an allegory of the genesis of Shakspere's art, obviously the capstone of the whole edifice is supplied in the "Tempest." *Ferdinand* is the Youth of the Sonnets, and once more *Ariel* is the personification of the poetic Ideal or the poetic Imagination ("Where the bee sucks, there suck I"); *Caliban* is implacable Realism; and *Prospero* is the type of the poet himself (did Shakspere act the part?), who in the end breaks his wand and abandons his art for good and all ("Now my charms are all o'erthrown"—and see the rest of the Epilogue). Again, if the rivalry with the Rival Poet is one of art only, and if the contest between the two is over the common theme of poetic Beauty, why may not Spenser and the "Hymn of Heavenly Beauty" be hinted at? The "Four Hymns" were not published until 1596, and it is possible that the Sonnets were written at about that date. Moreover, "the proud full sail of his great verse" is a phrase which admirably characterizes Spenser's full and splendid rhythm, while it is remarkable that in Sonnet 85 Shakspere speaks of "every *hymn* that able spirit affords." Clearly Spenser is to be considered if we can only establish a basis of rivalry with Shakspere; and that is afforded if we accept the theory that Shakspere's envy is the result of purely professional jealousy of one whom he magnanimously accounts the greater "poet"—an envy, it is obvious, more plausibly directed against Spenser than Chapman—and that his emulation of this poet is purely concerned with the celebration of the common "master-mistress" of the two, poetic Beauty. The allegorical method should not stop short with results only partially worked out and finished!

The Dawn of Modern Geography: A History of Exploration and Geographical Science from the Conversion of the Roman Empire to A. D. 900. By C. Raymond Beazley, M.A., F.R.G.S. London: John Murray. 1897. 8vo, pp. xvi., 538.

Although no modern people has contributed so much to man's stock of earth-knowledge as the English, systematic accounts of the process have been strangely lacking in the English language. It is now more than two generations since the whole field was covered by an English writer, W. Desborough Cooley, in his 'History of Maritime and Inland Discovery.' Meanwhile, English geographical literature has been enormously enriched. It is high time, then, that the coördination and presentation of all this material should be undertaken in behalf of the English student. The late E. H. Bunbury laid a solid and enduring foundation for such a work in his treatise on Ancient Geography, but the more arduous and forbidding task of penetrating the dark continent of early mediæval geography, not hitherto attempted except in a fragmentary way, has now been undertaken by Mr. Beazley with an energy and zeal that deserve warm recognition.

'The Dawn of Modern Geography' deals with the state of geographical knowledge during the six centuries from the conversion of Constantine to the migrations of the Northmen. It is more in accord with our traditional views of the middle ages to regard this period as one of decay rather than as one of slow recovery, but Mr. Beazley makes it clear that the process of decay had been going on rapidly for a century before Diocletian. Such writers as Solinus and Martianus Capella, who became the authorities for the middle ages, were little above the intellectual level of their followers. From the ruins of the temple of ancient science they saved only the gargoyles. The real clue to this loss seems to have been, in part at least, the diversion of intellectual interests from the things of this world to those of the next. Yet in this very diversion of interests there is a glimmer betokening the coming dawn, for the concentration of thought upon heavenly things invested with irresistible fascination those regions of earth which were the scenes of sacred story. And so, in the early narratives of Pilgrims to the Holy Land we find the dim beginnings of a movement which culminated in the splendid achievements of the age of Prince Henry and Columbus.

Mr. Beazley's work consists of four parts: an account of the pilgrimage literature, of commercial and missionary travel, of the contemporary theory, and of early Arabic and Chinese geography. The first two divisions are the most interesting and novel, and, with the third, constitute a highly important contribution to our knowledge of the intellectual condition of the early middle ages. Pilgrimages to the Holy Land, whose beginning antedates any authentic record, took on a new life after the visit of the Empress Mother Helena in 326, which was rewarded by the finding of the true cross, and by 333 we have in the Bordeaux Itinerary the first Christian guidebook to the Holy Land. That pilgrimages were already an old custom is fully attested by the wonderfully varied identification of the sites and relics of Biblical history. For example, in or near Jericho, the Bordeaux Pilgrim is shown the sycamore of Zaccheus, the house of Rahab the harlot, the spot where the Ark of the Covenant rested, and the twelve stones which the children of Israel brought out of the Jordan. Going from Jerusalem to Bethlehem the traveller visits the tombs of Rachel, Ezekiel, Asaph, Job, Jesse, David, and Solomon. Fourteen miles further on is the fountain where Philip baptized the eunuch, and at Mamre the pilgrim can sit under the shade of the oak that sheltered Abraham when he entertained the angels. The next important stage in pilgrim travel is marked by St. Jerome's residence in Bethlehem, and the most interesting narrative of this period is that attributed to Sylvia of Aquitaine, which was first made known in 1883. It is supposed to have been written about the year 380, and is an exceptionally full and independent account of the personal experiences of a lady from southern Gaul who spent four years in the East, going in one or two instances beyond the bounds of the Roman Empire. A translation of Sylvia's narrative was published by the Palestine Pilgrims' Text Society in 1891.

The inroads of the Barbarians seem to have increased the number of religious travellers, and for the next forty years pilgrimages were very frequent. Jerome wrote that ladies from Rome "filled all the cities" of the East. About the middle of the fifth century there is a falling off, followed by a recovery in the age of Justinian. As time goes on, the passion for relics becomes more greedy and less discriminating. The handbooks of this period are often only catalogues of these marvels. In the 'Breviarius de Hierosolyma,' 527-530, the demands of the most restless curiosity could hardly fail of measurable satisfaction. The reader is informed where he may see "the holy lance made of the wood of the Cross, which shines at night like the sun in the glory of the day"; "the horn with which David and Solomon were anointed"; "the earth of which Adam was formed"; "the stone with which Stephen was stoned," etc. In this later period the most curious and interesting narrative is that of Antonine of Piacenza, written about 570. He is far more credulous than Sylvia. To her disappointment, she found that the pillar of salt into which Lot's wife was turned was no longer to be seen. "Believe me," she writes, "the pillar itself was not visible, only the place is shown. The pillar itself is said to be covered in the Dead Sea. We saw the place, but no pillar; I cannot deceive you about this matter." Antonine, on the other hand, has no difficulty, and takes the pains to correct the false report as to Lot's wife and her pillar of salt, "that she is diminished in size by the licking of animals." He found the statue just the same as it had always been. At the Red Sea he visited the scene of the miraculous passage of the Israelites, then a tidal gulf, where, he says, at ebb-tide could still be seen the traces of Pharaoh's army and the marks of his chariot-wheels, "but all the arms have been turned into marble." The rise of Mohammedanism interrupted pilgrim travel for nearly a century. Late in the seventh century comes a revival, and the documents of this period have long been familiar in Wright's 'Early Travels in Palestine.'

Mr. Beazley's critical review of the history of geographical theory begins with the 'Collectanea' of Julius Solinus, whose compilation of curiosities from Pliny became a standard source of geographical eccentricities for a thousand years. Solinus probably wrote before 300 A. D., and it is a striking symptom of the advancing intellectual decay in the third century that his knowledge of the earth's surface is far behind that of Herodotus. Cosmas Indicopleustes is next taken up as the forerunner of the Biblical literalists. Mr. Beazley finds, however, that his 'Christian Topography' had only a slight influence on subsequent writers.

It has been possible to touch upon only a portion of the contents of Mr. Beazley's volume. The chapters on the early maps, on missionary and commercial travel, and on Arabian and Chinese geography are all interesting, the first especially so. In covering so extensive a field, almost as an explorer, it is not surprising that the author should make some slips, yet one is hardly prepared to find him citing as an instance of the ignorance of the Ravenna geographer that "Jornandes, the historian of the Goths, though professedly one of his main authorities, regularly appears as Jordanis," p. 305. As a whole, the work is an exceptional contribution to our knowledge, and deserves a grateful reception not only from the students of history and geography, but from all who enjoy the literature of travel.

Dante in America: An Historical and Bibliographical Study. By Theodore W. Koch. Boston: Ginn & Co. (for the Dante Society). 1896.

The Treatment of Nature in Dante's Divina Commedia. By L. Oscar Kuhns. Edward Arnold. 1897.

The first half of Mr. Koch's volume is taken up with brief and somewhat amateurish sketches of famous American Dante scholars. Those relating to Ticknor, Longfellow, Parsons, Lowell, and Norton seem to contain nothing that is new; but with regard to Da Ponte, the romantic librettist of Mozart, who was the first to introduce the study of Dante into the New World, and the less known Richard Henry Wilde, whose important share in the discovery of the Bargello portrait has been lost sight of, the author has collected some exceedingly interesting information. The second and more valuable part of the volume consists of a detailed bibliography—as complete as possible—of all that has been published in the United States about Dante, including translations and even magazine articles and important book-reviews. In such work Mr. Koch is an expert, and his record of American thought and interest for nearly a century makes it worth while for us to review for a moment the period, with the object of seeing what of importance has really been accomplished in it.

American acquaintance with Dante seems certainly to have begun in New York, under the stimulus of Da Ponte, but deep interest in his works has, until recent years, been confined almost entirely to New England. Elsewhere he was read with an amateur's admiration and affection; it was only on the ground which the Puritans sowed thick with ethical and religious aspirations that study of the great moral allegory became more than a dilettante's pastime. As early as 1839 Longfellow translated a few passages from the "Purgatory" in his "Voices of the Night." In 1841 appeared Parsons's "Lines on a Bust of Dante," comparable with any of its class in the whole range of modern literature; in 1843, his remarkable version of the first ten cantos of the "Inferno." In 1867, Longfellow's translation of the whole 'Divine Comedy' was published; Parsons's of the "Inferno"; and Norton's of the 'New Life.' Lowell's well-known essay first appeared in 1872. From that time until 1888, the date of Dr. Fay's 'Concordance,' nothing of value was done, and with 1891, the date of Mr. Norton's translation, the brief list of important works comes to an end, unless we include Mr. Latham's version of Dante's 'Letters' (1891); Miss Hilliard's of the 'Banquet' (1889); Dr. Harris's suggestive 'Spiritual Sense of the Divine Comedy' (1889), and Mr. Lane's model 'Bibliography' (1890).

Small as this product is, it is an important one. We have three excellent translations, from different points of view, of the 'Divine Comedy,' the great Concordance, and an essay that has done much to widen the knowledge and appreciation of Dante's works. France has done far less, Germany and England not more. Indeed, in Italy itself the great poet, though more a name to worship conventionally, and though to a greater degree the subject of antiquarian and exegetical research, has not often been studied with so open a mind, with so little political and religious prejudice, as in this republic.

But the test of a poet's greatness or of love for him lies in the hearts of his readers, not in books about him. To the people at large the 'Divine Comedy' will always be a sealed book; its mastery demands too frequent readings, too protracted effort. There are many signs, however, that Dante's poem has brought to not a few of us (not merely men of learning) congenial and strengthening ethical and æsthetic conceptions, and that its best teachings have thus been absorbed, not without an effect on character, into our national life. It is at once unfortunate that the recent exodus of our young men into the wilderness of mere linguistic research has apparently greatly diminished, for some years, the powerful attraction of Dante for students of letters, and fortunate that the university-extension movement and kindred projects, dangerously superficial though they may sometimes be, have done so much to bring Dante before the people.

Prof. Kuhns's volume is Germanic in its scope and trend, for it takes account of all Dante's references to the outward physical world that is not the handiwork of man. It is, however, characteristically American in its practical treatment of the subject. It has a good index, and the whole mass of matter is classified in such a sensible fashion that no one can fail either to find in the volume any particular group of facts or to get a general survey of the field. We miss, however, a full discussion of what seems to us the most important question with regard to the whole matter: How far is Dante's feeling for nature in accord with our own, and how and what does it add to our pleasure? The point has been often raised but never fairly settled—certainly never on the basis of such an array of facts as Prof. Kuhns's industry and accuracy have at last provided. It is to be hoped some competent person may now give this deeper side of Dante's treatment of nature careful consideration. Of course, the necessities of rapid narrative and preoccupation with ethical matters make Dante's references to nature wholly cursory. It is evident, however, that he took pleasure, as we do, in observing and recalling simple and striking scenes, that he was interested in the habits and bearing of men and animals, and particularly moved by effects of light. He differs from us in a certain city-bred quality that shows itself in odd ways. The real forest was strange and horrible to him, as it is not to us in this athletic modern time; his flowers were garden flowers; birds, except the larger species, he scarcely noticed; for horses and dogs he does not seem to have cared. He anticipated our curious thrill of delicate awe and pleasure before the sea and the stars, though, disdainful of adjectives, he never read into nature what is not plainly there for the normal man. Notwithstanding that his whole poem is a parable, it was only on rare occasions, which should be carefully enumerated, that, like holy writ, he availed himself of physical imagery for the specific statement of spiritual truths. These are slight hints, and subject to correction.

Arnold of Rugby: His School Life and Contributions to Education. Edited by J. J. Findlay, M.A., with an introduction by the Bishop of Hereford. Cambridge (Eng.): University Press; New York: Macmillan Co. 1897.

This book is almost entirely a compilation from Stanley's 'Life' and from Arnold's own sermons and miscellaneous writings. The original part consists of a preface, an introduction; a bibliography of Arnold, Rugby, and Public School literature; and an almost fantastically elaborate analytical index to the whole book. It is not very easy to see the reason for its compilation at all. The materials which make up the bulk of it have been long before the world and have attained a wide circulation. As the author himself intimates, the popular opinion in England of Arnold, now that he has been dead more than half a century, is made up, and may be accepted, unless by minute critics. Certainly nothing is to be obtained for Englishmen from such material as this book contains to illustrate or correct that view.

With Americans it is somewhat different, and the contents of this volume may have a use in showing Arnold as he really was. There is an Arnold legend, one might say myth, prevailing in the United States, like the Tory myth of Pitt, spoken of by Macaulay. Up to the appearance of 'School Days at Rugby' in 1858, though Stanley's 'Life' had been published for more than ten years, Americans generally were in deep ignorance of Arnold, of Rugby, and of the English public schools as a class; an ignorance not lessened by the totally different acceptation of the term "public school" in the two countries. 'Tom Brown' created an excitement unparalleled on such a theme. It at once gave currency to an ideal view of Arnold and his services. Stanley's 'Life' was reread, and Arnold exhibited as the model educator, who had revolutionized by precept and example all the schools of England, and whose pattern all American schoolmasters would do well to follow. The fact that Thomas Hughes gave his strong sympathy to the North in our civil war increased this cultus, and the three Thomases were confused in a way worthy of the Autocrat's conception of the same name. (The writer of this article has known Dr. Arnold spoken of as the author of 'Tom Brown's School-Days.') Every time an energetic and esteemed schoolmaster died after some years' conspicuous service, he became an "Arnold of America." We can testify from personal knowledge to four such in New England alone.

This legendary view, like all similar views, has been of doubtful service both to Arnold and to his worshippers. Great as were his merits in his own field of action, he was hardly the man to be copied in his own country, and wholly unfit for a model to an American schoolmaster. One of the four "Arnolds of America" mentioned above, who sacrificed his life in the endeavor to build up a model school, succeeded remarkably in almost everything of his own devising, and reasonably in what he took from his own American place of training; his deliberate attempts to copy Arnold's methods were mostly failures. Arnold was a devoted, one might say bigoted, churchman, who could scarcely see a chance of salvation out of the Church of England; yet he was held in his lifetime a heretic and latitudinarian. He was a loyal son of Winchester School, and cherished to the last some of the most antiquated public-school tyrannies, like flogging and fagging; yet he never won the entire confidence of those who believed in the old English public-school system, and many in England now think that that system has been most successfully adapted

to modern needs by the work of other minds than his, or by his pupils, who have discarded some of his hobbies. He was intensely eager to develop each pupil's individual character and to appeal to the best motives in every boy. Yet he scarcely ever succeeded in understanding younger boys, before the age when they could think about becoming men; and it was left for his third successor, the present Archbishop of Canterbury, to release Rugby boys from much of the iron tyranny of an inflexible system, which Arnold could see no sense in relaxing.

That he loved righteousness and hated iniquity; that he made moral and intellectual training go hand in hand; that he came before his pupils as one of themselves, asking their help in raising the school to what they all longed to have it; that his life, in Rugby and out of Rugby, was one long personal appeal to fight for Christian English manhood in all its truth, purity, energy, and self-devotion, and that these qualities are all worthy of admiration and imitation, modified by the patriotism of every country, is as true now as it was in 1842. But when we come to the specific problems he encountered, and the specific arms he used, a thoughtful teacher must pronounce both to be nearly obsolete. It is a very poor eulogium, and one that Arnold would have rejected for himself and regretted for others, to call any one the Arnold of America; and if, as is very probable, a system of large boarding-schools will be extensively developed in the United States, they must not seek to be Rugbys or Etons, nor even new Andovers or Exeters, but adapted to the needs of their age and their pupils by the efforts of men as patriotic, as fearless, as original, as devoted as Thomas Arnold.

BOOKS OF THE WEEK.

Ames, P. W. The Mirror of the Sinful Soul. Published for the Royal Society of Literature. London: Asher & Co.
Browning, Robert. The Pied Piper of Hamelin, and Other Poems. Boston: Houghton, Mifflin & Co. 15c.
Buchan, John. Sir Walter Raleigh. Stanhope Essay, 1897. Oxford: B. H. Blackwell.
Crow, Martha F. Elizabethan Sonnet-Cycles. Idea—Fidessa—Chloris. Chicago: A. C. McClurg & Co. $1.50.
Cumberland, Barlow. The Story of the Union Jack. Toronto: William Briggs. $1.50.
Dulles, Dr. C. W. Accidents and Emergencies. Fifth edition, thoroughly revised and enlarged. Philadelphia: P. Blakiston, Son & Co. $1.

SOME RECENT BOOKS IN SCIENCE, HISTORY, ETC.
PUBLISHED BY
HENRY HOLT & CO.,
29 W. 23d St., NEW YORK. 378 Wabash Ave., CHICAGO.

KINGSLEY'S ELEMENTS OF COMPARATIVE ZOOLOGY.
By Prof. J. S. KINGSLEY of Tufts College. 344 pp. 12mo. (*Sept.* 4.)
Pays much attention to laboratory work, but does not require a compound microscope. Largely inductive in method, containing many helpful questions under "Comparisons," it yet contains all the text-book information of the usual course.

HERTWIG'S ZOOLOGY.
The General Principles. By Prof. RICHARD HERTWIG of the University of Munich. Translated by Prof. GEO. W. FIELD. 8vo, 226 pp., $1.60 *net.*

PACKARD'S ZOOLOGY.
By Prof. A. S. PACKARD of Brown University. *Briefer Course. Revised and enlarged Aug.*, 1897. 358 pp., 12mo, $1.12 *net*

RANDOLPH'S LABORATORY DIRECTIONS IN GENERAL BIOLOGY.
By HARRIET RANDOLPH, Instructor in Bryn Mawr College. (*Sept.*)
Prepared primarily to accompany Sedgewick and Wilson's General Biology. For six hours a week through one year.

HALL & BERGEN'S PHYSICS.
By Prof. E. H. HALL of Harvard and J. T. BERGEN, jr., of the English High School, Boston. *An entirely new and much enlarged edition*, about 600 pp (*Sept.*)
Includes the revised Harvard quantitative experiments, many additional qualitative experiments, and much new discussion of principles with special reference to every-day phenomena.

PIERCE'S PHYSICS PROBLEMS.
1,200 elementary problems, mostly numerical. By E. D. PIERCE of the Hotchkiss School. 194 pp., 12mo, 60c. *net.*

PERKINS' OUTLINES OF ELECTRICITY AND MAGNETISM.
By Prof. C. A. PERKINS of University of Tennessee. 277 pp., $1.10 *net.*

BEAL'S GRASSES OF N. AMERICA.
By Prof. W. J. Beal of Mich. Agricultural College. Profusely Ill'd. Vol. I. $2.50 *net.* Vol. II. $5 *net.*

PRICE'S FERN COLLECTOR.
A Handbook and Herbarium by Miss S. F. PRICE. 72 plates, mostly life size, with botanical guide. 4to, $2.25.
"Excellent figures of our native ferns."—*Nation.*

*MARTIN'S HUMAN BODY.
By the late Prof. H. NEWELL MARTIN. *Advanced Course. Entirely New Ed.* 1896. 685 pp., 8vo, $2.50 *net.*
"Has been accepted by men of science and teachers as a model text-book."—*Science* (New Series.)

WENLEY'S KANT OUTLINE.
An Outline Introductory to Kant's Critique of Pure Reason. By Prof. R. M. WENLEY of the Univ. of Mich. (*Sept.*)
(Watson's Philosophy of Kant. $1.75 *net.*)

JOHNSTON'S UNITED STATES.
A History for schools. By the late Prof. ALEXANDER JOHNSTON. *Revised and Continued through* 1896 by Prof. W. M. DANIELS of Princeton. 499 pp., $1 *net.*
Officially recommended by Harvard, Johns Hopkins, Princeton, Mass. Institute of Technology, Bryn Mawr, the Universities of Mich., Minn., Pa., Iowa, Ohio, etc.

*BOLLES' COMMERCIAL LAW.
The Elements. By A. S. BOLLES, lecturer at the Univ. of Pa. *With very full summaries and index.* 316 pp. 16mo, $1 *net.*

WALKER'S BIMETALLISM.

HATCHARDS.
This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.
Agents for Clubs, Libraries, and all private collectors.

William Penn's Plan for the United States of Europe.

In 1693, one hundred years before Kant wrote his "Eternal Peace," William Penn published a remarkable "Essay towards the Present and Future Peace of Europe," proposing a general union of the nations of Europe, with a federal parliament, as the only sure means of peace. This great essay, almost forgotten, is now added to the Old South Leaflets, being No. 75 in the series. The interest in international arbitration is so great that this essay shou'd be read everywhere. Price, 5 cents a copy; $4 a hundred. Three bound volumes of the Leaflets now ready. Price, $1.50 each. Send for complete lists.

The Macmillan Company's New Books.

HISTORY, MODERN AND ANCIENT.

A NEW VOLUME IN THE PERIODS OF EUROPEAN HISTORY SERIES.

General Editor, ARTHUR HASSALL, Oxford University.

Period IV., 1494-1598. By A. H. JOHNSON, M.A. 12mo, cloth. Price, $1.75 net.

VOLUMES PREVIOUSLY ISSUED:

PERIOD I. A.D. 476-918. By C. W. C. OMAN, M.A., Fellow of All Souls' College, Oxford. **$1.75** *net.*

"Mr. Oman's work is of a high order, both as to scholarship and literary execution. . . . Through his entire work Mr. Oman displays very unusual ability to bring out the critical points and characteristic significance of the history, and to keep the historical perspective as true, and the values as well marked and distinct, in his brief narrative as they would be in a longer one. The series makes, at all events, a highly interesting beginning in Mr. Oman's volume; and nothing better can be hoped for it than that it will hold the same high standard to the end."—*The Independent.*

PERIOD V. A.D. 1598-1715. By H. O. WAKEMAN, M.A., Fellow of All Souls' College, and Tutor of Keble College, Oxford. **$1.40** *net.*

"We have been waiting for just such a series, for use by our students in their study of European history. I am very much pleased with the series. The volumes out seem to combine an accurate grasp of details with that well-considered grasp upon the *important*, which is so essential to the student."—Prof. FREDERICK J. TURNER, *University of Wisconsin.*

PERIOD VII. A.D. 1789-1815. By H. MORSE STEVENS, M.A., Balliol College, Oxford. **$1.40** *net.*

IN PREPARATION.

A Handbook of European History.

By ARTHUR HASSALL, M.A.,

Student of Christ Church, Oxford, General Editor of the "Periods of European History" Series.

Extra Crown 8vo.

It is gotten up somewhat after the plan of Nichols' Historical Tables or the Chronological Outlines of Literature by Ryland and Whitcomb. Parallel columns show what events of importance were taking place in different countries at or about the same time. Germany, Eastern and Southern Europe, England and France are the divisions under which the entries are made. The book cannot fail to be of great value in preventing some of the misconceptions which arise from the too common practice of reading the history of each nation by itself, with only occasional reference to what is going on in other countries during the same time. Following these comparative tables are a few tables of genealogies, lists of sovereigns, etc.

A Student's History of the United States.

By PROF. EDWARD CHANNING.

Harvard University.
Author of The United States, 1765-1865.

Fully illustrated with Maps, Portraits, etc.

The Old Santa Fe Trail.

BY COL. HENRY INMAN,

Late of the U. S. Army.

In Press.

To be illustrated with a Portrait of the Author, a Map of the Trail, full-page illustrations by FREDERIC REMINGTON, and smaller sketches, either made on the spot or redrawn from photographs. The stories wander like the old trail itself through many accidents and incidents, some of them romantic, many highly exciting. They contain sketches of the old trappers and voyageurs, of famous scouts like Kit Carson, who is the hero of a certain story of heroic surgery, highly successful, but crude enough to have happened in the Middle Ages. The book ends appropriately with the passage of the first train over the Atchison, Topeka and Santa Fé Railroad, the event which fully and forever ended the usefulness of the old Santa Fé Trail, whose picturesque life Col Inman is preserving for our own and later generations.

NEW VOLUMES OF

The Temple Classics

Author of "A History of Rome to the Battle of Actium," etc.

Illustrated. Crown 8vo.

There has long been needed a text-book on Roman history which is suited to the present requirements of the college entrance examinations. At one time the so-called primers of the history of Greece and Rome supplied all that was considered necessary, and it has been difficult since to find a text book at once brief enough for the limited time which the high school students can give to the subject, and full enough for use according to modern methods of teaching. The Short History is well supplied with maps, plans, and a few illustrations. Each chapter is preceded by a brief topical outline which is carried through the chapter also in paragraph headings. The last chapter contains a noticeable summary of the condition of the Roman Empire under Augustus, with a brief sketch of the study of literature and art under his protection, and the influence he extended over his wide dominion.

A Political Primer for New York State and City.

THE CITY UNDER THE GREATER NEW YORK CHARTER.

By ADELE M. FIELDE,

Secretary of the League for Political Education.

With Maps.

Sketches From Old Virginia.

By A. G. BRADLEY.

Crown 8vo.

In press.

Contents:—The Doctor—An Old Virginia Fox-hunter—On the Old Bethel Pike—Parkin the Saddler—The "Poor Whites" of the Mountains—The Virginia Quail—Mar'se Dab after the War—Two Episodes on Rumbling Creek—Some Plantation Memories—A Turkey Hunter.

Cameos from English History.

By CHARLOTTE M. YONGE.

NINTH SERIES. Cloth. Globe 8vo.

"This is a good way to study history if one feels any lack of interest in the subject at the outset. The reader can hardly fail to be roused to interest by the narratives of Miss Yonge Her subjects are chosen with a view to their intrinsic interest."—*The Evening Transcript, Boston.*

Books on Natural Science, for Supplementary Reading or the Library.

Citizen Bird.

SCENES FROM BIRD LIFE IN PLAIN ENGLISH.

By MABEL OSGOOD WRIGHT

and

DR. ELLIOTT COUES.

Fifth Thousand. Cloth, **$1.50** *net.*

Birdcraft.

By MABEL OSGOOD WRIGHT.

New and cheaper edition, illustrated by LOUIS AGASSIZ FUERTES.

Cloth, 8vo extra. Price, **$2.50.**

Life Histories of American Insects.

By Prof. CLARENCE M. WEED,

New Hampshire College of Agric. and Mech. Arts.

Freely illustrated. Cloth, cr. 8vo, **$1.50.**

Wild Neighbors.

A BOOK ABOUT ANIMALS.

By ERNEST INGERSOLL.

Chapters on the chief families of wild animals and one on their life in captivity. With 20 full-page plates and other illustrations.

Cloth, cr. 8vo, **$1.50.**

THE MACMILLAN COMPANY, 66 Fifth Ave., New York.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 2, 1897.

The Week.

Both in Nebraska and in Pennsylvania on Thursday, Republican State conventions jubilated over "dollar wheat," and asserted that it had made silver a dead issue. The Pennsylvania platform distinctly says: "Dollar wheat has sounded the death-knell of the free-coinage heresy." This is highly gratifying, and it also contains an undoubted truth. No man with eyes in his head can question the immense political effect, or the advantage to the cause of sound money, produced by wheat's going up in price while silver is going down. But to admit this and rejoice in it is one thing; it is quite another to say that dollar wheat has made an end of free silver. Suppose wheat goes back to 75 or 60 cents next year, as is at least possible, what becomes of the Pennsylvania argument? The dead heresy will prove a very lively corpse. The real moral of the situation is that advantage should be taken of the highly favorable opportunity, not only to ring death-knells of free coinage, but to so lock and bar its tomb that no political resurrectionists can drag it out again to afflict us. If the Republicans were really heart and soul for the gold standard, they would seize instantly on their strategic chance to imbed it in the law of the land beyond question or repeal. "Dollar wheat" would spur them to activity, not lull them into a fool's paradise of confidence that all will be for the best in the best of possible worlds, so long as the Republicans are in power.

The rise in value of the rupee of India coincidently with the fall of silver bullion is as decided as the simultaneous rise of wheat, and is due to the same general cause, *i. e.*, to the law of supply and demand. Wheat has gone up because supply has fallen off as compared with demand. Rupees have advanced because demand has increased as compared with supply. Since the closing of the Indian mints the number of rupees in existence remains fixed; that is, the number cannot be increased, but may be diminished slightly by loss, by fire, or other accident. So, whenever an increase of demand comes, there will be a rise in the price. When the Indian mints were closed, the market value of the rupee was 15¼d. It declined gradually to 13d., and, after fluctuating within narrow limits, began to rise again. The present quotation of the rupee in English money is 15½d., or a little more than the price at which it sold in 1893, when the mints were closed. In the meanwhile silver has fallen so that the bullion value of the rupee is only 9d. The Government of India has made a saving of $25,000,000 per annum on its remittances to Europe by stopping the "free coinage of silver." If the mints had been kept open, the value of the rupee, in which all taxes are collected, would have been exactly that of the silver bullion contained in it. Guided by this experience it is impossible to suppose that the Indian Government will reopen the mints in order to make a new experiment in bimetallism.

Senator Chandler makes a noteworthy admission in his contrite apology to his constituents for not discovering the discriminating-duty clause on foreign goods entering his country through Canada, when he says: "Having had experience with conference reports which should have warned me to read every word of this report, I have no excuse to offer for not doing so. I hope to be forgiven by my constituents, but I shall never forgive myself." That is to say, he knew his colleagues would bear watching, and should not have taken their word for it, solemnly uttered in the Senate, that in this instance they intended to play fair. It would be very interesting, as well as useful, if Mr. Chandler would cite the experiences which he says should have served as a warning to him. Nothing would help so much to break up the practice as a full revelation of its workings, and Mr. Chandler might find some solace for his grief in warding off from other confiding statesmen like woe in the future. He would do well also to insist, when Congress shall come together again, upon such rigid definition and regulation of the powers of conference committees as will make future tricks of the kind impossible.

Lawyers have been in the habit of joking over statutes "through which a coach and four could be driven," but what kind of definition will they invent for the now famous clause 22 of the Dingley bill? The more it is examined the more extraordinary a piece of legislation does it appear to be. Instead of a coach and four, transcontinental railroads and lines of ocean steamships find plenty of room in the clause, and Congress never knew it! It now appears that one of the questions with which the Attorney-General is wrestling is whether clause 22 does not levy a discriminating duty of 10 per cent. on goods imported in vessels of all countries not expressly exempted by treaties. Exemption has previously been made by "act of Congress," but those words were slipped out of the clause in conference, just as the words about a "contiguous country" were slipped in. Thus it is possible that the clause strikes a blow at English and French shipping as well as at the Canadian Pacific Railroad. German, Austrian, and Swedish steamships would be exempt by treaty; but English and French only as respects goods shipped from English and French ports. A good part of their freight would be subject to the discriminating duty.

Now this new "joker" in the bill was just as much a "legislative trick" as was, according to Senator Chandler, the sly insertion of the "contiguous-country" phrase. Mr. Dingley knew nothing about the imposition which was being practised on himself and on Congress. He was asked specifically about this discriminating duty on foreign shipping, and replied that it was merely "an old provision." Of course, the point is, and this is what is worrying the Attorney-General, that the old provision was materially changed in the dark. Senator Allison was asked what change the clause would make, and declared, "It makes no change." Coaches and four are nothing to this. Who was responsible for this subterranean legislation? The *Sun* calls upon him to come forward that a grateful country may honor him for his stupendous success as a jobber. Others would be glad to have him come forward for other reasons. But whoever he is, he seems to be a wonderfully shy and shrinking person. It looks now as if it would take a congressional investigation to make him come out into the public gaze and get his laurels.

President McKinley's remarks before the Grand Army at Buffalo last week were in excellent taste and temper. He is especially to be congratulated on not having repeated the dangerous suggestion which he made to Congress, that more revenue should be raised so that there should be more money for pensions. There is no doubt that the hopes of the pension-agents are high. They confidently expect to get their long-desired service pension out of this Administration. The talk about pensions having now reached the "top-notch" fills them with disgust. They have seen that top-notch before, ever since Garfield located it at some $120,000,000 below the present mark, and have always found means to push it higher. Are there not 450,000 claims now pending? How can there be a top-notch till those are all granted? And it is not to be supposed that the ability of the pension-agents to produce or invent "claims" is by any means exhausted in the number 450,000. They are good for as many more on demand. However discreet Mr.

McKinley may be, we cannot expect other speakers on the Grand Army platform to be so moderate. The President may have been restrained by the depressing revenue returns under the Dingley bill, thus far producing less than half the necessary expenses of the Government, and distinctly threatening a deficit of $50,000,000 instead of the desired sum "ample for pensions." But no such considerations will affect the claim-agents or a really enthusiastic Grand Army man. If there is not enough money in the Treasury, borrow it. If it was right to issue bonds to put down the rebellion, it cannot be wrong to issue them to still the clamor of the pension-agents.

Dingley deficits are producing an ominous silence in many quarters, nowhere more marked than in the *Tribune*. We all remember its eloquent and horrified accounts of Wilson deficits. With the deficit under the tariff that was going to "change all that," now amounting to more than $14,000,000 for August alone, why such delay in taking the floor to explain? The reason is that the *Tribune* was tongue-tied by an unfortunate admission of its own. When the Dingley bill was pending, it solemnly warned Republicans in Congress that the party could not "afford" to pass a bill which would result in deficient revenue "even for a time." But, alas, the party did it, even glories in it now, asks who cares a hang about deficits anyhow. It is only Wilson deficits that are really bad; Dingley deficits show how truly great and generous the Government is to pay out so much more money to the dear people than it receives from them. As the gifted Grand Army orator observed, under this Administration "the latch-strings are loosened," and almost anybody can get money out of the Treasury. This being so, anxiety about getting money into the Treasury is clearly unnecessary.

Prof. David Starr Jordan's report on the actual conditions of seal life in Bering Sea, and on the probable extinction of the herds if present methods are continued, is that of an acute observer, and therefore worthy of respect. But when he ventures into international law and the discussion of remedies, his opinions are to be taken only for what they are worth. He remarks that our Government made two capital mistakes. One was in asserting that Bering Sea was *mare clausum*. Inasmuch as all authorities and the arbitration tribunal were of the same opinion, it was scarcely necessary, though we admit it was magnanimous, in Prof. Jordan to declare it. Our other mistake was in leaving the regulation of sealing to a tribunal really incompetent to decide what was for "the welfare of the seals." Evidently man exists for the seals, not the seals for man. But Prof. Jordan adds, as a great novelty, that the thing now to do is to assert "property rights in seals on the part of the nations which possess the islands." He means, of course, property rights not merely when the seals are on the islands, but when they are swimming the trackless ocean. This claim, however, as Prof. Jordan appears not to know, was vigorously presented to the Paris tribunal, and was by that body put aside with something like amused contempt.

The mischief of crude and excessive legislation is a matter on which Governor Griggs of New Jersey is qualified to speak, and his address on "Law-making," delivered to the National Bar Association, contains perhaps the most thorough examination of the subject yet made. The complaint that legislators have no special training in law-making is as old as Plato's time, and we may as well assume that this complaint will always be made. The practical question is how to get better results out of such material as we have and are likely to have. The first step to be taken in finding an answer to this question is to define precisely the existing conditions, and this Gov. Griggs does very clearly. Every member of the Legislature, it would seem, feels it his duty to introduce a number of bills, and the whole field of human activity is thus made subject to annual regulation. Most of these bills fail of passage, but multitudes are adopted and become laws if the Governor approves them. Last year Gov. Black of New York disapproved five hundred bills which had passed both houses of the Legislature, and Gov. Griggs made a like dispositon of ninety. He doubts "if a single reasonable complaint of inconvenience or public loss has been heard by reason of the failure of these 590 bills to become laws." The public doubts if many such complaints would have been heard had the rest of the bills, with the exception of repealing statutes, met the same fate. By far the most of them are not of the nature of laws, but are devised to further special interests, and the remainder are largely the work of the "quack doctors of government."

The violent revolution in the system of assessments of property for taxation in Westchester County, N. Y., was immediately occasioned by Judge Keogh's directing the grand jury to indict the assessors for following established customs. One feature of this revolution was the assessment of property held by Justice Keogh, individually and as trustee, at very high figures. These figures are regarded by Justice Keogh as unjust, and he has employed counsel to obtain their reduction, apparently with success. His own personal assessment is much lowered, and that of an estate of which he is trustee is reduced from $900,000 to $125,000. As to this estate, it is said that the assessors did not pretend that their assessment was proper; they made it "to serve as a basis of settlement." We do not question the propriety of these reductions, but we fail to see how justice is attained by adopting a system which compels property-owners to employ lawyers in order to save their property from confiscation under the forms of law. Justice Keogh knows his legal rights, and can afford to employ counsel. His position insures respectful attention to his complaints. But many citizens are not so fortunate. Women will frequently submit to imposition rather than resort to legal remedies. Trustees are sometimes not alert, and not a few citizens are ignorant of their rights. It is not a satisfactory condition of affairs when men have to resort to litigation in order to enjoy their possessions in peace, and we doubt if any one will contend that the prosperity of Westchester County has been advanced by Justice Keogh's proceedings.

The fact of highest importance in connection with the retirement of Mr. Conlin from the head of the police force in this city, and the election of Mr. McCullagh in his place, is that the change destroys completely Commissioner Parker's power for evil. He is henceforth a nonentity in the department. Conlin was his tool, and the two working together were able to block almost entirely the efforts of the reputable members of the Board to put the force on a new and thoroughly efficient basis. They stood in the way of all desirable promotions, because Parker wished to have no promotions made save those which suited his purposes. Conlin's departure leaves Parker powerless, and permits the Board to accomplish during the remaining four months of its existence the work of reconstruction and reformation which Messrs. Roosevelt and Andrews planned in the early months of their service. With the cordial cooperation of Messrs. Moss and Smith, Mr. Andrews will be able to see his long and intelligent labors crowned with success. He will be able to leave the force in a thoroughly reconstructed and well-disciplined condition, and will thus place the department at the close of the Strong administration in the position which it would have taken at the beginning had it not been for the sad mistake of Parker's appointment. The patient firmness and simple, unostentatious devotion to duty of Mr. Andrews have won the day in a prolonged contest with one of the wiliest politicians of his time.

The movement in favor of free trade started in Canada under the leadership of Sir Wilfred Laurier seems likely to have far greater consequences than were

anticipated. In the first place, it put an end to the protectionist dreams of an imperial customs union, under which England should impose duties on the products of all other countries except her own colonies, while her colonies should continue their protective systems. Mr. Reid, the Premier of New South Wales, supported Sir Wilfred Laurier in the positive declaration that the idea of such a union was altogether inadmissible. In the second place, the Canadian Government, finding it impossible to grant reduced duties to England without bringing into play the treaty rights of other countries, has boldly extended these reductions to all countries that have any reasonable claims to them. In the case of Germany and Belgium the period during which the reductions are to be enjoyed is limited by the denunciation of the existing treaties, and the effect of this denunciation has been quite different from what was expected. Apprehensions were expressed that retaliatory measures would be adopted; but nothing appears to be further from the thoughts of the Germans and the Belgians. On the contrary, they seem to have considered the prompt denunciation of the treaties as a sign that England was prepared to adopt retaliatory measures herself, and to have been alarmed at the possibility. They are well aware of the enormous value of the English market, and they have no disposition to adopt a course that might cause them to lose it. The indications are that the temporary advantage gained accidentally in the Canadian market may induce more than one foreign Power to negotiate for permanent tariff reductions.

The British Government is encountering some difficulties in the attempt to conduct public business according to the demands of the labor-unions. Under the influence of the very old fallacy that wages can be raised by act of Parliament, that body was induced in 1891 to pass a "fair-wages resolution" to the effect that in all Government contracts provision should be made for paying such wages "as are generally accepted as current in each trade for competent workmen." But it is true in England, as it is in every other state, that in no trade is there a rate of wages current throughout the country. There are different rates of wages for the same work, each current in a particular region, for the very good reason that the expenses of living and the cost of production are extremely variable factors. The same money wages in this country would have very different purchasing power in different sections, the result being that cost of production is equalized by not paying the same money wages everywhere. The same phenomenon exists in England, the wages of ship-builders in London being higher than those which prevail in the northern counties. Hence, the Admiralty construed the parliamentary resolution to mean, not the rate of wages current everywhere in a trade, for there is no such rate, but the rate prevalent in the particular district where the contractor carried on his operations.

This construction suited neither the labor-unions nor the London ship-builders. What the labor-unions wanted was that the highest rate of wages anywhere paid should be taken as the rate current in each trade. The London ship-builders contended that the Government ought to make them an allowance on account of the higher wages which they were obliged to pay, just as our protectionists insist that Congress shall arrange the tariff so as to compensate American manufacturers for the high price of American labor. One of these ship-builders boldly demanded that the Government should give a bonus of £20,000 for every battle-ship built on the Thames, alleging that workmen could not be obtained for less than the rate now current, which made it impossible for London shipyards to compete with those of the north. Another admitted that men could be obtained for lower wages, but claimed that it was the obvious purpose of Parliament to keep wages up and not compel contractors to drive hard bargains with their laborers. He ingenuously maintained that as London paid nearly one-seventh of the national taxes, its workmen should receive their share of the national contracts, "and not be permanently estopped and handicapped from their legitimate occupation because the rates of wages in London are, and have been for many years, for good reasons, higher than those of the provincial outports." It must be said that this argument is not inconsistent with the theory of the fair-wages resolution, but the Parliamentary committee investigating the subject do not yield to it. On the other hand, they point out that the effect of the resolution is to exclude old soldiers and sailors from employment by Government contractors. The contractors say that they would be glad to give these men work, but that they cannot afford to pay them the wages of "competent" workmen, because they cannot earn such wages. The only result of this well-meant resolution seems, therefore, to have been to drive the old soldiers and sailors out of employment on public works—a result to which the labor-unions appear to be reconciled, but which is on almost every account deplorable.

President Krüger's flat denial that England has suzerain rights over the Transvaal is evidently intended as a challenge to Mr. Chamberlain. That gentleman remarked rather tartly in the House of Commons the other day, when asked why England did not arbitrate her differences with the Transvaal, that no suzerain nation ever arbitrated disputes with a vassal country. Krüger now replies that the recognition of British suzerainty is not made, in precise terms, in the convention of 1884, though it had been in the superseded convention of 1881. He has to admit, of course, that the 1884 agreement restrains the Transvaal from concluding "a treaty or engagement with any state or nation other than the Orange Free State, or with any native tribe to the eastward or westward of the republic, until the same has been approved by her Majesty the Queen." This provision he means to live up to loyally, but it is not suzerainty. Chamberlain declares it is. So the dispute is only a verbal one, after all. Chamberlain says to Krüger, "You have got to live up to your agreements with me, your suzerain." Krüger replies, "I am going to live up to my agreements with you, confound you, but you are no suzerain at all." Still, disputes about words are often the bitterest and most dangerous of all, between men or nations. There is no doubt that Chamberlain will be made "very angry" by Krüger's defiance, as Flora Shaw said he was by one of Rhodes's impudent telegrams.

A curious piece of evidence bearing on the success of the English rule in India is furnished by the popularity of the courts established in that country and especially in Bengal. Litigation increases beyond the power of the existing force of judges to deal with it. Under the *pax Britannica*, disputes can no longer be settled by the sword, and murders and raids and family vendettas are things largely of the past. But the natives have learned that they can carry on their quarrels through litigation, and the agricultural classes are especially pertinacious in asserting their legal rights over land and irrigation privileges. The peasants not only resort to the courts, but they are not satisfied with the decisions of the tribunals of first instance. The number of appeals has increased until it is now about 30 per cent. of the contested cases. There seems to be no way of stopping the initiation of legislation, which is evidently the outcome of the national character, but the Government finds it necessary to decrease the volume of appeals in petty cases in order that the higher courts may be able to give proper attention to really important matters. To allow such appeals, when the lower courts are of good character, tends more to the oppression of poor suitors by rich ones than to secure the rights of the feeble, and reforms are now proposed which shall effect a prompter administration of justice.

SURREPTITIOUS LEGISLATION.

Mr. Bagehot won much fame by pointing out that the British Constitution in its actual working was a very different thing from what it was described to be in the books. We need not look far to find evidence that a similar opportunity of obtaining distinction awaits some American observer. The fields are white for the harvest, and a plain account of how laws are not made and Senators not chosen by the Legislature, but by mysterious individuals and unknown bodies, would fill an interesting volume. But we must add the caution that the American observer will find it necessary to be very expeditious in publishing his results. We are a pushing people, and our political development is going on at a pace that may well make the panting philosopher toil after it in vain.

The discovery that discriminating duties of the most revolutionary character had been introduced into the tariff without the knowledge of the framers of that instrument, ought to open the eyes of the country to the dangers of continuing to legislate after our present manner. We have come to regard our legislatures as bodies that do not originate laws, but, like the Roman Senate in the time of the empire, merely register the edicts of the sovereign, or, as we call him, the Boss. We now see that these sovereigns of ours are not satisfactory legislative bodies. They have too many other things to look out for to be able to attend to the details of legislation. Meanwhile, the Legislature having abdicated as a deliberating body, the door is open for all sorts of laws, pushed by all sorts of influences, to slip into the statute books.

We have seen the results in the case of Congress, but we can find them in abundance in the legislation of the State of New York. Not very long since a vigorous attempt was made to adopt the code prepared by the late David Dudley Field. The legal profession was aroused and the project was defeated. But it now appears that the law has been to a considerable extent quietly codified without any pretence of discussion or of consulting the profession. It may be conceded at once that the law is susceptible of improvement, and that a body of learned jurists with Mr. Field's qualifications might restate it in a more convenient form. But the matter has been undertaken by a commission in the selection of whose members the legal profession had no part. Speaking moderately, we may say that this statutory revision commission has not been composed of very eminent jurists. It was originally a product of Gov. Hill's administration, and Gov. Hill did not dispose of offices without regard to personal or party considerations. The names of the members of this commission were and are unknown to the public, and even to many members of the legal profession. Had they confined themselves to their proper work, the orderly arrangement and classification of the statutes, they might have attained honorable distinction. But the temptation to state the law, not as it is, but as they think it ought to be, has proved irresistible, and as our legislators are, of course, too much absorbed in "politics" to be able to scrutinize the great volumes of revised statutes laid before them, the people find themselves suddenly living under a body of general laws not only formulated in new language, but also containing new principles.

Occasionally the propensity of this commission to make such laws as it saw fit has been rebuked. It got up some laws concerning corporations that were so outrageous as to compel their precipitate repeal by the Legislature, and its revisions have been already extensively revised. But many of its changes are not of a description to arouse public attention, and yet they may be of a revolutionary character and affect vast interests. It was provided in the Revised Statutes, after careful deliberation on the part of the great lawyers who had charge of the work, that any conveyance of real estate by a trustee in contravention of his trust should be void. The purpose of this provision is obvious. Men wish to protect their children and dependent relatives against want. They know that trustees may prove dishonest or incapable; that they may make bad investments, or convert personal property to their own use. But under this statute all danger from these causes could be averted, and numberless estates have been safely kept until the assigned period for their distribution.

For fifty years this law stood unchanged. Then the Legislature, perhaps for good reasons, authorized trustees to raise money by mortgage when the court was satisfied that such a course was necessary for the preservation or improvement of their estates. Soon after, the sale of such estates was authorized upon like conditions. The courts, however, were extremely cautious in the exercise of the power conferred upon them, and unless it was clearly made out that a case of necessity existed they refused all applications. Such conservatism did not please the Revision Commission, and, without warning to the public, they changed the law so as to make it necessary for a trustee only to make out a case showing that it was "for the best interest" of his trust estate that it should be sold in order to convert it into cash. It is easy to see what this might lead to. With the proper affidavits, the right kind of judge, and a lawyer with a "pull," it would not be hard for a trustee to prove a sale of real estate beneficial when there was no one interested to prove the contrary. We do not now question the policy of this legislation. It may be that the creators of trust estates, employing as they generally do the wisest of counsel, are less fitted to decide whether they will have their lands convertible into money than their trustees and beneficiaries. They can create and limit powers of sale if they choose; and if they think it wiser not to do so, some will hold that they ought not to be interfered with. Be this as it may, it hardly admits of question that changes of this momentous nature, affecting the interests of classes peculiarly unable to care for themselves, should be made only after the most prolonged and thorough discussion. We are glad to see that this measure was amended by the last Legislature in some important respects.

This change was of a piece with the treatment of the law of real property by this commission. For over sixty years the Revised Statutes have contained the law on this subject substantially unmodified. Every doubtful point, every ambiguous word, in this body of law has been the subject of litigation and judicial interpretation. The language employed by the revisers may not have been altogether happy, but it had come to have an understood meaning. Like the errors in the authorized translation of the Bible, the dubious phrases of the Revised Statutes had become innocuous, and the result of the labors of the eminent scholars who lately undertook the retranslation of the Scriptures might have served as a warning to those who would overcome established usage.

But there is this difference between the cases. Those who prefer the old version of the Scriptures can continue to use it. Its familiar phrases and their accepted meaning can be cherished by those in whose memory they have become imbedded. But the unfortunate lawyer who knew by heart the precise language expressing all the main principles of our law of real property now finds this knowledge a delusion and a snare. The quicker he can forget it all and begin with the beginners in the profession, the better for him. He must go over the whole field, page by page, section by section, sentence by sentence, even word by word, for the slipping in of an "or" for an "and" may involve a matter of millions. This enormous burden appears to have been imposed in utter wantonness; it is an arbitrary and unprincipled exercise of irresponsible power. No lawyer worthy of his profession would ever consent to change the wording of a thoroughly construed organic statute if it could possibly be avoided; no matter with what skill the change is made, it always involves the substitution of a possibly doubtful meaning for one that is known. But the New York commission has gone through the law apparently on the principle of changing for the sake of change. Whole

pages may be cited where the wording of nearly every sentence has been altered, while it is quite likely that the commissioners would declare that they had no intention of modifying the meaning in the slightest degree. The mischief is done, and of course there is no help for it; but in the name of the orderly administration of the fundamental laws of property we can at least protest.

THE DOWNFALL OF A BOSS.

Senator Wellington is no longer the boss of the Republican party in Maryland. The party has until recently had little need of a boss in that State, which is normally Democratic, and its politicians are comparatively independent. Like the barons of feudal times, they are not disposed to concede absolute power to any superior potentate, and history shows that such power is established only gradually and by slow degrees. The barons apparently maintain their claims, but from time to time an able and ambitious king comes to the throne, and by politic measures enlarges the royal prerogative and transforms nominal fealty into actual submission. This change, as we have said, seems to have usually taken place imperceptibly, and the sovereign who has brought it about has been careful not to arouse opposition by openly proclaiming his purpose. Successful despots have in all ages found it wise to leave the semblance of free institutions to peoples whom they have enslaved, and our most successful political bosses have adopted this policy. Senator Wellington has been overthrown because he rejected it. His dynasty had not been consolidated by time or confirmed by success; nevertheless he acted as if his will was law, and, like many other weak rulers, found it was not.

We cannot say what the result of Senator Wellington's action might have been if he had not undertaken to lay down the principles of boss rule. It is reported that his followers in Baltimore conducted the primary conventions for the nomination of a mayor so unfairly that a majority of the Republican voters withdrew and held primaries by themselves. The candidate nominated by them thus represented majority rule, while the candidate nominated by Senator Wellington's adherents represented "regularity." Under such circumstances much adroitness and diplomacy was plainly necessary if the endorsement of the State convention was to be procured for the regular nominee. The spirit of rebellion and mutiny being aroused, conciliatory language should have been used, and, possibly, some concessions granted. Instead of pursuing this policy, Senator Wellington resorted to an arrogant assertion of irresponsible power, and, in effect, defiantly exclaimed, like Boss Tweed, "What are you going to do about it?"

In his opening address to the convention he used this language: "I claim that it is not only my right, but my duty, occupying the position I do, to exert what influence I have toward the end that fit nominations be made and suitable principles enunciated for the guidance of the Republican party. . . . I have never assumed authority that was not of right the prerogative of the position I hold. Custom has given certain consideration to Senators of the United States. These privileges I shall claim as my right so long as they are granted to others, and there shall be no infringement without my indignant protest." The Senator continued in this strain, openly declaring that he proposed to control appointments to office in Maryland, and that he should give them to his political supporters.

There can be no question that this is a correct account of the principles of boss-rule, although for a boss to state these principles openly is a violation of the highest principle of all, that of secrecy. However this may be, the public is to be congratulated on having the nature of what we call government by the people authoritatively explained to it. It may as well discard text-books of politics used in the schools and adopt Senator Wellington's statement of principles as containing the true explanation of the practical administration of our government. The Senators of every State—not the President of the United States, as laid down in the Constitution—constitute the appointing power. Our constitutional law may be summed up in this statement, and our party law is concisely formulated in the proposition that Senators are to enunciate the principles of the party, to select its nominees, and to give the offices to their political friends.

Some may be disposed to protest that the enunciation of principles has never been recognized as one of the prerogatives of a party boss, and it must be admitted that it is not easy, even with Senator Wellington's aid, to prove the existence of doctrines heretofore esoteric. But the objection is not important, because, when compared with offices, party principles are not important. However it may be with outsiders, active politicians care much more about candidates than about platforms. Platforms consist of abstractions and generalities; candidates stand for the concrete benefits of salaries and fees and contracts. Of course, the enunciation of principles is occasionally very important in attracting independent voters to the support of a particular party, and it may thus require the attention of the boss as affecting the permanency of his power. Beyond this, the enunciation of principles is a matter of indifference to him, and he would probably be willing to have them dispensed with altogether. Indeed, Senator Wellington's case is an illustration of the danger to a boss that lurks in the profession of principles. Had he held his tongue about the principles of boss-rule, and not openly told the Republican politicians that they were his subjects, they might have continued to obey him. But the traditions of freedom are so recent in this country that even politicians resent the public advertisement of their subserviency, and the wise boss must be contented with the practical fidelity of his followers, without compelling them to do him open homage.

"THEORIES" OF PUBLIC EXTRAVAGANCE.

The official volume of "appropriations, new offices, etc.," for the fiscal year of 1897-'98 has been compiled by the clerks of the House and Senate committees on appropriations, and an abstract of its summaries has been given to the press. Its main features are the following:

General appropriation acts	$397,100,384
Deficiency acts	10,557,417
Miscellaneous acts	999,057
Total	$408,656,858
Permanent annual appropriations	120,078,221
Making a total of appropriations of	$528,735,078

"The number of new offices and employments specifically authorized is 410, at an annual compensation of $443,439, and the number omitted 134, at an annual compensation of $157,697, making a net increase of 276 in number and $285,742 in amount. The number of salaries increased is twenty, at an annual cost of $6,814, and the number reduced two, at an annual cost of $400. The total amount of contracts authorized requiring future appropriations by Congress is $2,269,375."

When Chairman Cannon, at the close of the regular session, made the customary statement of appropriations, he put the total at $518,103,458. The discrepancy of $10,000,000 is partly accounted for by miscellaneous appropriations made by the extra session. The rest is amply explained by the hocus-pocus and understatement in which all chairmen of appropriations committees indulge, in order to avoid an appearance of extravagance. But if appropriations of $518,000,000 were, as Mr. Cannon confessed they were, "in excess of the legitimate demands of the public service," we can be in no doubt what adjective to apply to appropriations of $528,000,000. They are grossly extravagant. In view of the embarrassed condition of the Treasury, they are recklessly, almost criminally, extravagant. This is an old story now, but the swelling deficiencies of revenue under the Dingley bill make of it a story which we shall have to hear a great many times over, wearisome as it may become.

How to account for the great increase in public expenditures, especially for such deliberate extravagance as our Congress has been guilty of in recent years, is a puzzle to many public men. The guiltiest Congressmen themselves cannot understand it, they say. Some mysterious power gets hold of them and

makes them lavish of the public funds in spite of the most frugal and virtuous intentions. Economists have studied the phenomenon, and have got up grave theories to account for it. Some of these are referred to in the article on the subject in the *Yale Review* by the Italian writer, Signor Giuseppe Fiamingo. Thus there is the explanation of Jevons and others that increased expenditures result from centralizing the powers of the state, and that this centralization arises from the economy of public works compared with private undertakings. This theory makes extravagance identical with real utility. Of course, the state ought to do its work more economically than an individual, just as a great corporation can reduce its cost of production as compared with a small firm. But does it? The inquiry as to the actual fact at once destroys the fancied utilitarian basis of increasing public expenditures. Such works are notoriously and demonstrably wasteful.

Another theory is that progressive appropriations of public money arise from extending the functions of government. The state is growing more conscious of itself and of its paternal duties. It benevolently undertakes to care for one new class after another of its hitherto neglected children. What all this really amounts to is only a statement of the problem in another form—the thing really requiring explanation is precisely why all these new fields for public outlay have been found and have been made such a drain on national resources. Were not Congresses conscious of being "paternal" before they began voting money in excess of the legitimate demands of the public service? A father is sometimes most paternal in severely cutting off the pocket-money of prodigal children. Paternalism, in this new view of the word, is only another name for spendthrift squandering.

All these shifts to avoid facing the acknowledgment of a decaying parliamentary government and of inexcusable extravagance in public expenditure, Signor Fiamingo dismisses as "pure illusion." These economic abstractions have no counterpart in reality. There is no such thing as a "state," anxiously asking when a new function is proposed to it, "Would it be more advantageous to leave this function to free individual activity, or would the greatest advantage be derived from making it a public service?" The state, in the case supposed, is nothing more nor less than a group of scrambling politicians, eager to obtain and retain power, and perfectly aware that the best way to do it is to secure for themselves and their districts the greatest possible amount of public money on whatever pretext occurs to them. The real place to look for the increasing extravagance of parliaments and congresses is, as Signor Fiamingo truly says, in their "make-up and methods." One glimpse of the real appropriator at work is more illuminating than all the economic theories that can be devised to account for his lavish appropriations.

The average Congressman or member of the Legislature, with his average political career, furnishes a "theory" in his own person which beats the economists out of sight. Extravagance, he can say like Louis XIV., *c'est moi*. At every step in his political advancement, from Alderman to Representative, he has learned that the surest way of getting on is to get every cent possible out of the public treasury for his ward or district. The most certain way to beat a rival for the nomination is to promise to get more public money than he dares to. Every appropriation secured, every public building obtained, or river-and-harbor job put through, means renomination or promotion. This is what is meant by the increasing "pressure from the constituencies" over which Speaker Reed and Chairmen Cannon and Allison are so much disturbed. The real pressure is from candidates for office, who want to get delegates and nominations by means of grants from the Treasury. This is a sufficient working hypothesis to account for nine-tenths of the extravagance in our public expenditures. Economic reasoners need not lose themselves in their own inner consciousness to find an explanation of the mystery. Let them open their eyes and gaze upon the average Congressman, and all will be clear.

THE DECAY OF TOWN GOVERNMENT.

Prof. Norton's speech at the Ashfield dinner on the village hoodlum has attracted wide attention throughout New England; its delivery is really an important event. We have been accustomed for two generations to hear the government of New England towns—that is, town government in the most civilized part of the country—extolled as very nearly perfect. These towns were formerly taken by writers on government to represent democracy and equality in their best form; in fact, the New England town has been steadily pointed to as having proved the case of democracy, because it showed that a pure democracy, made up of farm-owners, nearly equal in station, could produce a state of society and government in which there was little or no crime, hardly any poverty, low taxes, complete safety for life and property, and general contentment. This was at one time a true picture, and that it should have been attributed directly to the town-meeting is not surprising when we reflect that the town was the fundamental political institution, and did provide pretty much all the governmental machinery with which most people came in contact. It was as purely a democratic institution as the representative system has ever produced, for all the town officers, from selectmen to constables, were elected once a year by the votes of the entire community. Down to within twenty-five years, to question the excellence of New England town government would have seemed like questioning democracy itself, and the consequence was that any criticism of or inquiry into the actual condition of these towns and the government they provided was resented as a sort of impertinence. The proper attitude of mind was felt to be that of wonder that such a perfect thing should have been produced by man.

To say that this picture is no longer recognized as true would be a poor description of the change which has taken place. In these same town governments the very same system is found to produce to-day the very opposite results. There is plenty of crime and poverty, tramps infesting a community in which the word itself was once unknown, and village hoodlums, every one of them a potential criminal, preparing themselves for rape and murder by vagabond drinking; the taxes are unequal, and often the cause of great complaint; life and property are most insufficiently protected, and a state of great general dissatisfaction is reflected every day in the local press, and brought deliberately to the attention of the public at large by representative men.

Although the proof is not easy to get, it is generally believed that this state of affairs is closely connected with public corruption—not actual stealing, but that sort of petty pilfering or jobbery which prevails when the desire to peculate is tempered by the knowledge that the fund on which inroads can be made is not very large. It must be remembered, however, that the growing wealth of New England is continually bringing within the reach of the Village Tweed new money, especially in the thinly settled wilder portions of the country, filling up with millionaires and magnates from the city, who add to the taxable wealth of fine houses, stock farms, and other improvements, and who expect to be plundered a little. They sometimes provide a sort of police on their estates in their men-servants, but they take no more part in the government of the town than they do in that of Switzerland. They will all willingly admit, however, that there is apt to be a little "ring" in the town, and that the selectmen are suspected of profiting by contracts let by themselves.

When we ask what is to be done about all this, the answer is not simple, and, no doubt, the evil will only be slowly remedied. That it will be remedied we have no question, for the same reason that we have always believed that municipal government would be purified—because the evil is intolerable, and increasingly so. Plunder and misrule and

disorder and danger can no more prevail in the country than they can in town, unless civilization in the United States is to be extinguished.

The cure must come from the action of those who suffer from the disease, and it must come also through a recognition of the fact that a system of government which would do for such a community as New England was fifty years ago will not do for the same community as it is to-day, with its absentee wealth and its deteriorated suffrage. The "ring" in the village rests upon the same basis as it does in the city—a little rural machine of a few dozen voters who are supported by labor furnished by the town, and in return go to the town-meeting and keep in office the selectmen who furnish them support. They are a mere handful, generally outnumbered by the property-owners, who, however, stay at home and let them do it. These property-owners have the matter in their hands, and the misrule which exists is the measure of their indifference.

For good responsible government in a modern rural community an annual election of every single town officer by all the adult males would commend itself to few who have given any attention to the subject. They would say that for such a purpose the "head men" must have a decently long term of office, and that an elective constabulary is a farcical institution. But these difficulties can be overcome. In Massachusetts, for instance, the statutes already provide that towns may prescribe for their selectmen and assessors a three years' term, and within four years the same State has enabled them to set up a paid and armed police. In the town of Southampton, where a paid policeman was recently removed for enforcing the law, the trouble was not with the law, but with the selectmen, and if their action is ratified by their continuance in office, there is no redress. Behind the local community itself no one can go, unless affairs get so bad that the State should be called in to police the towns, in which case we have not the slightest doubt that it would be called in, for protection to life and property our race will have in some way.

The corruption in these governments can be broken up only in the same way as elsewhere—by resisting it, attacking it, and making those guilty of it pay the penalty. One of the largest property-owners and taxpayers in Lenox is reported to have brought a taxpayer's suit against one of the selectmen of that town, and if the matter has been correctly reported in the newspapers, the suit grows out of the practice of illegal giving by officials of contracts to themselves—a practice which produces corruption and waste as inevitably in Lenox as it does in New York, in a town as it does in a bank. Such a suit sounds the doom of the practice against which it is directed, and what is wanted is more such suits. We hear a great deal nowadays about "civic spirit," which is, no doubt, a good thing, but it is not worth a postage-stamp unless it is based on private spirit and honest indignation at wrong and oppression. There is plenty of machinery in these towns to make their government what it ought to be. What is wanted is action.

A BICYCLE-RIDER IN EUROPE.

GENEVA, August 20, 1897.

I had got myself made a member of the Touring Club of France just before leaving home, and at Havre I was met by the badge of the club and by a plaque of identification to fasten upon the machine. These articles, enamelled in colors, are very pretty, and were rather the admiration of the ship. Plenty of other bicycles were hoisted out of the hold, but it happened that I was the only passenger who was to begin to wheel at once. As a member of the club you do not have to pay any duties on your machine. Two customs officers scrutinized my card of membership closely, the second coming to look at it after the first had finished; he explained apologetically that these cards were sometimes presented nearly in blank. They require to have your photograph in a corner, and to be filled up with the name of the Mayor of your town and various other particulars. They expect our Mayor to be a useful person and mix himself up with all the affairs of life, as he does in a French community. Advice to those hereafter who may be inclined to leave the card in the virgin state in which it comes from the American delegate, Col. Hesseltine of Boston.

The Havre steamer arrives Sunday afternoon, and it was the season of the Pentecost fêtes besides, but I found a *mécanicien*, in the Cours de la République, who went to work in a business-like way to deliver the bicycle from the light wooden crate and the thick smearing of vaseline under protection of which it had crossed the ocean. Interested bystanders pronounced some parts of the machine, as they saw it develop, *chouette* (smart and taking), and others *rigolo* (funny or queer). A very common remark heard about the American wheels, as about many other American products, at present, is that they have *du cachet* (good style, distinction). The description is gratifying, of course; can it be that the tables are really turned? For this is precisely the quality we have always been attributing to things French. I began to notice at once, in fact, as I looked about me at the machines the dealer had in stock, while waiting for my own, that the foreign make of bicycles have a heavier, clumsier cut. Later experience soon led me to see, however, that much is to be said in favor of their greater solidity, as adapted to their peculiar conditions.

I left the dealer five francs and my crate, and started out into the open country. The foreign soil received hospitably the visitant from the other side of the world that rolled with light impact on its surface; even the cobble-paved streets were smooth, and the trolley tracks were sunk flush with the surface. Ten or fifteen miles on a little tour of exploration, and to see that all was working perfectly—it was nothing at all; and what a surprise, what a pleasure, to thread in this easy way even the characteristic crooked alleys of the French villages which I had so often laboriously trod on foot. The next day along the coast for Trouville. Private and local fêtes were on at Honfleur, and it was almost impossible to get aboard the boat crossing the mouth of the Seine to that point. The spirit of the crowd was not at all favorable to the bicycle—"*vélo*," they call it, contraction of velocipede, and the word in popular use—and it received more than one vicious push and even a wrenching at the spokes. Above Vasouy I made my first acquaintance with one of the characteristic French hills. You are confronted with the notice, put up by the benevolent Touring Club: "Cyclists, attention! Rapid descent and dangerous turning." The road on these hills is as winding as the usual French road is mathematically, remorselessly straight; the surface is perfectly hard and even, and you get no assistance in holding back from the friction of any rough places. Suppose, in going down at a fast pace, you come—a very common incident—upon a string-team of draught-horses all spread out over the route, it is not so easy to get out of the scrape.

I had come over without a brake, and was riding, too, a seventy-six gear. I had been told that a brake was not obligatory here, and, indeed, it is not—you are quite at liberty to break your neck if you wish; but the question is, whether you wish. All around Paris, all over France, there are such hills, to say nothing yet of the mountains proper. Lesson number one, then, the very great, really the vital importance of having a brake.

I have journeyed alone usually; the only examples of "tramps" I recollect encountering were a couple I met at the mouth of a sequestered lane, just before Pennedepie Church. They were a sturdy pair, representing *Robert Macaire* and his aid *Jacques Strop* to the life. Macaire had a green patch over one eye and Strop had a crutch. They advanced, one before the other, and began to ask assistance for two unfortunate laborers out of work—mendicancy being forbidden, too, in the French communes. I trust I did not do injustice to two very worthy persons, but I sped on without attending at all to this petition.

Returning to Honfleur, I started for Paris by way of Rouen. Up to this time everything was working smoothly. A good many small flint-stones crackled under my wheels, but I was agreeably reassured; they seemed about as harmless as the cinders or gravel on one of our bicycle-paths. I had the wind with me, and was making great progress. The roads are good and even from side to side, and you do not have to fix your attention too exclusively on your way, but can look about you at the architecture and the landscape. I had made, say, fifty miles in all, when, at but five o'clock in the afternoon, at Pont-Audemer, with three good hours of daylight before me, I found a big nail, from a peasant's shoe, sticking in my main tire, and the tire was leaking from a score of small places besides. Impossible to find anybody in the town who could mend a single-tube tire; they understand nothing but the Dunlop or some French modification of it. The incident gave me an opportunity to make the acquaintance of the local delegate of the Touring Club. He was very polite. He told me about the temper of the

people towards the bicycle, which is improving, now that the postman, the *huissier*, and others begin to use it practically in the way of their work. He found me a jeweller, an ingenious person, who in general could mend anything, and between us we managed to heal the wound caused by the hob-nail from the shoe. But even then the condition of the tire was hopeless. I had to take the train for Paris and purchase a new one. Cost of that day's damages, exclusive of hotel bill, railway fare, and expressage on trunk, already sent on, say, 40 francs. I am bringing back the collapsed tire; whether it was originally defective or whether it was cut to pieces by the flints in the road has not yet been determined. The flints are precisely those used in the firelocks of our forefathers; they have the sharp cutting edges of broken glass or crockery, and the roads of much of France, including Paris, are mended with this pleasant material. Certainly outfitters at home who will let their clients come over with apparatus in a defective condition to this large Europe, where it proves to be so extremely difficult to get parts replaced or repairs made according to our own system, are very conscienceless. On the other hand, as many of them have not travelled abroad, it must be hard for them to realize how very different the state of things in Europe is. With all the talk about American machines abroad, and although you find many of them in the windows of the bicycle-shops that occupy almost the whole length of the Avenue de la Grande Armée, in Paris, up to the entrance to the Bois de Boulogne, the workmen and the salesmen are all French, or English at most, and you get no good, hearty American aid and comfort. The feeling is often that you are being *exploité* (imposed upon) in these establishments, as in many others.

The next accident that happened to me was to break a pedal-pin out at Ville d'Avray. Return by the train and a hunt all over Paris, which resulted, not in replacing simply the broken pin, but in having to buy a new pair of pedals. And again it was a lucky chance to find pedals of the same make, though well known at home; one dealer happened to have just a single pair, which had been sent over to him as a specimen. Later on, in the Riviera, there broke an end of the main axle, the crank-hanger. That was clearly a defect in the machine. There was an agent for the make I ride in London, but not nearer. I could hardly wait, two or three weeks, to get a new axle from him, so I had one forged at Nice; price 12 francs, and two days' delay in my plans. The "clumsiness" of foreign bicycles now began to take on a very different aspect. The tourists I first began to notice, on the northern coast, had thick, substantial, double-tube tires, often corrugated so as not to slip, stout, wide cranks, saddles with heavy springs, substantial brakes, liberal mud-guards, and often gear-cases. They were not pretty to look at, if you will, but they went rolling on through rain and shine. Our own manufacturers would do well to have less *cachet* and a good deal more conscience, or at least more good judgment as to the strength of materials.

I have had many other things to do, and have by no means been travelling on, but only *with*, a bicycle. The modest figure of 700 miles that my cyclometer now registers includes much rolling around the streets of Paris and its environs; through the sequestered shades of the forest of Fontainebleau; Grenoble and its charming adjacent regions; over the pass southward to Nice; from Nice to Menton by the lower road and back by the upper; and now, latest, the charming run around Lake Leman. Chamonix and other Swiss excursions are still in prospect. In addition, I have constantly used the bicycle in practical fashion in the towns where I have stopped, so that there is to its credit in the expense account some saving in cab-fares. It has knocked about a good deal by railway, without being crated (for who could bother taking a clumsy crate with him in such journeying?), but thus far it has met with no serious damage. This is a wonder to me, too; for, although it may be a simple enough matter for the man in the baggage-car to give your bicycle a good, safe place in the beginning, he has to put off and take in a lot of baggage at each new station, and he must have to push it about and rearrange it a great deal. Owing to various conditions I have indicated, I am not at all certain that it would not be better for those to whom expense is an object to hire bicycles on this side of the ocean, instead of bringing over their own. The prices, as I have demanded them, vary from 80 or 100 francs a month on the Avenue de la Grande Armée to 50 francs or less in a more modest part of Paris, and to 40 or possibly less in smaller cities like Grenoble and Geneva. "But you would not get a good one," somebody interposes with vigor. "Softly there," I am inclined to reply; "all bicycles are good; the only difference is that some are better than others." I have come to have plenty of respect for the foreign bicycles; they get over the ground at as great a pace as our own; they are comfortable, and they are safe.

The wheeling excursion I took that offered the best occasion for character-study and human interest was a *Rallie-Papier*, or paper-chase, a run on the principle of fox and hounds, with the Touring Club of France, in the forest of Saint-Germain. The course was fifteen miles, a hard one, too, with many stiff hills in it, and then there was fifteen or twenty miles more to Neauphle-le-Château, where a gay breakfast was taken in the open air. There were more than 200 riders, a considerable number of them women. In the forest many false leads were given, and it was entertaining to see eager groups going and coming swiftly on all four branches of a cross-roads at once. After breakfast there were some amusing games, joisting at rings with canes or umbrellas for lances, and the like. All passed off with great humor, and many of the pet terms invented for the bicycle were heard. The tire is a *pneu* (pneumatic, the "*p*" strongly pronounced); the smart name for the machine itself is a *bécane*, which means something like "nag" or "hobby-horse." If you get a tumble, you *ramasser une pelle*—that is, you "pick up a shovel." The women invariably wear knickerbockers, and, when dismounted, they go about with their hands in their pockets, in a good-fellow sort of way. The costume is not bad on the wheel, but on foot it is rather waddling. The men have some extraordinary jerseys, but in addition to that they adopt, almost like a uniform, trousers and cap of black and white check and black stockings. If they mean to be very elegant, they add white gloves. All mount much lower than we do, so that when the start was given, the contestants were simply bestriding their machines with one foot on the ground. If toe-clips (*fixe-pieds*) are used, they just clear the surface.

What I may call my most dramatic and moving excursion was the dragging a fagot, or clog, down the abrupt mountain descent on the journey to the Grande Chartreuse. I had always wanted to try dragging the fagot. I started with an agreeable companion, Prof. Santis of Grenoble. We took the diligence at 5 o'clock in the morning, and, after five hours' climb, alighted on the Col de Porte, the pass about 4,500 feet high. Thence there is a run of about eight or ten miles down to the Hôtel du Désert, from which point you climb again to the Chartreuse. My companion was a practical mountain-rider, but he, too, had only heard of going down steep inclines with the aid of a clog, and had never personally tried it. As he was a professor of physics, he was just the one, I claimed, to make a careful computation of our weights and all the other conditions, and so adjust the clogs we needed with entire accuracy. We dispensed, however, with these elaborate preparations. A cantonnier, or road-mender, fitted us out with two large dried branches—we tied them on behind the bicycles, and started. The grade is extremely stiff, part of the way as much as ten per cent.; it seemed to me a good deal like going down stairs. The professor of physics was soon gayly lost to sight in front. I essayed to go on more slowly, but my machine carried much more avoirdupois than his, and I was soon aware that I was being run away with, in spite of my dragging pine-branch. In the meantime, I may explain, I had had a brake put on my machine, a light graceful one, acting on the rear wheel. It had the disadvantage that you had to let go one hand to get hold of it, and besides it was not effectual in a pinch like the present. Such mountain roads are built only by a system of sharp zigzags, and if you cannot slack up at one of these sharp turns, you are in danger of going over and landing on the roof of a chalet in the valley, half a mile below, to the astonishment, no doubt, of the inmates. However, I had only the bare intimation of such a romantic fate and escaped the reality; I got off free from harm, within a few feet of the verge. I rejoined my sanguine professor of physics—he added the weight of his pine-branch to mine, got another for himself, and again we started. But the cords with which our clogs were fastened on were only small twine; I could not help being a little nervous, from the reflection that this might snap at a critical moment, and a descent upon the chalets or the church-steeple below still be in store. It was only on long, comparatively straight stretches that I really enjoyed the motion; then it was decidedly exhilarating. The trailing boughs occupied the whole width of the road, and raised a cloud of dust. We must have passed like some witches' ride. My fagot, too, made a great roaring; when I passed along by the cataracts, I was inclined to say to myself: "*Tiens!* there's something that's trying to set up a competition with me."

Arrived at last at the Grande Chartreuse, we fell in with a French bicyclist, who announced that an edict was out against riding with the fagot; he had had it from one of the stage-drivers, and was disconcerted in his

plans thereby! I suspect it was only the invention of the stage-driver himself, who opposed the fagot because it scared his horses and raised such an infernal dust.

WILLIAM HENRY BISHOP.

THE INTERNATIONAL CONGRESS OF MATHEMATICIANS.

ZURICH, August 13, 1897.

Two or three years have passed since the desire felt by many mathematicians for opportunities of meeting with those of other nationalities, in some way that should be free from the inconvenience and small satisfaction attending a formal round of visits, found expression in the suggestion that an International Congress be held at suitable intervals. The suggestion met with ready approval, and it was decided to act upon it. For the first meeting, Paris presented itself as a suitable place, with its claim as the originator of the idea amply supported by the scientific rank of the French mathematicians; but the year 1900, the year of the Exhibition, offered such opportunities for a congress that it was determined to hold the first in 1897 in Zurich, the most central and international spot available, assigning to Paris the congress of 1900. Accordingly, in May of the present year, a committee of organization, composed mainly of the mathematical faculty of the Federal Polytechnic School and Cantonal University of Zurich, issued a circular of invitation and information, summoning the Congress for the 9th, 10th, and 11th of August. Much of the success of the first meeting must be ascribed to the labors of this committee, which made such ample and well-proportioned provision for carrying out the first article of the constitution, in which the objects are presented as four-fold, viz., (*a*) to promote personal relations between the mathematicians of different lands; (*b*) to give, by means of reports and lectures, a general view of the condition of the various branches of mathematics, and to afford the opportunity of treating certain questions of acknowledged importance; (*c*) to deliberate on the problems and organization of succeeding congresses; (*d*) to undertake questions of bibliography, terminology, etc., where an international agreement is necessary.

The felicitous choice of the place gave the meeting a truly international character. Not enumerating the ladies whose connection with mathematics was simply by marriage, but including the few that attended as mathematicians, the number of participants by the evening of the first day was 200, divided as follows among the different countries: Switzerland 53, Germany 40, France 25, Italy 19, Russia 18, Austria-Hungary 16, United States 7, Sweden 6, Denmark 4, Belgium, England, and Holland 3 each, Greece, Portugal, and Spain 1 each. It must always be expected that the country in which the meeting is held will provide the greatest number of attendants; as to the other numbers given, paying due regard to geography, these may be considered fairly representative, except as to the two English-speaking countries. The ten members from these were kept busy explaining that this inadequate representation was due to the meeting of the British Association for the Advancement of Science, just about to take place at Toronto. This excuse, valid for *one* congress, is now worn threadbare, and it is to be hoped that it will not be necessary to discover an equivalent for the next congress, but that America and England will see to it that their numerical representation at the Paris congress be a truer indication of the strength of their work.

The opening meeting of the Congress was appointed for nine o'clock on the morning of August 9, but, for the sake of promoting friendly intercourse from the first, a social gathering took place in the Tonhalle on the previous evening. All that day, in a gray Swiss rain, mathematicians arrived, to the great interest of the inhabitants of Zurich, who turned out in large numbers to inspect; apparently it was supposed that the "Mathematiker" were nearly, if not quite, identical with the "forest-bred performing lions" whose impending arrival and promised performances were announced by posters all over the town. But after the first day not even the red and white button, the open-sesame to all that the committee had provided, excited any special interest. "Êtes-vous Mathematiker?" inquired the truly international porter at the railway station, and then conducted us to the office of the committee of organization, conveniently established in the station. Here many of the members of the committee attended to the necessary business of distributing programmes, enrolling members, and receiving the members' fee of $5. The evening was devoted to the social gathering, where the groups of different nationalities were gradually broken up and intermingled; the difference in language did not seem to impose any barrier to friendly intercourse, though it was noticeable that French was the most general medium of conversation. It was stated later on, by some of the members of the general committee, that diversity of interest within the general domain of mathematics had been really more difficult to allow for than diversity of language.

At the appointed time on the following morning the Aula of the fine building which is the home of the Polytechnic School, was full to the last seat. Prof. Geiser, in the name of the committee of organization, welcomed the Congress to Zurich, referring to the historical importance of Switzerland in mathematics, due to the Bernouillis, Euler, and Steiner. He welcomed the members of the Congress as devoted to the disinterested pursuit of pure science, and, therefore, living in a spiritual world on which the sun never sets. The first business before the Congress was the nomination of a general committee. With a respectful reminiscence of the tower of Babel, the regulations provide that scientific communications may be made in English, French, German, or Italian, the publication of such communications to be in the language of the author, but that the deliberations and resolutions of the Congress may be published in French and German, each of these languages being therefore represented by a secretary, qualified to act as interpreter when necessary. After the nomination of Prof. Geiser as President, with MM. Franel and Rudio as Secretaries, four honorary secretaries, representative of the four languages, were chosen, viz.: MM. Pierpont (Yale), Borel (Paris), E. von Weber (Munich), Volterra (Turin), and the committee was completed by MM. Brioschi (Milan), Hobson (Cambridge), Klein (Göttingen), Mertens (Vienna), Mittag-Leffler (Stockholm), Picard (Paris), Poincaré (Paris, absent), H. Weber (Strassburg). A report was then presented by Prof. Rudio, in the name of the committee, on the purpose and constitution of the Congress.

In addition to this formal business of organization, two addresses were delivered on mathematical questions. To the great regret of all present, M. Poincaré was detained in Paris by a family bereavement, and consequently was not able himself to deliver his address, "Sur les rapports de l'analyse pure et de la physique mathématique"; it was therefore read by M. Franel. Prof. Hurwitz gave a finely proportioned account of the "Entwickelung der allgemeinen Theorie der analytischen Funktionen in neuerer Zeit," including, however, in the "allgemeine Theorie" all such insignificant trifles as analytical geometry. This concluded the business of the opening session; and for the remainder of the day the Congress devoted itself energetically to the first of its four aims. At one o'clock the members sat down to an elaborate banquet in the Tonhalle, diversified by the usual speech-making, and by such pleasing episodes as the sending of greetings to the veterans Cremona and Hermite, both unable to be present. From this an adjournment was made to a gayly decorated steamer, for the programme of the day included a trip on the lake. Two hours of quiet enjoyment brought us to Rapperswyl, the loveliest spot on the lake, with its old castle on the height above the little town—in the courtyard of the castle the monument to Poland, erected "on the free soil of Switzerland" by a Polish exile; there we strolled about until the time appointed for the return to Zurich. We were to have reached Zurich in the midst of a Venetian fête—a characteristic amusement of the gay little town consisting of a procession of illuminated boats, with the accompaniment of fireworks and illuminations along the shore; but, owing to the threatening weather, this part of the programme was postponed to the following evening, when it was carried out with great success.

Tuesday was devoted to the presentation of papers in the separate sections. These sections, with their officers (President, Vice-President, Secretary) were as follows: I., *Arithmetic and Algebra*, Mertens (Vienna), Peano (Turin), Amberg (Zurich); II., *Analysis and Theory of Functions*, Picard (Paris), Brioschi (Milan), Jaccottet (Lutry); III., *Geometry*, Reye (Strassburg), Segre (Turin), Künzler (Zurich); IV., *Mechanics and Mathematical Physics*, Jung (Milan), Zhukovsky (Moscow), Flatt (Basle); V., *History and Bibliography*, Moritz Cantor (Heidelberg), Laisant (Paris), Schoute (Groningen). Naturally the papers that excited most interest were those presented by the best-known mathematicians; and as the sittings of the different departments, though not absolutely coincident in point of time, yet unavoidably overlapped, many members passed from section to section for the sake of hearing H. Weber ("Uber die Genera in algebraischen Zahlkörpern"), Gordan ("Resultante ternärer Formen"), Brioschi ("Sur une classe d'équations du cinquième degré résolubles algébriquement et la transformation du onzième ordre des fonctions elliptiques"), Picard ("Sur les fonctions de plusieurs variables, et en particulier les fonctions algébriques"), Reye ("Neue Eigenschaften des Strahlenkomplexes zweiten

Grades"), Zeuthen ("Isaac Barrow et la méthode inverse des tangentes"). The limit of half an hour imposed on the papers, and enforced with more or less rigor under different presidents, enabled the sections to complete their labors by a late hour in the afternoon, and on Wednesday morning the Aula was again crowded for the concluding meeting. Letters of greeting were read from Cremona, Hermite, and others. Resolutions were adopted that the International Congress of Mathematicians should meet at intervals of from three to five years, in different countries, and that each congress should name at its closing session the date, place, and society in charge of the next meeting. The formal announcement was then made that the next congress would meet in 1900 in Paris, and that its organization was entrusted to the Mathematical Society of France. Questions concerning general reports on the progress of mathematics, and the formal adoption of some scheme of classification, are as yet hardly ripe for more than inquiry; consequently no binding action was taken with respect to these; it is left to the Paris Congress to adopt some definite procedure, with the help of the information that will then be available. Resolutions were, however, presented looking to the formation of standing committees for the purpose of dealing with these matters. Thus the conclusions arrived at, as befits the interim character of the Congress of Zurich, relate mainly to the organization of the series of congresses, without definitely committing the Congress to any particular line of action.

As at the opening general meeting, the business brought forward alternated with mathematical addresses. M. Peano gave an account of the "Logica Matematica," his Herculean attempt to persuade the mathematical world to adopt a purely symbolic mode of expressing its reasoning. Several printed pages of formulæ, apparently stenographic Russian, were distributed among the audience, but in vain did Prof. Peano appeal by name to distinguished members to attempt to read these formulæ. In amusing contrast to this attempt to divest mathematics of all literary interest was the address by Prof. Klein, the apostle of sweetness and light in mathematics, "Zur Frage des höheren mathematischen Unterrichtes," with which the proceedings in the Polytechnic were brought to a close.

The members then assembled at the station of the Uetliberg Railway, where two special trains were in readiness. Half an hour's steep ascent brought us to the hotel near the top of the mountain, where the concluding banquet was held. The return to Zurich was by any of the ordinary trains, and many of us took advantage of this arrangement to remain on the Uetliberg till 10 P. M., watching the sunlight fade away from the Bernese Oberland, stretched out before us in its mighty magnificence, and then turning to see the moon, nearly full, rise over Mont Glärnisch. This was the final act of the proceedings, for on Thursday the mathematicians were dispersed in all directions, leaving Zurich in a steady rain, which simply emphasized our good fortune in the matter of weather; for with the one exception of a sudden rough cold wind which disarranged the Monday evening plans, and caused the Southerners to sigh for the warmth of their own lands, the three days of the Congress were perfect.

And how about the results? To what extent did the Congress realize its ends?

The members evidently felt that the time was short, and they wasted none of it, but worked diligently at making the acquaintance of one another. Occasional reminiscences of past disagreement, personal and international, there might be; but the most obvious and impressive thing was the general air of good fellowship and cordiality that prevailed among these comparative strangers, brought together simply by community of abstract intellectual interest. Strolling among the groups, one found Brill and Noether submitting to a kodak, Zeuthen illustrating a remark by a curve hastily drawn on the smokestack of the steamer, Brioschi winning the hearts of the younger generation by his chivalrous, courteous comprehension, Segre explaining the present marked geometrical tendency in Italian work. The social results of this international gathering were obvious; the indirect scientific results will probably be more valuable than the direct ones, though less easy to appraise justly. The mathematician is unavoidably comparatively isolated, for in any average university there is not room for two of a kind; and if the part of his science that he loves best be intellectually unfashionable, his solitariness may result in depression and stagnation. To estimate the indirect scientific results it would be necessary to measure the stimulus that each receives.

As to the direct scientific results, it rests with future congresses in the series now inaugurated to organize undertakings that shall place beyond all dispute the utility of such gatherings. So far as the mere communication and publication of memoirs is concerned, the Congress affords opportunities differing very little from those presented by the mathematical periodicals; its special scientific *raison d'être* will be found in the promotion of undertakings whose final success depends on concerted action rather than on individual effort. It will be its province to encourage and supervise the preparation of extensive reports on the general progress of mathematics, exercising due care that these preserve a sufficiently international character, and parcelling out the ground in such a way that the collection of reports may form the material for a general history of the mathematics of the period. With its assistance a much-needed universal agreement may be arrived at in the matter of bibliography and classification, towards which so much has been done by the "Commission Permanente du Répertoire Bibliographique des Sciences Mathématiques," ably seconded by the Mathematical Society of Amsterdam through the medium of its indispensable *Revue Semestrielle des Publications Mathématiques*. This question of classification was discussed with a good deal of warmth and interest, and it will be necessary for the Congress to come to some decision at its next meeting, formally recognizing some scheme of classification and lending its support to some bibliographical undertaking.

The question of giving to the series of detached meetings some permanence of character, some organic continuity, will doubtless be considered in 1900, even if it be impossible so early in the series to formulate any means for attaining this desirable end. But whether the congresses are ultimately detached gatherings, or periodic manifestations of a central permanent organization, they will be linked together in the memories of the members by the new friendships then formed, the old friendships then renewed. S.

Correspondence.

THE NEW FRENCH DOCTORATE OPEN TO AMERICANS.

TO THE EDITOR OF THE NATION:

SIR: You have, at various times, published notes and correspondence on the movement in France, aided and encouraged by a committee of American educators, to make the universities of France more accessible and attractive to American students. The main point aimed at has now been gained by the establishment of a University Doctorate, open to students of any nation, France included, and granted on conditions not dissimilar to those required in America and Germany. I am not yet advised what other degrees than that of Doctor of Science are included in the arrangement, but any student desiring to avail himself of the advantages now offered may get further information by addressing Mr. Henry Bréal, 70, Rue d'Assas, Paris. Some details are also given in the following letter from M. Michel Bréal, Member of the Institute, and Chairman of the French Committee.—Very respectfully,

S. NEWCOMB.

WASHINGTON.

PARIS, 20 juillet, 1897.

Monsieur et cher Collègue :

J'ai l'honneur de vous faire connaître un premier et important résultat qui a été obtenu. Je vous serai très obligé de le porter à la connaissance de vos collègues du Comité Franco-américain de Washington.

Jusqu'à présent l'obtention du titre de *Docteur* était subordonnée en France à de telles conditions qu'il était bien difficile à des étrangers de l'obtenir. Même beaucoup d'étudiants français en était empêchés, quoique possédant les connaissances et la capacité nécessaires.

Ces conditions étaient de deux sortes: (1) la capacité scientifique; (2) l'obligation de présenter un certain nombre de diplomes (baccalauréat, licence) préalablement obtenus.

Dans sa dernière session, le Conseil Supérieur de l'Instruction Publique a décidé que les universités françaises pourraient créer un *Doctorat purement scientifique*, pour lequel les diplomes de bachelier et de licencié ne seraient pas exigés.

Ce doctorat, au point de vue scientifique, ne devra pas être moins sérieux que l'autre; mais on sera libre d'y laisser présenter des candidats qui n'auront pas fait toutes leurs études en France, ou qui, les ayant faites, n'auront pas jugé utile d'acquérir les diplomes précédemment mentionnés.

Ce doctorat s'appellera *doctorat universitaire*, pour le distinguer par un nom spécial Il ne donnera pas, comme l'autre, le droit d'exercer des fonctions en France. Mais les universités ont intérêt à ce que le niveau scientifique n'en soit pas abaissé. Le Conseil Supérieur de l'Instruction Publique est d'ailleurs chargé de veiller à ce qu'il garde sa valeur. Les étudiants français, comme étrangers, pourront l'acquérir.

Vous voyez, mon cher Collègue, que le principal obstacle que vous me signaliez vient d'être levé. Il ne nous reste maintenant qu'à souhaiter de voir les étudiants américains user de la faculté qui leur est donnée. Je n'ai pas besoin d'ajouter qu'on leur fera bon accueil. Droit, médecine, sciences, lettres, tous nos cours leur sont ouverts

Veuillez agréer, je vous prie, l'assurance de mes sentiments bien dévoués. MICHEL BRÉAL,
Président de la branche française du Comité Franco-américain.

A NEW PARTY AND A NEW NAME.

To the Editor of The Nation:

Sir: I cannot at all take the view of Mr. Whitman in your issue of August 19 as to a new name for the much-needed new party. In the first place, it is still practically true that the newly-formed Republican party of '54 took a new name; for though the word Republican had been used more than once in American politics, having been borne, though with declining emphasis, by the Democratic party since 1792, and again adopted as "National Republican" by the protective wing of that party in 1828, to give way, however, in 1833 to the name Whig, yet in 1854 it was forgotten, and so virtually a new name. It is safe to say that not one in fifty of the new generation of voters had ever thought of or known the slavery party as anything but the "Democratic" party, and this in spite of the fact that its posters still bore, above the symbol of the sledge-bearing arm of the workman, the legend, "Democratic-Republican." The fight for years had been between *Whig* and *Democrat*, and when the former proved unequal to the struggle in the cause of liberty, a new movement, *with a new name*, was born, to rally to it the nobler elements of both the old parties.

So to-day we want not only a new party, but a new name for it, as earnest that it *is* a new party. We are done with both the old parties, twin Lucifers in their common infidelity to the trusts confided to them and to the splendor of their sometime record. "A plague on both your houses!" we would cry with the devoted souls of '54. The name *Democratic* has been as much polluted for any present use in the new cause as the name *Republican*. Give us a new name! Shall it be Commonwealth party, or the People's party, or the National party, or shall it be a name struck out by some happy accident or inspiration to recall and signalize the common honor and the common benefit to which both the old parties have grown callous? Time will decide, but give us, we pray, not only a new party, but *a new name* for it.—Respectfully yours, C.

Gouverneur, N. Y., August 27, 1897.

Notes.

Houghton, Mifflin & Co.'s fall announcements include the tenth and concluding part of the late Prof. Child's 'English and Scottish Popular Ballads,' put to press by Prof. G. L. Kittredge; 'Old Virginia, and her Neighbors,' in two volumes, closing with Washington's first appearance in history, by John Fiske, whose 'Critical Period of American History (1783-1789)' is to be reissued with rational illustrations; 'The Westward Movement: The Struggle for the Trans-Alleghany Region, 1763-1797,' by Justin Winsor, fully mapped; 'Colonial Mobile,' an historical study, by Peter J. Hamilton; 'France under Louis XV.,' by James Breck Perkins; a Life of Mrs. Stowe, by Mrs. James T. Fields; 'The Life and Times of Edward Bass, First Bishop of Massachusetts (1726-1803),' by Daniel D. Addison; 'A Correspondence between John Sterling and Ralph Waldo Emerson,' edited by Edward Waldo Emerson; 'Hawthorne's First Diary,' edited by Samuel T. Pickard; 'A Dictionary of American Authors,' by Oscar Fay Adams; 'The Memorial to Robert Gould Shaw: Its Inception, Completion, and Unveiling'; a second series of Victor Hugo's Letters, edited by Paul Meurice; 'Gleanings in Buddha-Fields,' by Lafcadio Hearn; 'Gondola Days,' by F. Hopkinson Smith, with his own illustrations; 'Tuscan Songs,' by Esther Frances Alexander, with 108 photogravure copies of the peculiar illustrations from the pencil of the translator; 'The Ruins and Excavations of Ancient Rome,' by Rodolfo Lanciani; 'An Evolutionist's Theology,' by Lyman Abbott, D.D.; 'Nineteenth-Century Questions,' by the late James Freeman Clarke, D.D.; 'Inequality and Progress,' by George Harris, D.D.; 'The Story of Jesus Christ: An Interpretation,' by Elizabeth Phelps Ward; 'Varia,' by Agnes Repplier; 'Talks on the Study of Literature,' by Prof. Arlo Bates; 'Nature's Diary,' a year-book compiled by Francis H. Allen; 'Birds of Village and Field,' by Florence S. Merriam; Burns's Complete Poetical Works, Cambridge (one-volume) edition; 'Poems Now First Collected,' by Edmund Clarence Stedman; 'The Story of an Untold Love,' by Paul Leicester Ford; 'Aaron in the Wildwoods,' by Joel Chandler Harris; 'King Arthur and the Table Round,' from the French of Chrétien de Troyes, by W. W. Newell; the third supplement (vol. iv.) to 'Poole's Index to Periodical Literature'; together with a popular edition of C. P. Cranch's blank-verse translation of Virgil's 'Aeneid,' illustrated editions of Longfellow's 'Evangeline,' Thoreau's 'Walden,' and Charles Dudley Warner's 'Being a Boy.'

Henry Holt & Co. will bring out 'The Federalist,' edited by Paul Leicester Ford; 'The Italians of To-day,' by René Bazin, translated by William Marchant; 'Journey through France,' by H. Taine, and a new four-volume edition of his 'English Literature,' with portraits; 'An Introduction to American Literature,' by Henry S. Pancoast; 'The Non-Religion of the Future,' from the French of M. Guyau; 'The Evolution of the Idea of God,' by Grant Allen; 'The Evolution of the Aryan,' by Rudolph von Ihering; 'An Outline Introductory to Kant's Critique of the Pure Reason,' by Prof. R. M. Wenley of the University of Michigan; and 'Selections from Matthew Arnold's Prose,' by Lewis E. Gates of Harvard.

T. Y. Crowell & Co. will publish Baron Coubertin's 'Evolution of France under the Third Republic,' translated by Miss Hapgood; the sixth volume of Sybel's 'Founding of the German Empire'; 'Gen. Grant's Letters to a Friend,' edited by Gen. J. G. Wilson; and 'Ballads of Yankee Land,' by William Edward Penney.

A revised and enlarged edition of Nathan Haskell Dole's variorum edition of the 'Rubáiyat of Omar Khayyám,' is in the press of L. C. Page & Co., Boston. Original drawings by E. H. Garrett and other illustrations will form a part of the novelty.

Roberts Bros. will have ready in October 'The Quest of Happiness,' by the late Philip Gilbert Hamerton; and will also soon bring out a translation, by Prof. E. S. Grosvenor of Amherst, of Theodore Xenos's historical novel, 'Androniké, the Heroine of the Greek Revolution.'

The New Amsterdam Book Co. promise '"The Sixties" (1855-1870),' by Gleeson White, with numerous illustrations in etching, etc., after leading English artists of the period; 'The Actor's Art,' a symposium edited by J. A. Hammerton; 'Women Novelists of Queen Victoria's Reign'; 'Papers by Charles Dickens,' now first collected by Frederic G. Kitton; and 'An Irregular Corps in Matabele Land,' by Lieut.-Col. Plumer.

Palmer & Co., Chicago, and E. R. Herrick & Co., New York, issue jointly 'The Old House, and Other Poems and Sketches,' by Grace Duffie Boylan.

'Famous Problems of Elementary Geometry,' from the German of F. Klein by Profs. W. W. Beman and D. E. Smith, is announced by Ginn & Co.

Gen. Edward McCrady of Charleston has completed the first volume of a History of South Carolina, which he will publish if assured a sufficient number of subscriptions. This volume will end with the overthrow of the Proprietors' Rule in 1719.

Without being an enemy to books and their increase, we can but rejoice that the new budget of catalogues, 'The Publishers' Trade-List Annual for 1897,' requires an even smaller space on our shelves than the last which it displaces. We have noticed ere this, with some regret, that the bulkiness of their lists has constrained certain publishers to furnish for this purpose a *select* catalogue, and otherwise to condense. The invaluable Annual now completes its quarter-century.

The University Publishing Co., in their "Standard Literature Series" for schools, have undertaken abridgments of Swift, Scott, Cooper, Bulwer, and other novelists, and have made extracts, for the sake of Little Nell and Paul Dombey, from the works in which these characters occur. Messrs. Appleton have gone further, in the case of Dickens, and have condensed 'The Story of Oliver Twist' for their "Home Reading-Books," which are also designed for schools. We cannot deem this a service to the schools at least, which have enough to do to teach a pure English style, equally removed from colloquy and from slang. And would not a pupil fresh from the gutter, on seeing Cruikshank's designs of thieves and murderers, court scenes and vulgar kitchen scenes, here reproduced, think he had in hand the familiar literature of the slums?

The real interests of education have been considered in Johnson's Life of Pope, edited by Kate Stephens and published in good shape by Harper & Bros., and in the comely selection of 'Poems and Essays from the Writings of Ralph Waldo Emerson' (Boston: Houghton, Mifflin & Co.).

Mr. Verner Z. Reed's 'Tales of the Sun-Land' (Continental Publishing Co.) is slovenly in style, and is noticeable only for its careful corroboration of the untrue and the absurd. There is room between circumstantial fiction and the pseudo-circumstantial. Mr. Reed's story of "Don" Francisco Casca comes dangerously near the latter; and it is not his only leaning that way. He declares that this wholly absurd tale is proved by "the records left by Vasquez de Coronado," and by a Spanish inscription in the cañon of the Colorado; that it is "a record wrested from that silent . . . desert land." This is overstepping license. Mr. Reed plainly knows as little of the records of "Castenada" (*sic*) as of the expedition and its leader. Nothing could be more unwittingly humorous than the sketch of Coronado—except Mr. Reed's general notions of Arizona geography, and his fundamental ignorance of character among the

Indians and Mexicans he pretends to picture. A few names and terms picked blindfold from some book or some camp-following Ute he unflinchingly naturalizes in every native vocabulary with which he has to do between Colorado and Yucatan; even as he puts Spanish (his version of Spanish) in the mouths of New Mexican tribes before Columbus. It is not so culpable that Mr. Reed knows nothing intrinsic of the Pueblos and their neighbors: he follows in the footsteps of more or less illustrious predecessors. But none who knew so little has matched his craft in seeming to know all. The illustration, by L. Maynard Dixon, is, despite some curious anachronisms, much the most creditable part of the book.

"The Duodecimos," faithful to their name, have preserved the form of their first venture ('Poor Richard's Almanack for 1733'), but have greatly increased the bulk in their second, 'The Poems of Anne Bradstreet' (1612-1672). The editing has been wise in that none of the early faulty editions has been slavishly followed, but the text has been modernized, so that if one now wishes for historical or other reasons to read the verse of the "Tenth Muse," it can be done with ease. The age of Mrs. Bradstreet produced, on this side of the water, nothing from the male sex in the way of poetry to make the Rev. Nathaniel Ward's doubts whether a woman could have written her pieces seem like flattery. Her learning, no doubt, counted for something in this astonishment. Moreover, she was to be the ancestress of the poets Dana and Holmes, and a kinswoman of Prof. Charles Eliot Norton, who furnishes a pious introduction of a very charming kind, and has lent one of the Dudley portraits for reproduction with the others that adorn this volume, including Gov. Bradstreet, Gov. Winthrop, John Cotton, Du Bartas (Mrs. Bradstreet's great model), etc. The book is beautifully manufactured in the prescribed edition of 144 copies.

The late volumes in the series "Pour les jeunes filles" (Paris: Armand Colin & Cie.) are a singular contrast in the material offered to young girls. 'M. le Neveu,' by Jean Thierry, is bright and clear, with a determined action, and is written in very pretty French. The fresh young girl, Dilette, is much alive, and would be a healthy acquaintance for any one. We rather begrudge the title of the book to the excellent but dull "M. le Neveu." The other volume, 'Les Trois Filles de Pietor Waldorp,' is slow, uncertain in aim, and heavy and stilted in language. It can easily be put with another work of the same author, Jean Bertheroy, 'Le Double Joug,' which is one of the books to be put quickly in the fire. This, be it understood, is not in the same series—it is for quite a different audience; but how can readers be found for such writing? It has no purpose, and is excessively irritating because of the utter weakness of the characters.
